HAHN SHOES

90 YEARS IN WASHINGTON-BALTIMORE AREA

WASHINGTON MARYLAND VIRGINIA

Bamadex® Sequels®

Contraindications: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised; especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of pre-existing symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dose—operation of motor vehicles, machinery or other activity requiring alertness should be avoided. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia, the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor, and respiratory collapse.

First aid for a button popper

Second aid for a button popper

Bamadex® Sequels®

d-amphetamine sulfate (15 mg.) and meprobamate (300 mg.)
Sustained Release Capsules

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients makes possible convenient one-capsule-a-day dosage.

DEPARTMENT OF HEALTH

STATE OF MARYLAND

William J. Peeples, MD, MPH, *Commissioner*

Highlights

MEDICARE CERTIFICATION

Under Title XVIII, the Department is charged with ascertaining which hospitals, nursing homes, home health agencies, and independent laboratories meet the conditions of participation in the Medicare program and with making recommendations to the Social Security Administration. Participation of hospitals, home health agencies, and independent laboratories begins on July 1. For extended care facilities, participation begins on January 1, 1967.

The Bureau of Medical Services has been working intensively with general, chronic disease, mental, and tuberculosis hospitals to get as many as possible recommended for certification by May 31, the deadline set by the Social Security Administration for participation by July 1. The major problems are in ascertaining that the 19 institutions not accredited by the Joint Commission on Accreditation of Hospitals take steps to substantially meet the conditions for participation. Each hospital must have a utilization review plan functioning by July 1. The operation of the plan is a responsibility of the medical profession and must have the approval of the medical staff as well as that of the governing body of the hospital.

Home health agencies, which initially will be limited mainly to local health departments, are now being urged to apply for participation and take actions necessary to qualify for certification.

The Bureau of Laboratories is working with independent laboratories to help them gain certification.

Work on extended care facilities is in the initial stages, which will be intensified after the peak load of work on other providers of service is accomplished.

PESTICIDES IN FOODS

The laboratory determination of pesticide residues in foods is complex because of the variety of food products and the number of substances and minute quantities of residue that may be involved. During 1965, the Bureau of Laboratories examined 425 samples of milk and 174 samples of other foods. When elevated quantities were found in milk, the production of the dairy involved was placed under closer surveillance and, in some instances, excluded from market. In the vegetables—lettuce, cabbage, endive, tomatoes, broccoli, and other greens—the quantities found were below tolerance levels. No significant levels were found in samples of oysters, clams, hamburgers, or hot dogs. The group of pesticides detected in any amounts was the chlorinated hydrocarbons (DDT, Aldrin, etc.); none of the organophosphates (Malathion, etc.) was detected, possibly because of lack of specific equipment. The continuance of the surveillance program is of significance in the accumulation of detailed knowledge of our chemical environment and provides a guide to the development of laboratory capabilities.

INTERAGENCY CONFERENCE ON SCHOOL HEALTH PROBLEMS

Representatives from 17 local health departments and departments of education attended the Maryland Conference on Critical School Health Problems: Smoking and Drug Addiction, sponsored jointly by the Maryland State Departments of Education and Health, in cooperation with

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

in chewable tablets

in granules for oral suspension

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets
In Granules for Oral Suspension

ERYTHROCIN®-SULFAS
Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

ABBOTT

the state Cancer Society, the Heart Association, the Tuberculosis Association, and PTA. The all-day conference was attended by representatives from the Department of Catholic Education and the teacher-training institutions of the state.

At the conference, the Maryland Committee on Smoking and Health distributed copies of the resource unit on Smoking and Health for Grades 7 through 9. This unit is the second of a series of teaching aids developed by the Committee to assist in teaching the adverse effects of cigarette smoking on health. The first aid, for Grades 5 and 6, was developed last year and has been widely distributed throughout the state.

NUTRITION IN MATERNITY PROGRAMS

A conference on nutrition in maternity programs brought 30 persons from state and local health departments to the central office to discuss ways to provide the best use of nutrition services in maternity programs. Guidelines were formulated to help the nutritionist function more effectively as a part of the health team serving the maternity patient.

Tuberculosis Tests for School Personnel

A new program of testing for tuberculosis among public school personnel was instituted April 18 by the City Health Department's Division of Tuberculosis. This step in the control of tuberculosis in the city was approved by the Board of School Commissioners on March 3.

Testing of school staff for tuberculosis will be by the tuberculin test, a chest x-ray, or both if indicated. It will be initiated in the schools by public health nurses using the tuberculin test. Reactors to the tuberculin test and those who for any one of a number of reasons omit the tuberculin test will be required to have a chest x-ray. Individuals who so desire may forego the tuberculin test and have a chest x-ray only.

Chest x-rays are available without charge at the Maryland Tuberculosis Association or at any of the four Baltimore City Health Department chest clinics. Those who wish to do so may have the test performed by their private physician, and those who can produce acceptable evidence of examination since September 1, 1965, need not repeat the tests at this time.

There is no evidence to suggest that tuberculosis is more prevalent among school teachers and other school staff than it is in the general public. However, as we know, when an infectious case does occur in a staff member in a school, there is greater opportunity for passing on the infection to the children. This did occur in a nursery in Detroit and was reported in the local newspaper this year on January 19.

About half of the newly reported active cases of tuberculosis occur in persons 45 years or older, most of whom have carried a dormant infection for years. Our current objective is to prevent infection of young children so that they will not develop disease.

The new tuberculosis testing program is under the supervision of Allan S. Moodie, MB. For further information on this program or any aspect of the Department's tuberculosis control work, call 752-2000, extension 2557.

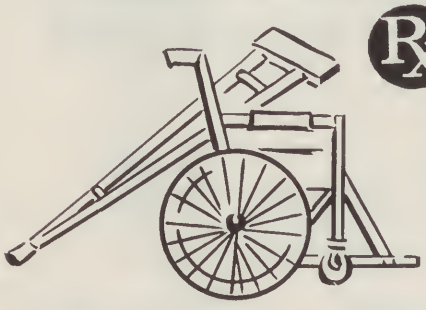
Employee-Patient Ratios

The ratio of employees to patients in Maryland's four major psychiatric hospitals* has more than doubled since 1950. As shown in the following table, this change has been caused by an increase in the number of employees. The average size of the patient population in these hospitals, which increased until 1955, has since declined to approximately the same level as in 1950.

FISCAL YEAR	AUTHORIZED POSITIONS	AVERAGE SIZE OF PATIENT POPULATION	EMPLOYEES PER 100 PATIENTS
1950	1,719	7,844	21.9
1960	3,225	8,516	37.9
1964	3,553	7,821	45.4
1965	3,675	7,850	46.8
1966	3,784	7,836 (nine months)	48.3

This change is due, in part, to a fourfold increase in admissions (from 1,953 in 1950 to about 8,600 in 1966) and a sixfold increase in discharges (from 1,233 in 1950 to about 7,800 in 1966). Related to this has been a gradual decrease in the proportion of beds occupied by chronic patients and a concomitant increase in the proportion occupied by the acutely ill. Sixteen years ago, 65% of all patients had been hospitalized five years or more, 20% had been under care between one and five years, and the remaining 15% were hospitalized less than one year. These percentages are now 50, 25, and 25, respectively. Patients hospitalized for the short-term treatment of acute disturbances require much greater staff services than do chronic patients hospitalized for extended periods.

Statistics on employee-patient ratios should be approached with caution since they do not necessarily indicate the employee's function. For example, one-third of the Department's psychiatrists are either engaged in an administrative capacity or in the treatment of outpatients. Thus, although available statistics indicate one psychiatrist for every 70 hospitalized patients, the ratio of psychiatrists primarily engaged in hospital patient treatment to the number of patients is actually one to 105. Further, these figures vary substantially and are influenced by the size of the hospital.



Available data indicate that the number of admissions will continue to increase. This can be expected to produce a gradual rise in the proportion of beds occupied by acutely ill patients receiving short-term treatment. Based on these data, a continuing increase in employee-patient ratios is indicated to maintain the present level of services.

* Crownsville, Eastern Shore, Springfield, and Spring Grove.

A special safety citation was made to the Medical and Chirurgical Faculty by the Maryland Traffic Safety Commission. President-elect J. Morris Reese, MD, received the award on behalf of the Faculty. The award was presented by Governor Tawes on February 21 at a luncheon meeting commemorating Hospital Appreciation Day.

THE MEANING OF CONDOMINIUM

WILBURN L. McCLURE, JR.

There is much discussion these days concerning investments in medical centers. A relatively new term, "condominium," needs to be explained as it might apply to the physician investor.

Condominium means you own your office just as you would a home. It means you own space in a building where others also own space. You own fee simple title (absolute ownership) to the air space within the finished and unfinished surfaces of the ceiling, floors, and walls of your office unit. In some cases it could mean you own parking space underground or on an outside parking lot.

You own a percentage interest in all the common areas and facilities of the office building. You own a share of the land on which the building is located; the foundations, columns, girders, beams, supports, main walls, roof, halls, corridors, lobbies, stairs, stairways, fire escapes, and entrances and exits of the building.

You own a share of the central service installations for power, lights, gas, cold and hot water, heating, air conditioning and incinerating. You own a share of the elevators, tanks, pumps, motors, fans, compressors, ducts, generators . . . all apparatus existing for common use.

You are in every respect an owner (landlord) of real estate as opposed to a renter (lessee) of space or, as in a cooperative, a shareholder in a corporation with the right to occupy a specific office.

Following is a discussion of the *five important advantages* of condominium ownership over shareholding interest in a cooperative.

LIABILITY.—Every shareholder of a cooperative is liable for the default of any other shareholder. If a shareholder in an office fails to pay his share of the building's mortgage, taxes, and maintenance, this obligation must be met by the other shareholders.

In a condominium, you are NOT liable for the default of your neighbor. You are NOT financially entangled with other occupants of the building. You are responsible for only your own mortgage payments, tax bills, and share of the common maintenance.

INDEPENDENCE.—A shareholder in a cooperative requires permission from the other shareholders before he can sell or lease his office. Further, the prospective buyer must be approved by the other cooperative office owners.

FINANCIAL FREEDOM.—There is little financial flexibility in a cooperative. A single mortgage covers the entire project. A prospective tenant in a cooperative office project must accept the terms of the mortgage or reject participation.

As the owner of a condominium, you are free to manage your own financial affairs. You may arrange for your own financing on whatever terms suit you best. You may refinance your debt when you choose. You may prepay your mortgage if you wish. In fact you can pay the whole purchase price in cash and have no mortgage if you desire.

TAXES.—In a cooperative, the enterprise is taxed as a whole and members then pay their share of the levy.

In a condominium, each unit is assessed and taxed separately. You are taxed only for what

you own individually and your share of the jointly owned facilities and services. Of course, you are entitled to claim payments of mortgage interest and property taxes as professional income tax deductions as all office owners do. Your tax savings alone can reduce your monthly payments in many cases by as much as 50%

MANAGEMENT.—In a cooperative, the corporate officers, usually the developers and builders, maintain management control, set the rules, determine financing, designate the cooperative's policies, practices, and restrictions.

In a condominium, your rights and the rights of the other owners are specified in your individual warranty deed. This describes the method of managing and maintaining the building, prohibits office speculation, establishes the formula for prorating each owner's share of common expenses, allows you the right to examine management books at any time. All condominiums are managed by a management corporation controlled by a management committee comprised of the office owners.

So far only advantages have been discussed. What about disadvantages? In any business venture there are bound to be pitfalls. One example: Suppose some owners want to repaint common areas, but you disagree. If the management committee votes for it, you will have to go along with them whether you want to or not.

Now, some straight dollars and cents answers to the usual questions about office ownership in the condominium professional building:

Q. How is my share of ownership in common areas and facilities determined?

A. It is determined by taking the value of your office unit as a basis in relation to the total value of all the units in the building.

Q. Who pays for insurance on the building and the individual unit?

A. The management committee of office building owners will obtain fire insurance and other necessary insurance on the entire building, and premiums will be part of your common expenses. The insurance will be written in the name of the management committee and will be shared by you and all other owners. In addition, each unit will have an individual owner's policy to protect his personal responsibilities.

Q. Who pays for decorating, repairs, and changes to the building?

A. These payments come from the common expense funds.

Q. Am I responsible for common expenses on any other office?

A. No. The owner is only obligated to pay the proportionate share of common expense on his own office.

Q. How are common maintenance costs determined.

A. Common maintenance costs are based only on the actual cost of operating the property. Due to shared expenses, maintenance costs are at a minimum. Your management committee will meet once every six months to work out budgets and provide cost reports to all owners.

Q. What items of condominium ownership are tax deductible?

A. Both federal and state tax laws allow you, as an owner, to deduct interest and real estate taxes from your professional income. Since you use it as your professional business office, you earn a proportionate depreciation deduction from your income tax.

Q. How much of a down payment is usually expected?

A. You may pay as little as 10% of the total purchase price with the remainder assumed on mortgage, or you may purchase your space outright.

Q. What savings do I enjoy through condominium ownership?

A. In addition to substantial tax savings, you save by paying no landlord profit. You save by paying lowest possible maintenance costs. You save by arranging individual financing at more favorable rates and terms than afforded builders and developers. You save by eliminating the waste and inefficiency possible when management is not controlled by the office owner.

Book Reviews

THE SOCIAL RESPONSIBILITY OF OBSTETRICS AND GYNECOLOGY, by Allan C. Barnes, MD. The Johns Hopkins Press. $5.95.

This book is composed of proceedings of a conference held May, 1965, at The Johns Hopkins Hospital. It is divided into six subsections, which are, respectively: The Quantity of the Next Generation; The Quality of the Next Generation; The Control of Neoplasia; The Law; The Agencies; and The Individual.

Eight of the 14 contributors are on the faculty of The Johns Hopkins University School of Medicine. This plus the addition of a succinct statement of the legal dilemmas facing obstetricians in Maryland by the former president of the Maryland Bar Association and an enlightening paper on "Sex Education in Baltimore City Schools" by the president of the Baltimore City School Board make this volume of particular interest to Maryland physicians.

Contributions by a representative of the Population Reference Bureau in Washington, a faculty member from the Bowman Gray Medical School, a representative from the American Cancer Society, and a chairman of department from the University of Rochester adequately attest the national concern on the part of obstetrician-gynecologists for the pressing sociological problems which are parametrical to or directly related to the discipline of this specialty.

Each subsection is introduced by Dr. Barnes in his usual erudite, succinct, and to-the-point manner. The component subjects in each section have obviously been carefully chosen and are delivered by people well qualified to express opinions in their particular field. The material ranges from an initial no-nonsense statement of the magnitude of the worldwide population crisis by Mr. Robert C. Cook, through an excellent paper by Ethel M. Nash on "Divorce and Marriage Counseling," to a thoughtful paper by Dr. John Ramano on necessary changes in graduate and undergraduate medical training, which must ultimately reflect changes in traditional obstetric and gynecologic teaching if we are to successfully approach the problems that society expects us to answer. The multiplicity of problems of this nature which were once tangential to obstetrics and gynecology but now confront it could provide material for a volume many times the size of this little book. The respective authors are to be congratulated on keeping their material brief and thought-provoking.

It is unfortunate that the enthusiasm expressed by Clifton B. Read for the Home Test Irrigation Kit for cervical cancer must be tempered by the recent disclosure of the disappointing statistics in reference to patient acceptance. This, however, in no way detracts from the general value of the volume.

No attempt was made to solve the serious questions facing us. The stated goal of setting forth the problem, exploring it, and delineating it has been accomplished.

I particularly appreciate the concluding paragraph in the epilogue:

"We are, in a sense, a society of the walking wounded, collectively over-crowded and individually hurt and the correction of the situation is the urgent task to which we should commit our thoughtful energies. The time to start was yesterday."

The book is recommended not only for obstetrician-gynecologists but for all physicians. It ought to be required reading for those now in Ob-Gyn residency programs or those contemplating practice in obstetrics and gynecology.

L. Louis Mould, MD

FAMOUS MODERN MEN OF MEDICINE, by Caroline A. Chandler, MD. Dodd, Mead & Co. $3.25.

Caroline A. Chandler's book, *Famous Modern Men of Medicine*, is an exceedingly dull group of biographies of great modern doctors. Included are such physicians as Howard A. Rusk, Paul Dudley White, Anna Freud, and Helen Taussig and Alfred Blalock. Despite the basically engrossing subject, Dr. Chandler has managed to ignore all good approaches. Instead she has written, and poorly, an easily forgettable book.

The biographies are supposedly for the teenage reader with an interest in medicine. Apparently, however, Dr. Chandler knows only teenagers of the below average reading level, for the treatment is one of simplified baby-talk.

Most of the book is composed of quotations from "personal interview with author" notes, a fact which the author points out at every available opportunity. Moreover, Dr. Chandler makes mistakes that an average reader would soon pick up. She compares Leonardo da Vinci, a fifteenth century Italian Renaissance man, with William Montague Cobb, describing them as "thirteenth century-style, all-around 'complete' men." Her worst error is slanderous in content. Dr. Chandler describes Benjamin Spock as being "as far removed from babies in physical appearance as he is close to them intellectually and emotionally." Is Dr. Chandler trying to tell us something?

As pure encyclopedic reading, *Famous Modern Men of Medicine* can be recommended. However, for the reader who wants to enjoy a book as well as learn, this book is not the one to get.

Hilary Sargeant

Editor's Note: Miss Sargeant is a senior at Eastern High School.

COMMUNITY MENTAL HEALTH SERVICES IN NORTHERN EUROPE, U.S. Department of Health, Education, and Welfare. $1.75

This is an account of Sylvan S. Furman's observations of mental health programs, in Great Britain, Netherlands, Denmark, and Sweden, written under contract with the National Institute of Mental Health. It offers some selective observations that the author thinks might be helpful and interesting to the American reader, particularly those interested in community mental health planning.

Specifically, the purposes of this report are: 1) to provide concise information about systems of care for the mentally ill in the countries visited, the varieties of such systems, and how the parts of the system are administratively related; 2) to show how the systems of care relate to the basic public health, medical care, and social welfare systems of the respective countries; 3) to suggest how some of these systems and methods may be adaptable to local needs in America.

AN ATLAS OF FINE STRUCTURE: THE CELL, by Don W. Fawcett, MD. Saunders, 1966. $11

This is one of a projected series of atlases of fine structure incorporating the new knowledge made possible by the electron microscope. It is intended as a laboratory manual for students in cell biology, histology, and cytology, rather than as a textbook or a reference. It is primarily a book of illustrations with a minimum amount of descriptive text.

MEDICAL PHARMACOLOGY, ed 3, by Andres Goth, MD. Mosby, 1966. $12.50

This book is intended as a concise text for students and physicians. To achieve his goal, the author has eliminated the many details of interest only to the professional pharmacologist. He emphasizes those areas of pharmacology that are expanding and are contributing the most to modern medicine. One new feature of this edition is a separate grouping of recent reviews at the end of chapters.

This "case history" runs to some 10,000 pages

This is a typical "case history" of one new drug—or, rather, a proposed new drug—assembled for submission to the U.S. Federal Food and Drug Administration. These volumes are the result of several years' work by thousands of professional and skilled personnel in just one pharmaceutical company's research laboratories, and by hundreds of physicians in medical schools, hospitals, and private practice. They cover every aspect of experience with this proposed new agent from chemical laboratory to clinic, from mouse to man. Each volume could conceivably represent hundreds of thousands of dollars of financial investment, countless hours of human effort. This veritable mountain of data stands behind every new agent offered to you by pharmaceutical manufacturers—a reassuring testimonial to the efficacy, safety and purity of the drugs you will prescribe today to lower the cost of disease to your patients.

5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction

...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

The Somatic Mask: chest pain

heart disease or psychic tension?

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

Neurotic fatigue—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be controlled by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

In prescribing: Dosage—Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

BSP® DISPOSABLE UNIT

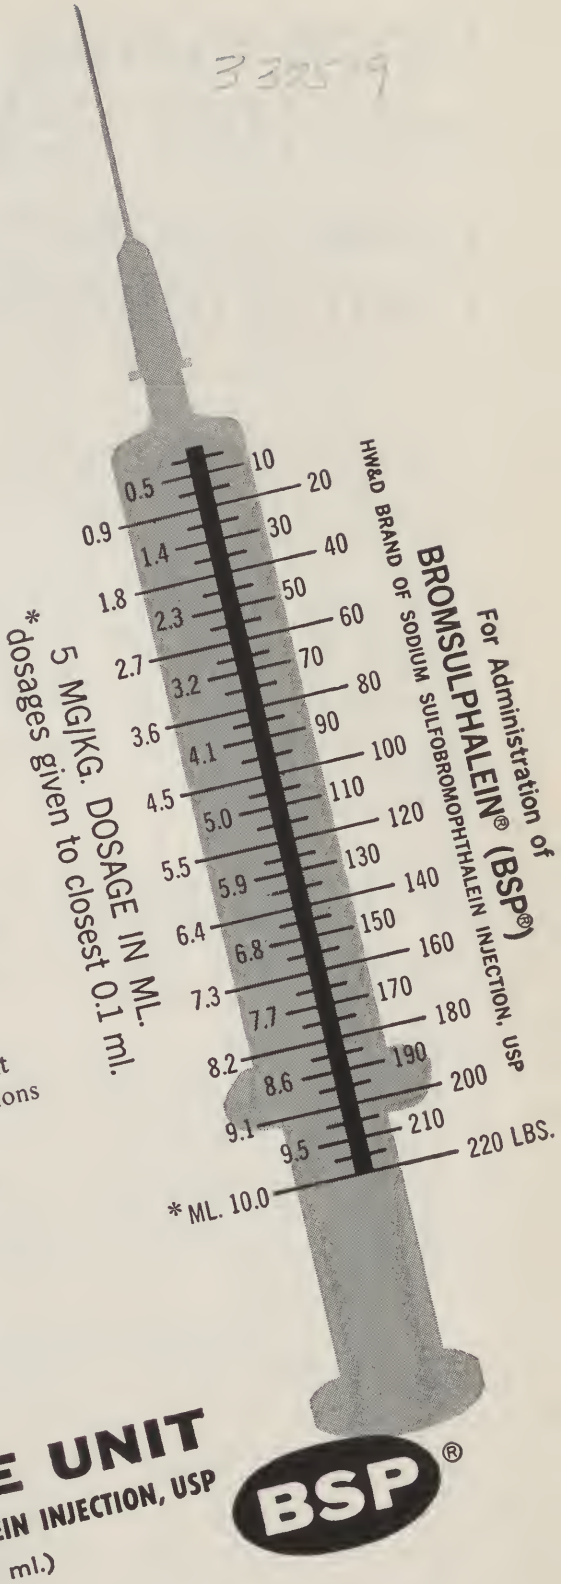
A RELIABLE, PROVEN PRODUCT . . .

The BSP test, introduced in 1925, remains one of the most sensitive laboratory procedures available for determining hepatic function.



A STERILE, CONVENIENT PUT-UP . . .

Each BSP Disposable Unit contains: a sterile, glass, disposable syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of Bromsulphalein.

The BSP unit is designed for maximum patient protection. The precalibrated syringe makes weight calculations unnecessary and provides for proper dosage regardless of patient-weight.

ECONOMICALLY PACKAGED . . .

Prepared for economic unit dispensing, this completely disposable put-up affords a savings in time and labor—the most costly commodities.

BSP® DISPOSABLE UNIT

HWD

Once merely a man with HAY FEVER— now a victim of his own antibodies

Whatever term describes him in this new era of immunology, the symptoms of congested nose, rhinorrhea and sneezing haven't changed in patients hypersensitive to pollens and molds. But NTZ® Nasal Spray relieves the symptoms. It decongests nasal membranes on contact, relieves itching and reduces excessive rhinorrhea without unpleasant dryness. The first spray of well-tolerated NTZ shrinks the turbinates, helps restore normal nasal ventilation and breathing. After a few minutes, a second spray enhances sinus ventilation and drainage.

More than a simple vasoconstrictor, the carefully balanced formula of effective components relieves in three ways with:

- **N**eo-Synephrine® HCl 0.5%, a decongestant of unexcelled efficacy to shrink nasal membranes and allow more comfortable breathing.
- **T**henfadil® HCl 0.1%, a topical antihistamine to help relieve itching and rhinorrhea.
- **Z**ephiran® Cl 1:5000, an excellent wetting agent and antiseptic preservative to promote the rapid spread of components to less accessible nasal areas.

Supplied in convenient pocket-size plastic spray bottle of 20 ml. Also available as a solution of 30 ml. (1 fl. oz.) with dropper, and 473 ml. (1 pint).

Prescribe NTZ® Nasal Spray

(contains Neo-Synephrine HCl)

MEALS ON WHEELS KITCHEN OPEN IN CATONSVILLE

The Commission on the Aging in Baltimore County has opened its first Meals on Wheels kitchen in the Catonsville area. The county program has received a federal grant of $2,480 through the State Commission on Aging to initiate this program. A hot and cold meal will be delivered each day, five days a week. Clients will pay $7.50 per week for meals, which have been planned by nutritionists, prepared by a paid cook, packaged and delivered by volunteers. This program is geared primarily to aging men and women who need this service in order to remain in their own homes; however, any homebound person may qualify for these meals.

A second kitchen is being planned to serve the Towson area.

PLANNED PARENTHOOD ASSOCIATION OF MARYLAND, INC.

"Family Planning & Public Health"

A training program in contraception, the birth control clinic, and the community. Open to physicians, nurses, nurse-midwives, health educators, social workers, public health administrators, and other qualified professionals. Tuition free.

TWO-DAY WORKSHOPS: September 29-30, November 17-18.

TWO-WEEK SEMINAR: September 7-16.

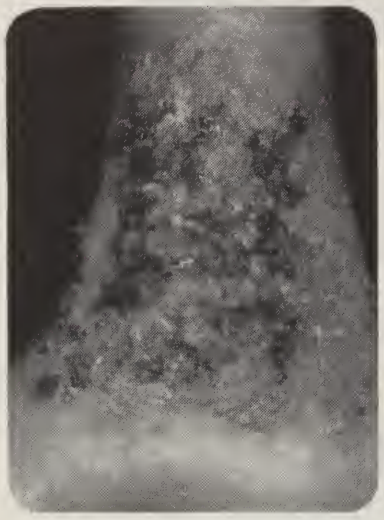
Advance registration required. 517 North Charles St., Baltimore, Md 21201. 752-0131.

HAHNEMANN MEDICAL COLLEGE AND HOSPITAL

July 25-29—Interpretation and Therapy of Cardiac Arrhythmias, Marriott Motor Hotel, Philadelphia

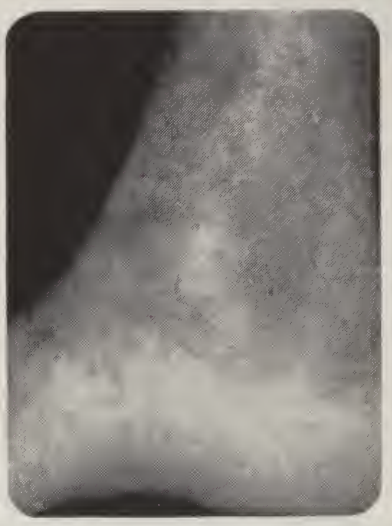
APPLIED OFFICE PSYCHIATRY

A graduate course in office psychiatry is being offered to physicians by the Institute of the Pennsylvania Hospital. It is designed to give the maximum of clinically useful information to the practicing physician who is interested in improving his ability to manage the psychiatric problems commonly encountered in the practice of medicine. In keeping with its emphasis on practical, usable information, theoretical material will be kept at a minimum. The course will consist of 12 four-hour weekly sessions, beginning September 28.



GRADUATE COURSE IN MEDICAL HYPNOSIS

A graduate course in medical hypnosis is being offered to physicians and dentists by the University of Pennsylvania Graduate Division, School of Medicine. It will consist of 20 four-hour weekly afternoon sessions, beginning September 28. It is one of the few courses offered which meets with recommendations made by the American Medical Association's Committee on Hypnosis.



During the first part of the course, basic concepts of hypnosis will be taught through lectures on psychiatry and hypnosis, demonstrations, and supervised practical work in hypnosis. Later sessions will cover clinical applications of hypnosis. There will be sessions limited to psychiatrists and other sessions limited to general practitioners, dentists, and specialists other than psychiatrists.

Both courses will be given at the Institute of the Pennsylvania Hospital, 111 North 49th Street, Philadelphia, Pa 19139. For further information, write to: Sydney E. Pulver, MD, at this address.

eczema: scourge of childhood

R. R., Age 11—Before treatment—atopic eczema of long standing

After treatment—with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of childhood eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attend with caution and observation, bearing in mind the potent spreading of infection and the advisability of discontinu therapy and/or initiating antibacterial measures. Generaliz dermatological conditions may require systemic corticoste oid therapy. Steroid therapy, although responsible for rem sions of dermatoses, especially of allergic origin cannot be e pected to prevent recurrence. The use over extensive bo areas, with or without occlusive nonpermeable dressin may result in systemic absorption. Appropriate precautio should be taken. When occlusive nonpermeable dressin are used, miliaria, folliculitis and pyodermas will sometim develop. Localized atrophy and striae have been report with the use of steroids by the occlusive technique. Wh occlusive nonpermeable dressings are used, the physici should be aware of the hazards of suffocation and flamm bility. The safety of use on pregnant patients has not be firmly established. Thus, do not use in large amounts or long periods of time on pregnant patients.

Packages: Tubes of 5 Gm. and 15 Gm.; ½ lb. jar.

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

OCEAN CITY MEETING

MEDICAL AND CHIRURGICAL FACULTY

Friday, September 9, 1966

at

DIPLOMAT MOTOR HOTEL

Boardwalk at 26th Street
Ocean City, Maryland

A real opportunity for a week end to get together with old friends and meet new friends!

Purchase Your Vacation Home Now

at OCEAN VILLAGE

(exciting new ocean front community near Bethany Beach, Delaware)

OCEAN VILLAGE, located on the "beach highway" (Route 14), one mile north of Bethany Beach, is one of the few remaining areas along the Delmarva coast where ocean front house and lot may still be purchased. A carefully planned seaside community, it offers privacy, a great variety of wholesome, healthful outdoor activity and awe-inspiring views of ocean, wide beaches and rolling dunes, yet is only a few minutes driving time from churches, restaurants, shops and stores.

We can assist you in selection of lot and home design, arrange financing, and . . . if you so wish - - provide you with a rental income plan that can make your OCEAN VILLAGE VACATION HOME self-supporting.

Write or call for further information. No obligation.

To The Editor:

I have just read an article printed in the second (February) issue of the *Maryland State Medical Journal* and am very much concerned with particular areas of this article. The name of the article is "Medical Care in a Baltimore Nursing Home," by Douglas G. Carroll, MD, which appeared on page 63.

First, let me say that this article did not represent a cross section of the nursing homes in Maryland. This particular nursing home was closed by the State Health Department because it was not living up to the requirements set forth. In these requirements, this nursing home was licensed for eleven patients and had a total of twenty-four patients when investigated by the State Health Department. This nursing home was not properly licensed and also, at that time, had a temporary license because the Health Department questioned the medical care that was being given to the patients at this home.

In this article, on page 63, it says "It is probable, therefore, that the inadequacy found in this home exists to some extent in all nursing homes." This is an implication that should never be implied, unless further proof can be found. Dr. Carroll took the worst home in Maryland; one that was ostracized by the Nursing Home Association; one that was closed down by the State Health Department, and compared it to the fine, modern, and properly licensed nursing homes throughout the state. Such a situation as described in this article could not easily happen in a properly licensed and administered nursing home in the state.

We have medical records that are up to date on each of the patients in the nursing homes in Maryland, and doctors, in accordance with state regulations, must examine the patients at least once a month. If certain disorders were not discovered at the home, it would certainly be the fault of the patient's physician rather than the nursing home.

I ask that some mention be made, that this nursing home which was compared with other nursing homes in the state, was a nursing home that was below par for all the homes in Maryland.

Whatever you can do to correct this gross interpretation of how nursing homes really are, as presented in this article, would be greatly appreciated.

Thank you.

good reason to select Ilosone® Erythromycin Estolate for bacterial infections

two to four times the therapeutic activity of other erythromycins

CONTRAINDICATIONS: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

SIDE-EFFECTS: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

DOSAGE: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Additional information available to physicians upon request.

About the AMA-ERF

Your AMA-ERF is four years old. It is a very young Foundation which has much to be proud of —and a glance at its record reveals the important activities.

In its brief history, the Foundation

- transmitted more than $1 million a year from physicians and their wives in unrestricted funds to medical schools;
- guided more than $3 million from physicians and industry into $30 million in loans for medical students, interns and residents;
- created the mechanism that channels funds into research on smoking and health;
- supported the Summer Institute for Medical Journalism, which aims at increasing the writing and editing abilities of young physicians;
- established a program in bequests to medical research, a service to bankers and lawyers in guiding their clients' bequests;
- set up the mechanism to accept small contributions to research that by themselves would purchase little but which, when pooled, become capable of sponsoring research projects, and
- in the last year has built and opened the Institute for Biomedical Research, an exciting venture in basic biomedical research.

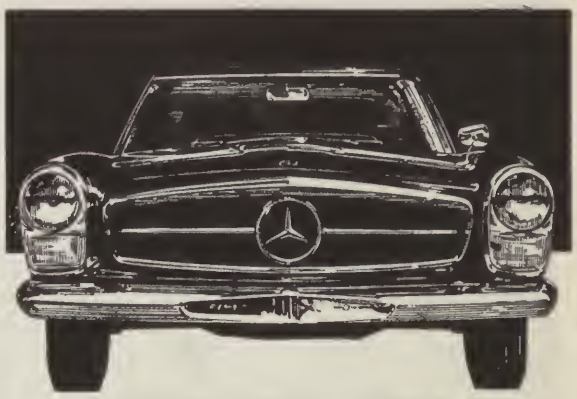
Physically the Institute has space and laboratory equipment in the new addition to the AMA headquarters building. The Institute is designed to provide maximum opportunity for outstanding scientists to devote their full energies to basic research in cellular biology without the distractions of teaching or performing administrative chores.

The facility is supported entirely by private funds.

Five scientists are at work in the Institute, and several more are expected to join them in the near future. Eventually about 25 scientists will be accommodated.

What is ahead for the Foundation? That depends on you. The success of these programs is in the hands of those physicians who endorse them—intellectually and financially. Where do you stand in the fourth year with your Foundation?

Chesapeake Bay Pin — Beautiful!



In this hand-sculptured pin, the glories of the Chesapeake Bay are depicted by a terrapin, oyster, starfish, crab, clam and seahorse.

EXECUTIVE SECRETARY'S NEWSLETTER

July, 1966

SEMIANNUAL SESSION

The Semiannual Meeting is scheduled for Friday, September 9, in Ocean City, at the Diplomat Motel. The schedule of activity is as follows:

8:30 p.m., Thursday, September 8
Council
9:30 a.m., Friday, September 9
House of Delegates
1:00 p.m., Friday, September 9
Crab Feast Luncheon, Phillips Crab House
6:30 p.m., Friday, September 9
Poolside Cocktail Party at The Diplomat
7:30 p.m., Friday, September 9
Dinner Dance, and an illustrated lecture by A. McGehee Harvey, M.D., on "Medicine and the Three Worlds of Peru: Past, Present and Future."

Other groups meeting jointly with the Faculty on Saturday, September 10, include:
Maryland Chapter, American College of Surgeons
Maryland Diabetes Association
Maryland Psychiatric Society

It's not too early to make your hotel reservation. See reservation slip elsewhere in this Journal.

LEGISLATIVE CORRECTION

It was reported in The Assemblyman, Volume IV, Issue 3, page 2, that Senate Bill 61, dealing with a change in the Abortion Law, had been adopted by the General Assembly. This is incorrect as this bill did not pass the State Legislature and died in the last few hours of that session.

NEW INCOME LIMITS FOR MEDICAL CARE PROGRAM

House Resolution 102 adopted by the 1966 General Assembly provides medical indigency income limits for the State budget commencing July 1, 1966, as follows:

One person	$1,800. per annum
Two persons	2,280. per annum
Three persons	2,640. per annum
Four persons	2,940. per annum
Five persons	3,480. per annum
Six persons	3,900. per annum

Each additional person $ 420. per annum

Don't forget increase in office visit fee, effective the same date, to $3.00 from $2.50.

NEWS NOTES

Joseph S. McLaughlin, Baltimore, has been named a Markle Scholar. Markle Scholarships are awarded to a maximum of 25 a year to "help prepare promising young teachers and investigators for positions of leadership in academic medicine."

The Washington-Baltimore Society of Physical Medicine and Rehabilitation have elected the following officers for the 1966-67 year:

Frederick J. Balsam, Baltimore, President
David A. Zohn, Washington, Vice-President
B. Stanley Cohen, Baltimore, Sec.-Treas.

Peter A. Santucci, Bethesda, has been elected Secretary of the Guild of Catholic Psychiatrists.

A new Active Member of the American Society of Anesthesiology is Narciso V. del Carmen, Westminster; and Isagani R. Bernardo, Baltimore, a Junior Member.

ADDITIONAL RESOLUTIONS

Additional resolutions received for consideration by the House of Delegates are:

Resolution 4S/66 - Development of a Program By Maryland Medical Service (Blue Shield) To Pay Reasonable And Customary Fees To Physicians

Resolution 5S/66 - Payment of Reasonable and Customary Fees For Professional Services Under Title XIX of PL 89-97

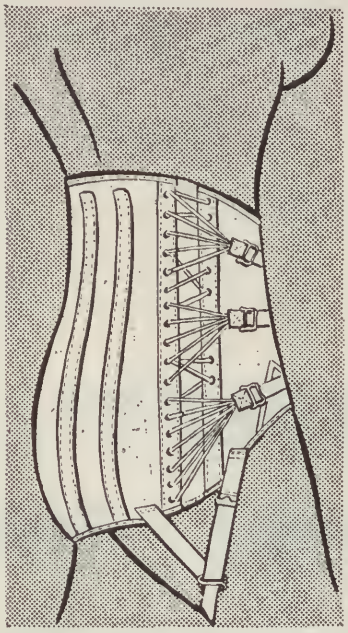
The Reference Committee will meet on Thursday, July 28 at 8:00 p.m., in the Faculty building.

John Sargeant

Executive Secretary

DOCTORS, ask for a demonstration of MERCANTILE-MEDAC . . .

- The best system of medical bookkeeping by computer.
- A complete service backed by this bank's 100 years experience.
- The service that provides doctors with important advantages.



Mercantile-Medac saves doctors' valuable time. It cuts billing and bookkeeping costs, assures accuracy and speeds collections.
It will take only a few minutes for your secretary to learn to operate the compact IBM desk transmitter, which feeds billing and record keeping information to our data processing center . . . And she will be able to transmit an average of 60 transactions in just 15 minutes! After that, Mercantile-Medac does *all* of your bookkeeping and billing, and you get many extra advantages, such as accurate daily, monthly and annual statements for you and your accountant to use as a continuing analysis of your financial progress.
You owe it to yourself to see how Mercantile-Medac works . . . how it can work for *you*. We will be happy to arrange for a demonstration of Mercantile-Medac in your office or in our Computer Services Department, if you prefer.

Why do more Maryland Doctors insure with The St. Paul?

Probably because our Professional Liability coverage is so thorough.

Really broad coverage. Fewer exclusions, so interpretations are no problem. The price is likely to be nice, too.

To get the folder that tells all about it concisely, write.

The St. Paul is the approved carrier for the State Medical Association here... and in more states than any other single insurance company. It must be something we offer!

Want to see just 1 insurance man and still be fully insured? Use our St. Paul Multicover Plan. Same agent as for Liability. He's in the Yellow Pages.

JOHN SARGEANT — EXECUTIVE SECRETARY

House of Delegates, April 26*

1. A moment of silence was observed in memory of deceased colleagues.

2. A motion of the Treasurer recommending a Nominee Form for securities was adopted.

3. Emeritus membership was bestowed on the following physicians: J. Edmund Bradley, MD, and Nicholson J. Eastman, MD, Baltimore City; Mary McK. Cushing, MD, and Robert Hening, MD, Baltimore County; Simon Virkutis, MD, Dorchester County; Manfred J. Gerstley, MD, and Eugene Kester, MD, Kent County; J. Marion Bankhead, MD, Edith H. Weigert, MD, and Naomi Lucius, MD, Montgomery County; H. Dabney Kerr, MD, Talbot County.

4. An additional sum up to $10,000 was appropriated through December 31, 1966, to continue and expand the MEDIC network.

5. Thirteen physicians were honored for 50 years of membership in the Faculty. Pins were awarded to those able to be present.

6. On behalf of the AMA, the President presented plaques of recognition for voluntary service in Viet Nam for 60 day to Robert E. Eby, MD, and Stephen M. Nagy, MD. A plaque is to be presented at a later date to Richard W. TeLinde, MD, who was unable to be present.

7. Various Bylaw amendments were adopted. The text of these may be found in the Minutes and in the report of the Bylaws Committee.

8. Resolutions of the Fee Schedule Committee were adopted, one reaffirming the principle that usual and customary fees be paid to private practicing physicians rendering care to medical care program patients; the other calling for appointment of a subcommittee of the Fee Schedule Committee to deal with PL89-97 matters.

House of Delegates, April 29*

1. The slate of officers proposed by the Nominating Committee was elected unanimously.

2. A resolution supporting separation of professional fees from hospital charges was adopted.

3. A resolution calling for establishment of a School of Medical Technology at the University of Maryland was adopted. Additional recommendations of the Reference Committee concerning implementation of this resolution were also adopted.

4. A resolution proposed by the Montgomery County Medical Society, calling for the Faculty's AMA delegates to introduce a resolution urging each constituent society to establish Medicare Coordinating Committees in their communities, was adopted.

5. M. B. Levin, MD, was granted the privilege of addressing the House. He raised three points of order, which the Chair ruled were not well taken.

*See pages 52-112 for full text of minutes and reports.

SKIN PROBLEMS

Caused by itching due to:

Dry Eczema	Acne
Chafing	Ivy Poisoning
Minor Burns	Cold Sores
Athlete's Foot	Heat Rash
Dry Skin	Diaper Rash

EXECUTIVE COMMITTEE, MAY 19

1. Report was made that an appropriate Faculty group is meeting with Health Department officials to determine fee arrangements under the Medical Care programs.

2. Dr. Russell Nelson is to be invited to discuss with the Executive Committee plans for a proposed satellite of the Johns Hopkins Hospital to be opened in Howard County that would offer prepaid medical care.

3. The Chief, Division of Community Health Services, HEW, attended a portion of the meeting to find out physicians' opinions on maintaining quality of care under PL 89-97. It evolved that physicians are mainly concerned about utilization of physicians' services once the patient has met the $50 deductible and about interpreting the Medicare law to patients. The matter of explaining the law to patients was, in the opinion of the Executive Committee, a matter to be undertaken by HEW or the fiscal carrier, not the physician.

4. The question of whether state legislation should be sought to spell out the fact that the practice of medicine is the responsibility of the physician—not of the hospital —was answered by Faculty's legal counsel. The decision in Illinois, inferring that hospitals were responsible for the practice of medicine in their institutions, was too nebulous to warrant legislative action.

5. The Membership Committee reported on a question which had been referred to it concerning the granting of Physicians' Defense to all associate members. The opinion was that this had not significantly increased the Faculty's legal costs and it was a strong selling point in attracting and retaining members. The Executive Committee concurred in the recommendation that this provision of the Bylaws should remain.

6. Suggestions were made for gubernatorial appointments of physical therapists to the Board of Physical Therapy Examiners.

7. Members of the Building Committee are to be polled with the suggestion that this Committee be disbanded and custody of funds be turned over to the Treasurer, to be maintained in separate Building Fund accounts.

8. A report was made of discussions concerning rules and regulations for laboratories to be promulgated by the State Health Department. The only question not resolved was what did or did not constitute solicitation under the terms of the law.

9. The State Health Department is to be asked to incorporate in its proposed rules and regulations the ethical standards with respect to solicitation and advertising as adopted by the Faculty's Council.

10. Approval was given to sending a letter from the President to all members advising them of their obligations in connection with the battered child law and the laboratory rules and regulations.

11. No recommendation is to be made this year for the Governor's Award to a Physician for Promotion of Employment of Physically Handicapped. In the future, recommendations are to originate from the Occupational Health Committee and be presented to the Council.

12. Approval was given to having a staff member attend sessions of the Advisory Council on Heart Disease, Cancer, and Stroke.

13. The practice of holding joint meetings with the Executive Committee of the Hospital Council is to be continued.

14. The following recommendation of the Fee Schedule Committee was approved: That permission be requested from the Executive Committee or Council to approach "A Continuing Committee to Study the Medical and Surgical Fees Applicable to Workmen's Compensation" with a view to discussing payment of the usual and customary fees, as defined by the Medical and Chirurgical Faculty, for all Workmen's Compensation cases.

15. J. Morris Reese, MD, was appointed to the Advisory Committee, Community Information and Referral Service, Health and Welfare Council of the Baltimore Area, Inc.

16. A resolution from the Louisiana State Medical Society urging all other state societies to initiate a program of collecting drugs and medical supplies for Viet Nam is being referred to the Woman's Auxiliary.

Anatomy of
Low Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered f
prolonged sitting at desks, pianos, typ
writers and drafting boards. The stress
set up by the heavy, forward-tilted he
and trunk, balanced precariously on
insufficient base, result in strain of t
dorsal musculature, particularly at t
low lumbar level.

*The unusual muscle-relaxant and an
gesic properties of 'Soma'* make it esp
cially useful in the treatment of low ba
sprains and strains. 'Soma' is wide
prescribed ☐ **to relieve pain** ☐ **to rel
muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management
muscle spasm, pain, and stiffness in a variety
inflammatory, traumatic, and degenerative mus
loskeletal conditions. It also may act to normal
motor activity in certain neurologic disturbanc

Contraindications: Allergic or idiosyncratic re
tions to carisoprodol.

Precautions: 'Soma', like other central nerv
system depressants, should be used with caut
in patients with known propensity for taking
cessive quantities of drugs and in patients w
known sensitivity to compounds of similar che
cal structure, e.g., meprobamate.

Side Effects: The only side effect reported with
frequency is sleepiness, usually on higher t
recommended doses. An occasional patient r
not tolerate carisoprodol because of an individ
reaction, such as a sensation of weakness. Ot
rarely observed reactions have included dizzine
ataxia, tremor, agitation, irritability, headache,
crease in eosinophil count, flushing of face,
gastrointestinal symptoms.

One instance each of pancytopenia and le
penia, occurring when carisoprodol was ad
istered with other drugs, has been reported, as
an instance of fixed drug eruption with carisopro
and subsequent cross reaction to meprobam
Rare allergic reactions, usually mild, have inclu
one case each of anaphylactoid reaction with r
shock and angioneurotic edema with respira
difficulty, both reversed with appropriate ther
In cases of allergic or hypersensitivity react
carisoprodol should be discontinued and appro
ate therapy initiated. Suicidal attempts may
duce coma and/or mild shock and respira
depression.

Dosage: Usual adult dose is one 350 mg. ta
three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tab
and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

Wallace Laboratories, Cranbury, N

SURVEILLANCE FOR ARTHROPOD-BORNE ENCEPHALITIS IN MARYLAND

PAUL D. STOLLEY, MD
JOHN H. JANNEY, MD
J. M. JOSEPH, PhD

This is the mosquito season and the time to be alert for viral encephalitis. The Maryland State Health Department is conducting a surveillance program and has issued instructions for collecting specimens for laboratory examination. One known case occurred in Maryland last year and is reported here.

In 1965, the Division of Epidemiology and the Bureau of Laboratories of the Maryland State Health Department initiated a surveillance program for the arthropod-borne encephalitides. Personal visits were made to the pathologists and medical directors of most Maryland hospitals, and circulars were mailed which warned of the possibility of this disease's occurring and gave instructions as to the type of specimens to be shipped to the State Health Department Laboratory for diagnosis.

In previous years, surveys of the mosquito vector and birds had demonstrated the presence of Eastern encephalitis virus in Maryland, especially in the Eastern Shore swamp area.

Instructions for Collection of Specimens for Laboratory Examinations for Viral Encephalitis

FROM CLINICAL CASES

Collect 10ml blood during the early febrile phase of the illness. Split the 10 ml collection into two 5ml samples, putting each into an STS blood tube with rubber stopper and without preservative or anticoagulant.

Sample A.—One tube is used for virus isolation. Fresh blood is the best material from which to attempt this isolation. It should be frozen immediately after collection and shipped in a frozen state to the Central Laboratory, 16 E 23rd St, Baltimore, promptly after collection. If the specimen cannot be transported immediately, it should be stored in the freezing compartment of the refrigerator until it can be sent. This specimen must be labeled "Encephalitis virus studies" on the data slip.

Sample B.—The second sample is used for serology. It may be mailed to the Central Laboratory in the same manner as STS bloods are sent. Do not allow the clotted blood (sample B) to freeze. However, if the specimen is centrifuged and the serum taken off, this serum may be stored frozen. A second 10ml sample of blood should be drawn 14-21 days after onset and sent in for serology. It is necessary to have acute and convalescent specimens (paired sera) in order to determine a rise in antibodies. This specimen should be marked "Encephalitis serology" on the data slip.

FROM AUTOPSY MATERIALS FOR VIRUS ISOLATION

Whole blood or serum (10ml), if available; spinal fluid; stool, brain cortex, brain stem, or whole brain; lung, spleen, or other organs showing signs of involvement.

Autopsy specimens should be frozen fresh. Do not put them in formalin.

When there is autopsy material available for examination, notify Dr. John H. Janney, Division of Epidemiology, 837-9000, Ext. 8406, or Dr. J. M. Joseph, Central Laboratory, 837-9000, Ext. 8576. Instructions will be given as to shipment, or arrangements will be made for the material to be picked up by the Health Department.

Any inquiries regarding collection or handling of specimens should be referred to one of the above numbers.

Submit two stool specimens, taken on consecutive days, which will be used for attempts to isolate possible enteroviruses. These specimens can be mailed without refrigeration.

Case Report

This was the only documented case of mosquito-

From the Division of Epidemiology and Bureau of Laboratories, Maryland State Health Department.

borne encephalitis known to have occurred in Maryland in 1965.

On August 28, a 74-year-old Negro woman, resident of Stockton in Worcester County, was admitted to Peninsula General Hospital in a comatose state. The onset of her illness was three days before admission, when her family noted confused and strange behavior. One day before admission she was seen by her private physician, who had been treating her for adult-onset diabetes with oral hypoglycemic agents. At that time her oral temperature was 102°F. She was treated with parenteral penicillin, but the family returned the patient to the physician's office on the day of admission. She was in a coma and still febrile.

The following physical findings were recorded: P-120 BP: 220/110 R-30. Temperature: 104°F. The patient was an elderly Negro female in a comatose condition and showing no voluntary motion on the right side.

Neck: Nuchal rigidity was present.

Cardiovascular: The heart appeared enlarged with the apical impulse felt at the left anterior axillary line. A high-pitched systolic murmur was heard at the apex and was transmitted to the axilla.

Abdomen: No organs or masses were palpated.

Neurological: The patient exhibited a markedly depressed level of consciousness and would not respond to verbal commands. The deep tendon reflexes were generally decreased and a right hemiparesis was present with a positive Babinski sign on the right.

Laboratory Data: The initial WBC was 16,000 with 92 polymorphonuclear leukocytes, one stab form, and seven lymphocytes. Three days later, one day prior to death, the WBC was 5,000. The admission hematocrit was 37%. The cerebrospinal fluid was examined on the day of admission and had a xanthochromic appearance. There was a total of 768 cells/cu mm with 174 of these red cells and 594 white cells. The differential showed 60% of the white cells to be lymphocytes and 40% polymorphonuclear leukocytes. The CSF protein was 147 mg%, the glucose 183 mg% (with a simultaneous blood sugar of 340 mg%) and chlorides 125 mEq/1. A single hemagglutination-inhibition antibody titer to E.E. was 1:640.

On the day of admission, the BUN was 16 mg/100ml and the electrolyte determinations were within the normal range.

No bacterial pathogens were isolated from the CSF, and several blood cultures were negative. Eastern encephalitis virus was isolated from postmortem brain tissue.

X-ray: A chest film showed clear lung fields and minimal cardiac enlargement.

Clinical Course: The patient remained comatose throughout her hospital course. During hospitalization she received isoniazide, para-amino salicylic acid; penicillin, streptomycin, chloramphenicol, and insulin. Nevertheless, her condition deteriorated. Her pupils became fixed and small, and she failed to respond to pain throughout her illness. Her temperature had ranged from 103°F to 104.8°F until the final hospital day, when it dropped below 98°F. She died on the fifth hospital day.

Pathology: A widespread but mild encephalitis was present throughout the central nervous system, characterized by the inflammatory changes typical of arthropod-borne virus infection. Eastern encephalitis virus was isolated from her brain tissue.

Discussion: The isolation of the Eastern encephalitis virus from the patient's nervous tissue established the diagnosis postmortem. In addition, several horse cases of Eastern encephalitis were known to have occurred within 25 miles of her home. Studies of the usual vector, *Culiseta melanura,* in an area north of her home where a pheasant flock was almost destroyed by Eastern encephalitis, showed an infection rate of 1:167 from over 2,000 collected mosquitos. In addition, 57 isolations of Eastern encephalitis virus were made from mosquitoes collected from the Pocomoke cypress swamp, a few miles west of her home. This patient presented initially with a picture similar to that seen with a cerebrovascular accident. The diagnosis was subsequently proved to be arthropod-borne encephalitis.

Conclusion

The demonstrated presence of infected vector mosquitoes and reservoir birds, and known horse cases in previous years make the likelihood of cases of Eastern encephalitis occurring this summer probable. Alertness will aid in diagnosis of this disease.

301 West Preston St
Baltimore, Md 21201

when readings indicate hypertension

Time for Naturetin®

SQUIBB BENDROFLUMETHIAZIDE

to reduce blood pressure

In the management of your hypertensive patients, Naturetin is good therapy to start with, good therapy to stay with.

In mild hypertension, Naturetin lowers blood pressure gradually toward normotensive levels. In long-term therapy, Naturetin may keep blood pressure low—for months, sometimes years. When used in combination with other antihypertensive agents, blood pressure often falls further—and lower doses of both drugs are usually possible.

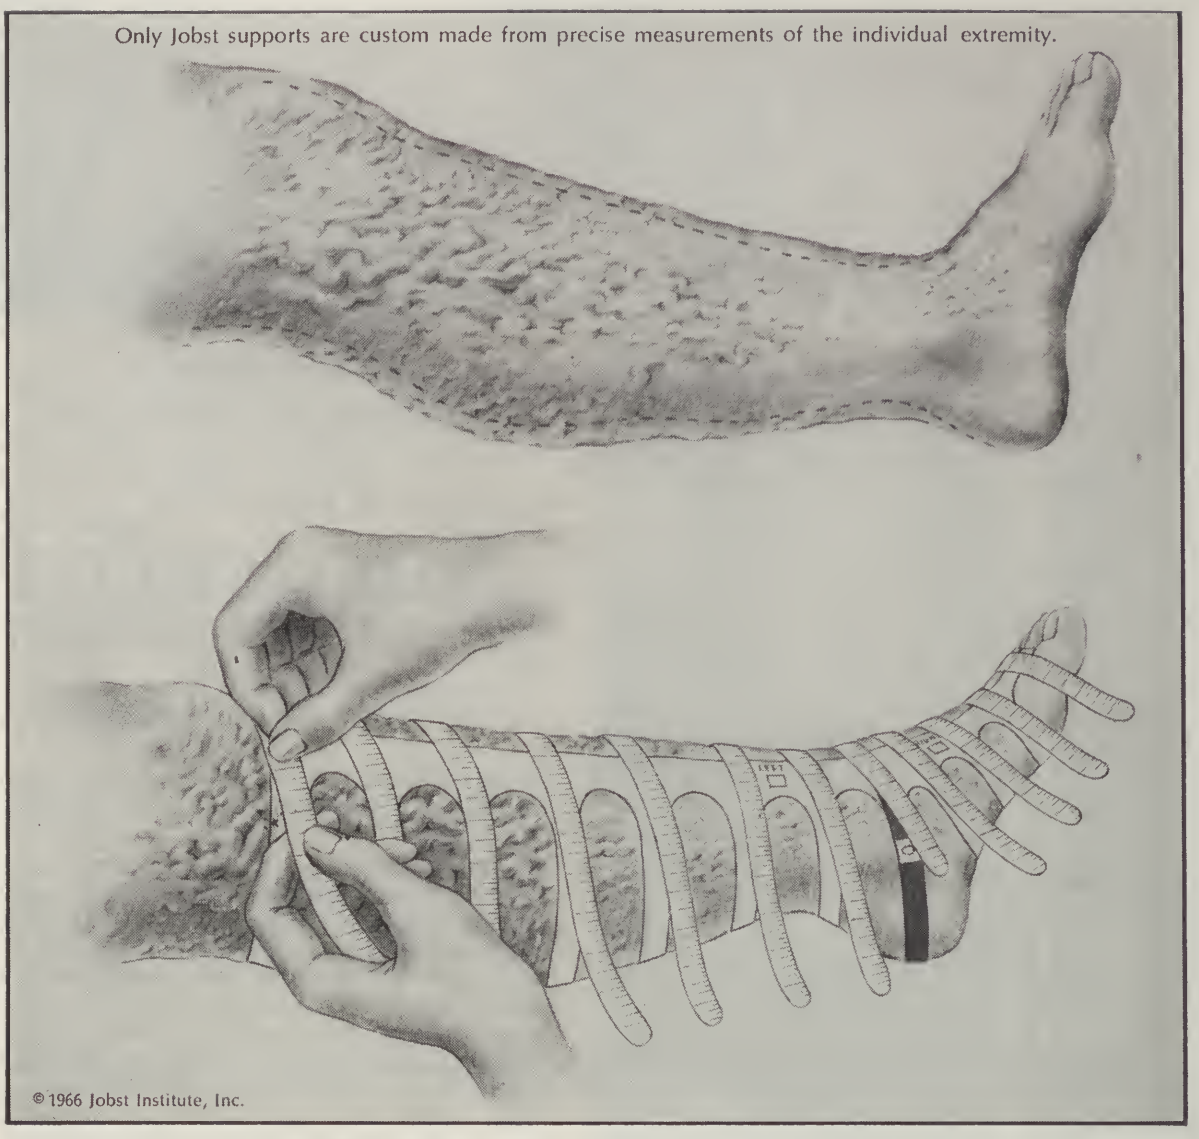
Clinical trials have proven Naturetin effective—without serious side effects.[1,2] And, when used to treat patients with cardiac edema and hypertension, "in no instance did the concentration of serum potassium fall below 3.1 mEq. per liter."[3] (Normal range for serum potassium: 3.5-5.0 mEq./liter).[4]

When readings indicate hypertension, start with Naturetin, stay with Naturetin.

Contraindications: Severe renal impairment; previous hypersensitivity.

Warning: Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting, or G.I. bleeding occur.

Precautions: The dosage of ganglionic blocking agents, veratrum, or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Electrolyte disturbances are possible in cirrhotic or digitalized patients.



Side Effects: Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, and rashes may occur.

Supplied: Naturetin (Squibb Bendroflumethiazide) 5 mg. and 2.5 mg. tablets. Also available—Naturetin c K [Squibb Bendroflumethiazide (5 or 2.5 mg.) with Potassium Chloride (500 mg.)]. For full information, see Product Brief.

SQUIBB Squibb Quality —the Priceless Ingredient

Only Jobst supports are custom made from precise measurements of the individual extremity.

© 1966 Jobst Institute, Inc.

Announcing the opening of a new Jobst Service Center

Suite 415, Medical Arts Building, 101 West Read St., Baltimore. Phone 539-0560

Jobst Venous Pressure Gradient Supports are custom made to precise measurements of your patient's extremity. Our service center is staffed with experts who will measure and fit your patient on your prescription only. Each support is individually engineered to exert the correct counter pressure according to your diagnosis and each support is guaranteed to fit, no strangulation, no puddling, no tourniqueting. Send patients to our Baltimore center for measuring and fitting; there is no charge for this service. For complete information have your secretary phone or drop us a card.

Medicine's Responsibility in Solving *Population Problems*

While the medical profession has successfully reduced death rates, it has tended to ignore the other half of the problem of natural balance—birth rates. If populations continue to increase, famines, poorer living standards, and growing tensions threaten our civilization and possibly the survival of the human race.

H. CURTIS WOOD, JR., MD
Medical Consultant to the Association for Voluntary Sterilization

Nearly everyone has heard of the population explosion. Why this term is used is not so widely known. It took well over one million years for the peoples of the earth to slowly increase until by the year 1800 AD the world population was about one billion. In only 100 years the increase was then as great as since man first appeared on earth, and by 1900 the population was approximately two billion. The third billion was added in only 60 years, and now, at present rates, in 35 years the world population will double and reach six billion; some experts predict it may be seven billion. How serious is this?

In 1961 a petition was sent to the heads of state of each member of the United Nations. It was signed by distinguished citizens from 19 countries, authors, educators, scientists, and political leaders, including 38 Nobel Prize winners. This petition urged the United Nations to take leadership in a program to limit population increases the world over, "in order that human beings everywhere may be assured of the opportunity to develop their highest capacities and to enjoy individual freedom, the advantages of education and public health, privacy, abundance, security and the beauty and wonder of the world." The petition went on to say that medically sound and individually acceptable birth control is an essential factor in any humane design to raise living standards and achieve international peace as well as social and family stability and that in spite of technological advances, the earth cannot provide food and minerals for a population increasing more than geometrically. "Unless a favorable balance of population and resources is achieved with a minimum of delay, there is in prospect a Dark Age of human misery, famine, undereducation, and unrest which could generate growing panic, exploding into wars fought to appropriate the dwindling means of survival."

More and more thinking people agree that the population problem is the basic problem of the world. Without widespread fertility control we cannot hope to maintain even today's living standards, nor can we raise them. The late President Kennedy realized that without population limitation the objectives of our foreign aid programs could not be achieved. In 1961, speaking of the situation in Latin America, in a special message on foreign aid, he said, "Population growth is already threatening to outpace economic growth,

I. Ridgeway Trimble Fund Lecture, presented at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 27, 1966.

and in some parts of the continent living standards are actually declining."

While the world population will probably double by the year 2000, Latin America's present 200 million will, at present rates, triple in these same 35 years and reach the staggering total of 600 million. Unless there is swift action to promote adequate fertility control, what hope is there for raising living standards and improving international relations and social or family stability?

James Reston, the newspaper columnist, echoed these thoughts when he wrote: "The greatest menace to world peace and increased standards of living is not atomic energy, but sexual energy," and Robert C. Cook, of the Population Reference Bureau agrees when he says: "The most ominous force in the world today is uncontrolled human fertility."

Whether one is primarily interested in world peace, fighting communism's spread, raising living standards, improving community or family life, or increasing the individual's opportunities for development and increased happiness and better health, these worthy goals can only be realized in conjunction with fertility control and responsible and voluntary parenthood.

Mankind's existence is threatened not only by atomic warfare. Famine on a tremendous scale involving hundreds of millions of people has been predicted for the 1970's by responsible scientists. This is in spite of the optimistic views of some that the earth can feed ten or more billions if we eat plankton three times a day—a rather dismal outlook! The Food and Agriculture Committee of the United Nations reported that merely to keep conditions from becoming worse, and some say 80% of the world's population are chronically hungry, the world food output would have to be doubled by 1980 and tripled by the year 2000. The same committee said recently that while food production has been markedly increased, populations had increased more rapidly so that every year successively for the last five years there has been less food for each person in the world than there had been the year before. This is another reason why the National Academy of Sciences warns us that "either the birth rate of the world must go down or the death rate must go back up." Which shall it be?

What about the United States? Obviously the world has a quantitative population problem of tremendous proportions. Do we also have one, or is ours more qualitative in nature? At present the problem in this country is more qualitative, but there is no cause for complacency as far as the quantitative aspects are concerned. Our population may also double by the year 2000 so that we might approach 400 million. This number might be accommodated if they were spread over the countryside. One difficulty is that today 75% of our people live in cities. This trend is not likely to be reversed, so our cities will become bigger and bigger, with more and more spilling out into suburbia. Three thousand acres a day of good topsoil are being bulldozed away to make room for shopping centers, housing developments, and highways. The statisticians tell us that we need two and a half acres of land for each person if we are to enjoy our present standard of living. We need this land to grow food, to raise cattle, sheep, pigs, chickens, and to grow timber for our economy. New York City alone, with a population of eight million, would then need 20 million acres of land to support it.

As our population grows and grows can we solve the problems of transportation, education, employment, recreation and maintain a way of life that will make living worthwhile? Why have we not yet outgrown the notion that a growing population and a booming birth rate is synonymous with a booming economy? More numbers do not assure high living standards. Look at India and China! And the businessman ought to realize it is the buying power of the individual and the family that keeps the economy healthy. We could probably be happier and more prosperous with a population stabilized at 200 million than with one at 400 million. In 150 years, the US may have three billion. So we do have a potential quantitative population problem, one which may become increasingly serious in the future.

Most of our present difficulties in this area stem from the fact that those least qualified for responsible parenthood are having the most children. Being "underprivileged" or "disadvantaged" or whatever one wishes to call it seems to encourage larger families than are found in the more "fortunate" segment of society. Statistics for New York can be used to illustrate. There are about 500,000 people in New York living on the

Welfare and under substandard conditions. They represent one-sixteenth of the population, yet they are producing one half of all the babies born in the city. They cost the tax payers about $500 million a year in direct relief handouts, and the services of 12,000 social workers are needed to distribute the checks.

The social costs are not measured in dollars and cents, but they are probably much higher than the tax bill. How many of the babies born in Welfare families are wanted? How many are loved? How many are rejected, neglected, and even abused? What about the 10,000 children a year who make up the "battered child syndrome"? What are the death rates, the disease incidence, the percentage of illegitimates, the number of alcoholics, drug addicts, the crime and juvenile delinquency rates in these "poverty pockets"? How many children, this half of New York's baby crop, will be able to fight their way out of the jungle and contribute to society and make useful and happy lives for themselves? Or will the Welfare become the only way of life they will ever know and continue to the third and fourth generation?

What of their mental health? Dr. Karl Menninger says: "Nothing is more tragic, more fateful, than the realization by a child that he is not wanted: From a purely scientific point of view, planned parenthood is essential in any program for increased mental health and for human peace and happiness." Other psychiatrists think that parental rejection in childhood will contribute to a deep resentment against society which may flare out into delinquency and crime.

Public Attitudes Toward Birth Control

Changes in attitudes regarding birth control have been taking place slowly for many years. Margaret Sangers no longer go to jail for trying to help the underprivileged to control their fertility. Progress has been rapid in the past few years, perhaps as a part of the sexual revolution of modern times. In 1960, 72% of Americans were in favor of making birth control available to anyone who wanted it. In 1964, the figure was 74%, and in the spring of 1965, a Gallup poll showed that 81%, or eight of every 10 people interviewed, favored free access to birth control.

There has been a tremendous increase in magazine articles and radio and television programs dealing with the many aspects of fertility control, from the population explosion to abortion and sterilization. Nearly all have been progressive and in favor of voluntary and responsible parenthood.

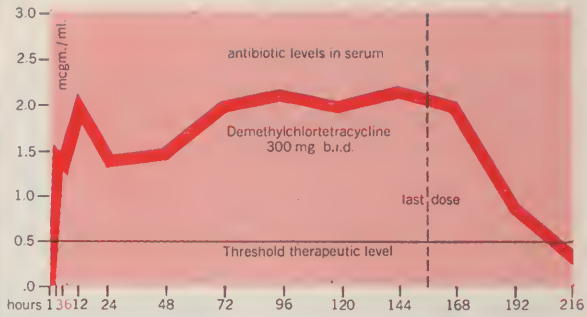
Today we can say that the people of the United States cannot be held responsible for the anachronistic attitudes and policies of many branches of our government when it comes to birth control nor for the ultraconservative attitudes of so many members of the medical and legal professions. The people want constructive action in this field.

Governmental Attitudes

In 1959, the Draper report recommended that the United States should help underdeveloped nations control their exploding populations, if asked to do so, as part of our foreign aid program. President Eisenhower emphatically rejected this suggestion, saying he could not think of anything less suitable for our government to undertake. I understand he has subsequently changed his mind.

President Kennedy felt that the United States should neither encourage nor oppose birth control in other countries but should be willing to consider any request for help.

Under President Johnson, our federal policies have progressed from the disapproval of Eisenhower, through the rather passive acceptance by Kennedy, to actual promotion. In several speeches, President Johnson has expressed his concern about the population problem and his desire to do something about it. The Children's Bureau, a unit of the Department of Health, Education and Welfare, has allotted $5,500,000 to support birth control clinics in certain cities where birth control advice and supplies are given. In 1964, Congress appropriated $25,000 to set up birth control clinics for the indigent in Washington, DC, and this year the sum has been increased to $200,000.



The Office of Economic Opportunity, under Sargeant Shriver, has approved all methods of fertility control for the indigent except the surgical method of voluntary sterilization, as part of the war against poverty. Since the most effective single weapon in this war against poverty is fertility control, it is unfortunate and regrettable that Mr. Shriver excluded one of the most effective methods of family planning; 100,000 more

broad-spectrum performance above and beyond the activity of ordinary tetracyclines

DECLOMYCIN®

DEMETHYLCHLORTETRACYCLINE

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

privileged Americans choose this method every year. Methods and techniques should be left to be decided between the patient and the doctor concerned and should not be dictated by the head of OEO.

Medical Attitudes

Has the medical profession kept up with the progress made by the people and the government? Unfortunately, no! There has been some progress, however. A former president of the American Academy of General Practice, who had also been the president of a State Medical Society, said, not many years ago: "Physicians are in practice for only one reason: to treat sick people." Such dedication to one line of endeavor tends to remove the doctor from the world and its woes. Are we medical men not concerned with such things as the possible annihilation of mankind or the destruction of our civilization? Should we remain aloof to the problems that will confront us as the recipients of the Welfare continue to outbreed those who support them? As we go about healing the sick, or adding to the population, might we not worry at times about the type of life our children and grandchildren will have? Our communities may be sick with delinquency, crime, poverty, unemployment, substandard education, discrimination in various forms, and political corruption. Are not these plagues as worthy of our attention as the old ones of typhoid, smallpox, diphtheria, or polio? They may be more so since diseases merely kill individuals, while the new plagues may destroy our ideals and way of life.

Albert Einstein has placed the blame for many of the most serious problems facing mankind squarely in the lap of the medical profession. He said: "Progress in hygiene and medicine has completely altered the previous precarious equilibrium of the quantitative stability of the human race. I am, therefore, firmly convinced that a powerful attempt to solve this tremendous problem is of urgent necessity." We of the medical profession have been so successful in lowering death rates while ignoring the other half of the balance that we have hopelessly upset the natural equilibrium. Only we can restore the needed balance, yet even now we spend 500 times as much on research into better methods of death control than we do in better methods of birth control.

After years of silence and avoiding the issue, the AMA in December, 1964, issued a statement of policy regarding birth control, or family planning. They said that family planning was not only part of responsible parenthood but was also part of responsible medical practice. Doctors are obligated to supply birth control services to patients who wish it or, if the doctor does not care to do so, he should refer the patient to some suitable person or agency. He ought not to impose his own views or disapproval on the patient, as has so often been done individually and collectively. The AMA policy goes on to say that birth control should be made available to all who need it, "whether they obtain their medical care through private physicians or tax or community supported health services."

This recent statement of policy, along with the lifting of legal and governmental restrictions, should be all that is needed for doctors, hospitals, and public health and welfare departments all over the United States to really forge ahead toward the goal of having every baby come into the world because it is wanted and when it is wanted by its parents.

North Carolina has gone far along this road. Every county offers the indigent family planning advice and supplies. Tax funds are used to pay hospitals at the rate of $20 a day for women welfare recipients who elect to terminate their fertility by sterilization in *all* counties. In four counties, tax funds are also used through the Welfare Department to pay the operating surgeons $50 for the procedure. Two counties in Virginia and two in Michigan have similar arrangements: yet, in many parts of the country, citizens, doctors, and lawyers mistakenly believe such things cannot be done.

The time has come, as Dr. John Rock says in his book, not only for Catholic and non-Catholic to work together for voluntary and responsible parenthood, with suitable compromises as to methods to be used, but for the medical profession to recognize the seriousness of the population problems at home and abroad and to take its rightful place as leaders in this great and urgent effort. What good will a cancer cure and men on the moon do if the world succumbs to overpopulation?

7010 Lafayette Ave
Fort Washington, Pa

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

FAMILIES AND PHYSICIANS

The story of a half-century of medical progress in a typical American community—Damascus, USA, is a tribute to a distinguished physician whose devotion to and care of the sick remain a warm memory in the minds of many families.

JOHN PARKS, MD
The George Washington University School of Medicine

It is indeed an honor to present this lecture in memory of Dr. George M. Boyer, a distinguished alumnus of The George Washington University School of Medicine and a physician whose devotion to the care of the sick remains a lasting memory in the minds of colleagues, families, and friends of Damascus and Maryland.

After careful planning, a hospital was built in Damascus. It contained pavilions for men and women. "There were separate wards for internal medicine, surgery, orthopedics, and eye diseases. A large pharmacy well stocked with drugs was attached to the hospital. Patients who did not need hospitalization were given prescriptions that they had filled at the pharmacy. In a spacious hall was a library containing most of the available medical manuscripts." The physician in charge made the rounds of the patients, found out their condition, and considered their affairs. He had "with him assistants and orderlies, and all that he wrote down in the way of orders for each patient regarding medication and care was carried out carefully. After finishing his rounds he used to go up to the citadel and treat whoever was sick among the nobility and the government officials. Then he would come back to the hospital . . . to teach the students and discuss the medical topics and difficult cases with the physicians."[1] This was the Nuri Hospital of Damascus, Syria, around the twelfth century. It served as a model for other hospitals of the period in Syria and Egypt. Specialization prevailed.

George M. Boyer, MD, Fund Lecture, presented at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 27, 1966.

As early as the fifth century, BC, Herodotus wrote: "Each physician applies himself to one disease only, and not more. All places abound in physicians; some physicians are for the eyes, others for the head, others for the teeth, others for the intestines, and others for internal disorders."[2]

"There is no new thing under the sun."[3]

In our country, early in the nineteenth century, there was a small cluster of houses located on what land grant records of the State of Maryland described as the "Pleasant Plains of Damascus"; and there five generations of the Boyer family have lived.

After an early academic career that included graduation from Shenandoah College, four years as a teacher, and then a medical degree from The George Washington University School of Medicine in 1902, Dr. George M. Boyer returned to Damascus, where he served as family physician in this Maryland community for more than a half century, until his death in 1956, at age 84.

Doctor Boyer was a highly respected, warmly appreciated physician. He loved people and was tireless in his efforts to help them. During his 50 years in practice, he made his rounds on horseback, motorcycle, and automobile; he delivered more than 3,000 babies, almost all of them at home, usually with the aid of a practical or trained nurse. He saw 90% of his patients in their homes and only about 10% in his office. Similar to many physicians of his time, he never bothered about bills. Medicine, like the ministry, was a calling, and finances seemed the least important part of it.

When World War I broke out, Dr. Boyer was 45 and had four children, but he enlisted and soon rose to the rank of major. After the war Dr. Boyer rushed home to help fight a serious epidemic of influenza that had brought death to neighboring physicians and townspeople.

In Dr. Boyer's day, rural and small town homes consisted of relatively large houses containing big families. A visit to see one ailing member usually resulted in at least a verbal summarization of the health of the whole family. The family doctor dispensed more than pills, powders, and poultices. He carried with him a reassuring pharmaceutical aroma that became evident before he reached for the pulse, felt the forehead, or opened his well-stocked black bag. His quiet identification was as impressive as his verbal communications.[4] He often served as family confessor and adviser, taking the total life of his patients in daily stride.

Doctor Boyer read diligently from medical journals, attended medical meetings, and served as president of the Montgomery County Medical Society. He kept current with the scientific advances of his day and attended his patients with a compassion that was truly inspiring. This image of the family physician should never pass into medical oblivion. These wonderful qualities of empathy, understanding, and compassion, that we have long called the art of medicine, still have their important part to play in the practice of medicine. They can be provided for patients equally as well by specialists as by generalists. The science and techniques of medicine never need be cold. They can be delivered with warmth.

I am reminded of an anesthetist on our staff, a highly skilled individual, who was treating a patient with agonizing nerve root pain caused by cancer. After warm and friendly greetings and while making proper preparations for an intrathecal injection, he began to hum an aria from a favorite opera. By the time he had completed the injection procedure, his patient had joined in the chorus, and she left the operating room in a relieved mood quite in contrast to her entry.

Let us now turn our attention to Dr. M. McKendree Boyer, past president of this distinguished Faculty,[5] for a modern profile of practice in Damascus, USA: an example of American medicine at its best.

Like his father, Dr. McKendree Boyer received his medical degree from The George Washington University. He continued his education with an internship followed by residency training in internal medicine at the St. Luke's Hospital in Cleveland and by postgraduate work in London and Vienna. He returned to Damascus to work with his father.

Three decades have changed Damascus. It is no longer rural. Little farming is done in the area. Damascus has become a community made up almost entirely of commuters. Doctor McKendree Boyer's practice is conducted in a well-equipped medical building designed to blend into the neighborhood. The present Boyer Medical Building is like a small hospital with offices for three physicians and a complete set-up for a dentist. A laboratory, diagnostic x-ray and cardiographic

equipment, nurses' station, and waiting rooms for children and adults complete the facility. Many more patients can be seen and more efficient care can be given in this office—open days and evenings—than was possible a generation ago when home calls were a major part of practice. Dr. Boyer has continued his specialty of internal medicine and believes that an associated group practice is the best way to provide families with the medical care they need. Let us consider this thought in terms of our present and future responsibilities as physicians.

Americans of the past half century have been on the move. In a population of almost 92 million in 1910, 18.4% moved each year; whereas, in 1964, 19.6% of 194 million people changed residence at least once during a single year.[6] Young people in their reproductive, working years move to the suburbs, while older people tend to move to cities from outlying areas. In some city areas today more than half of these older people live alone.[7] For a large part of the populace, apartment-dwelling has replaced home environments that were surrounded with yards and trees. Thus, as physicians, we have a responsibility to a constantly changing, ever increasing group of patients, the majority of whom report only for episodic care.

In turn, families moving to new communities have difficulty finding medical security among the widely diversified and physically separated specialists. Sympathetic specialists are frequently called upon to serve as family advisers and physicians far from their field of medicine. It is not at all unusual for a family to have a list of half a dozen or more doctors to call for individual illnesses. Selection of the right specialist depends first upon self-diagnosis. In this regard, the mothers of our country practice the medicine. They make preliminary diagnoses and decisions, call the doctor, and carry out the bedside treatment. They give birth to the children, nourish and protect them through a period of dependency, and guide them through adolescence to marriage, parenthood, and a new family that is usually established apart from the parent home, frequently at a great distance from the original environment.

How much easier it would be for families to have reliable medical clinics or centers to which they could report for complete medical care, and how much more effective physicians are when they combine their professional resources. Shared office overhead also increases the individual earnings of doctors.

Patients have become accustomed to going to the doctor, but they want these diagnostic and therapeutic services near their homes. In communities where there are hospitals, physicians are finding it increasingly convenient to establish offices nearby. Traveling from home to office to hospital and from hospital to hospital has become as time consuming for the specialist as home calls were for the practitioners. The doctor's time has become too valuable to spend it in traffic during the most productive part of his day.

The physician must make effective use of his office hours. Many more people are demanding his services. In 1930, 44% of all patient visits were in the home; in 1960, only one visit in 10 was in the home. In 1931, the average number of patient visits per physician per week was 50; today the number is twice that many.[8] In order to meet the increasing needs of his patients most effectively, the physician must develop and use ancillary medical personnel and new methods in his office, just as in the hospital. Laboratory data and patient records should be transferred readily and completely from office to hospital and back from hospital to office so that continuity of care is maintained and costly reduplication of services is avoided. As captain of the health team, a significant part of the physician's success depends upon his ability to coordinate his services with those of his co-workers. Where patients can come to a central source for their health needs—a single stop service—whether it be a small group practice clinic, a community office-hospital facility, or a large, specialized city medical center, services in these settings can be provided more effectively and efficiently than in widely separated specialty offices.

Hospitals

Hospital resources in our country have increased more rapidly than the population. Community and Hill-Burton funds have brought hospital facilities to hamlets, towns, and suburban developments throughout the land. Doctor Luther Terry has reported that in the past 30 years there has been an increase from 3.7 to 4.6 general hospital beds per 1,000 population. But during this same period of time, hospital admission rates have increased from 56 to 132 per thousand

people per year, and the average hospital stay has gone up 47%.[9]

Overcrowding and understaffing of hospitals is a prevalent problem throughout the country. Hospitals have become so accepted and convenient for the care of all medical problems that lack of a hospital bed has become a hazard for the acutely ill individual, as well as a time-consuming concern of the patient's physician. At the hospital, the physician orders services while he is neither producer nor consumer. He is only privileged to work there, provided space and time are available for him to carry out his services for those patients who can be admitted to the hospital.

As Ray Brown has stated, "Scientific medicine changed the hospital's purpose from one of congregating patients to one of congregating resources. By the same token, it changed the hospital's responsibility from a limited one of congregated care to an unlimited one of comprehensive care."[10] Nowhere is this more true than in the emergency units of modern hospitals. Emergency facilities have become more than accident wards. They now serve as important community health centers. After dark, on weekends, and during holidays, an increasing percentage of the population turns to the nearest hospital for relief of bodily discomfort or mental anguish. Emergency facilities are crowded with a cross section of the citizenry seeking medical or surgical aid for assorted ills. No appointment is needed. Physicians and nurses are always on duty, and regardless of the patient's illness, the emergency room physician must first serve as a diagnostician and then possibly as a specialist.[11]

In terms of time, patients 25 miles from the nearest physician or hospital are closer today than were our ancestors living three miles from the doctor.[12] But with crowded highways and congested city traffic, recent experience has shown that helicopter ambulance service to a hospital is a quicker life-saving procedure, in many instances, than other forms of emergency transportation.[13]

Community hospitals were never intended to provide all the specialty procedures that can be accomplished in university medical centers. They should serve as satellites of the large medical centers. Patients are happier when they can be near their home and depend on their physician to tell them when their problems are too complicated for the community hospital.

It has been determined that in an average month, out of an adult population of 1,000, 750 will experience an episode of illness, 250 of these will consult a physician, nine will be hospitalized, five will be referred to another physician, and only one will be referred to a university medical center.[14]

These few special, referred patients who can pay for care receive excellent treatment at university centers. Semi-indigent patients, who make up the major rolls of teaching hospital outpatient departments, receive attention in increasing proportion to the complexities of their problems. Theirs is the long registration line, the hard bench, the meticulous and detailed history, the waiting period for a staff checkover, and the short period of therapeutic instruction. Outpatient departments, rather than serving as office examples for the house staff, frequently represent patient selection areas for hospitalization of interesting pathologic conditions. The patient's total needs may be lost in the finding of an unusual heart murmur that deserves special studies.

In this setting, Knowles has stated, "A two-class system of care has prevailed whether it be the contrast between inpatient and outpatient or private versus clinic patient."[15] Is this the best care university centers can provide separate segments of society, and is this the best teaching that can be accomplished with ambulatory patients? This system of clinical instruction is deeply ingrained, but it can and should be improved. For example, appointment times could reduce waiting time. We need to reevaluate clinic and home care in terms of the total population and with regard to the responsibilities of our future physicians.

Medical Education

The basic science faculties, fully engrossed in useful investigative activities, no longer need to teach dull, empiric principles; they have a vital new molecular biology that is based upon valid experimental findings. Basic science teaching and research have a profound meaning for every patient as well as for all students of science.

Possibly medical educators have been working with a clinical population sample that is too highly selected. Clinical faculties in medical schools

have become highly departmentalized and specialized; they provide their students and health staff with excellent scientific experience in horizontal, episodic, and unusual medicine. Exposure to a super-selected sampling of illness alone provides an unrealistic concept of comprehensive medical responsibilities. Several schools of medicine have started, and others are sure to follow, with programs of comprehensive medical care. Some of these programs of vertical medical education introduce the student to the total health needs of individuals in the community by preceptor experience with practicing physicians. At other schools, attempts at teaching vertical clinical medicine have been made through comprehensive care clinics. At our school, experiments in comprehensive care have been practiced for more than 10 years, but much more intensive evaluation of the science of health service as it relates to undergraduate and postgraduate medical education is long overdue in all clinical centers.

Working in complete cooperation with community hospitals, professional staffs, and medical societies, university programs in medical education must extend well beyond the campus to serve as a ready resource for the exchange and advancement of useful thoughts. As Fox recently said, "In human evolution we have reached a point where further progress can come only from thinking. And thoughts can come only from minds—the minds of individuals."[16]

It seems to be a common misconception of graduates of medicine that the professor thinks he has all the right answers. The professor who is a true teacher takes more pride in the independent thoughts of his students than in his own authority. Medical educators and medical practitioners must come closer together. There is no room for delusions of accuracy. In our individual professional responsibilities everyone must be accurate, ethical, effective, and progressive. Practices must keep current with the preciseness of science. The practicing physician is a translator and transmitter of scientific progress from the laboratory bench to the patient's bedside.

All of us gathered here today know about and have benefited from the phenomenal advances of medical science of the past half century. Sanitation, vaccination, immunization, chemotherapeutic and antimicrobial agents have changed man's way of life. In turn, these advances have produced a profound disruption of the biological balances of nature.[17] We must assume full responsibility for the drugs, appliances, and surgical procedures we use. Drug dangers must be balanced against drug benefits. No drug or fluid or operation is totally innocuous.

In addition to learning how to use intelligently and benefically a constant myriad of new drugs and instruments, physicians must apply their interests and talents beyond the individual desires of patients to the necessities of world population control. Medicine must help prevent new life in order to have time and resources to care for those about to be born or who are already living. Population increases disproportionate to deaths are rapidly crowding a world in which modern travel and communication have made us all global neighbors. No disease is so remote that it cannot be transferred to any part of the earth in less than a day. In this setting, it is essential that each of us maintains a responsibility for the world of medicine in which we live.

Technology has become a part of medicine too, but automation cannot assume responsibility. Computers are rapidly assuming medical status, but patients will always be grateful to have a human at the controls. We can make a plastic filler for the brain or breast, a glass jaw, a pliofilm aorta, or an artificial limb. These are superficial, artificial, and beneficial patient parts, but when attached they are something of the patient—a troubled human who needs additional help. We cannot manufacture the mind or substitute the spirit of life.

"Today, when so many progressive minds are preoccupied with ways of doing things," Fox has said, "we too easily forget what ends these means are meant to serve. If doctors were scientists they might, like scientists, disclaim responsibility for the uses to which their knowledge is put. But medicine is not itself a science; it is a form of service which is as much concerned with ends as it is with means. The doctor has to make sure that what he learns is used to help rather than to hurt."[18] The teacher of medicine —and all doctors are teachers—must apply this service measure of medicine to his daily work.

Society and the Profession

Ralph Waldo Emerson has said, "The first wealth is health." Health is an individual's greatest possession and a nation's greatest strength.

The rich cannot buy health; the poor have not been able to afford it. Health, like education and natural resources, is a shared asset of an advancing civilization. In our country, care of the indigent has been a thing apart from private practice, but soon medical indigency will be a thing of the past.

The American public has gone on record by clearly expressing, through the 89th Congress, that health care is as fundamental to human life as is education. More than a dozen health-related bills were passed by the 89th Congress, and implementation of these public laws is well under way. Through an elaborate partnership between Social Security and private third party insurance agencies, the elderly, the handicapped, and needy individuals under 21 years of age will be eligible for health insurance benefits never before available to them. Within less than a decade it is anticipated that every American citizen will have the privilege of selecting his own private physician or clinic.

Society has singled out the older people for a reason. They have more illnesses and fewer fluid resources; they are increasing rapidly in number; they have limited opportunity for gainful or purposeful employment, and they present unmeasurable problems in social and psychiatric as well as physical and rehabilitative care. Society must meet the problem of aging with more than money and medicines, hospitals and nursing homes. Methods of keeping these older individuals usefully integrated into the mainstream of life, in homes of their own that are suited to their limited physical reserves will preserve self-esteem. Loss of self-esteem is the first step to mental disability. Physicians are going to have responsibility for an increasing number of people 65 or older, of whom 80% have a chronic ailment; 28% have arthritis or rheumatism, 17% have hearing impairment, and 10% cannot see as well as they should.[19]

Only half the nation's population, estimated to reach 235 million by 1975, will be between the ages of 21 and 65. The very young and the aged are the two groups requiring the most in medical services.[20] They are the ones to whom preventive and health preservative measures are highly important.

I can speak with some experience about the benefits of periodic health examinations for elderly women. Since the cervix, uterus, ovaries, and tubes are in the hidden recesses of the body cavity, women are handicapped. They have no way of seeing their reproductive structures. They depend entirely upon their physician for early diagnosis of internal genital disease. Periodic health examinations, including careful pelvic examination, cytologic smears, endometrial aspiration, and indicated biopsies, are our only current means of finding early genital cancer in women in the curative stages of the disease. The incidence of all types of genital cancer increases after the age of 50.

Some physicians allocate a half day or more of their office time to these periodic health examinations of well women. Such an office morning can be one in which there is no rush resulting from a backlog of waiting, sick patients. Many healthy women hesitate to go to the busy doctor when they know that there are other patients with real illnesses who need immediate attention. They are apologetic about taking up the doctor's time, and, if by word or by action the physician or nurse makes the patient feel like an unwelcome neurotic, she will not return. But these well-educated, older women are only a small segment of the population. Aware of the importance of their health, they are capable of finding their way in our medical world.

Others are not so intelligent or so adequately financed. From years of municipal hospital experience, I know, too, about the complications of the unregistered expectant mother, the frightened patient who harbors a tremendous genital tumor until is is more than apparent, and the superinfected person who reports to the emergency room next to death's door. These represent gynecologic samples of an inadequately treated populace. They present a challenge to medical science, but more importantly they represent an educational and therapeutic responsibility that must be shared by society, by medicine, and by science.

Social inertia and emotional immaturity are part of the culture of every nation, and in these areas all countries show varying degrees of underdevelopment. Poverty, illness, and illiteracy form a fomenting triad in which one part adds to the other. American medicine's biggest challenge and greatest opportunity of the next decade is its open invitation to join social and economic forces to combat diseases and disabilities of the economically, socially, and physically handicapped members of our society while maintaining

the health and stability of those who make up the productive working manpower and the protective military forces of our nation.

The larger and more compact the urban area, the greater seems to be the need for non-patient financed medical care. For example, in New York City, it is estimated that one-half the hospital bills and one-third of the entire medical care costs of illness are currently being borne by governmental programs.[21]

Governmental medicine is not new. Only the method of sharing costs and producing a wider distribution of better services is new. Every physician in this room has given freely of his time and talents to care for the indigent ill. The ward patient usually was a responsive individual, and it gave us a good feeling to give of our services without thought of remuneration. The teacher always gains as he gives. We explained the difference in health statistics between the ward and private patients on such factors as race, economic status, social habits, or the inexperience of the house staff. This latter implication always bothered me. I have always thought house staff doctors about the best ones to have when you are really sick.

Perhaps the threat of having no free patients strikes at our sincerely altruistic medical consciences. Being paid for the care rendered to every patient is a new concept for many of us. In our country we think of life as priceless, and it is well within the capabilities of physicians to preserve life. But it is still difficult for doctors to place a cost value on services. Is a surgeon's high fee as justifiable as a low fee for an equally life-preserving injection of adrenalin? Economic accounting cannot be settled on life alone. As a profession we have shown variable abilities to place a proper price on our services even for those capable of paying. This has led the public, business organizations, trade unions, and government to demand of medicine such economic procedures as prepaid health programs, insurance limitations, and relative value scales.

As physicians we are experiencing an increasing participation of lay people in medical affairs. Medicine, like the military, has become too important to be left to the professionals, and, too, health care has become big business. Approximately 6% of our 600 billion gross national product is spent on health. Ours is a commercial culture, as advanced in the art of production, trade, communication, and profit as has ever been developed in the history of man; and almost everything that influences individual actions seems to have a dollar value.

To meet new dimensions of medical care, physicians, medical schools, hospitals, all members of the health professions, and community leaders need to consider carefully past procedures and present practices with a view of developing ways and means of providing comprehensive medical services for all the people. Barriers and biases have no place in medicine. In the fellowship of healing, any human being anywhere in need of medical care deserves a helping hand, a thinking mind, and the best there is available to meet the health requirements of the individual and his family.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W. B. Saunders Company, 1959, p. 395.

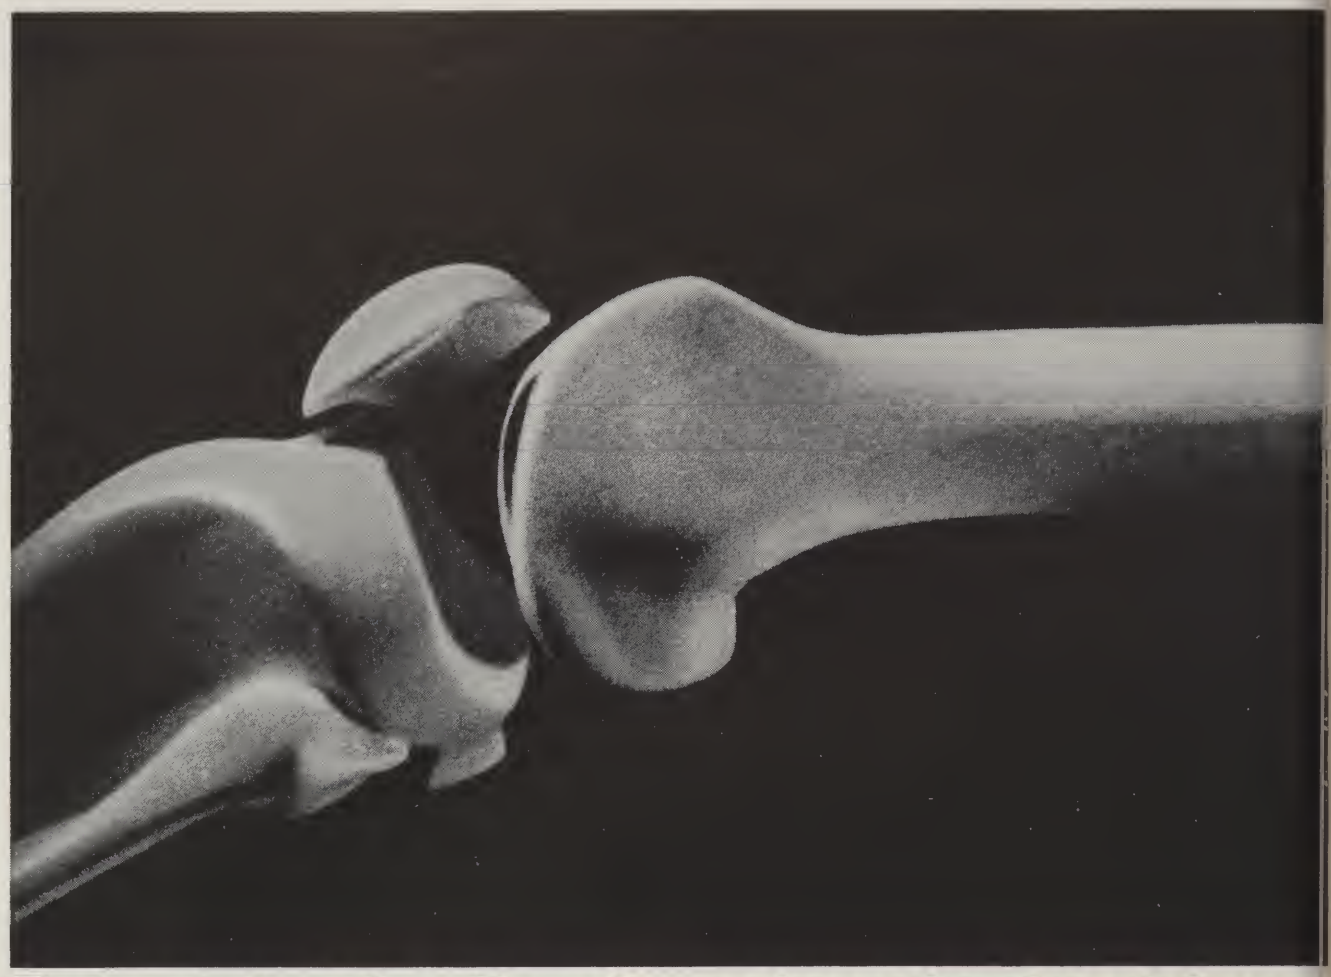
BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.

Indications: Essential hypertension.

Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.

Contraindications: Salutensin is contraindicated in severe depression.

Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).



Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)

Usual Dose: 1 tablet *b.i.d.*

BRISTOL
BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

Butazolidin® alka

phenylbutazone	100 mg.
dried aluminum hydroxide gel	100 mg.
magnesium trisilicate	150 mg.
homatropine methylbromide	1.25 mg.

Usually works within 3 to 4 days in osteoarthritis

The trial period need not exceed 1 week. In contrast, the recommended trial period for indomethacin is *at least 1 month.*

That's why it's logical to start therapy with Butazolidin alka—you'll know quickly whether or not it works. And usually, it will.

A large number of investigators have reported major improvement in about 75% of cases. Some patients have gone into remission. Relief of stiffness and pain may be followed quickly by improved function and resolution of other signs of inflammation. And Butazolidin alka is well tolerated, especially since it contains antacids and an antispasmodic to minimize gastric upset.

Contraindications
Edema, danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. The drug should not be given when the patient is senile, or when other potent drugs are given concurrently. Large doses are contraindicated in patients with glaucoma.

Precautions
Obtain a detailed history and a complete physical and laboratory examination, including a blood count. The patient should be closely supervised and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Make regular blood counts. Use greater care in the elderly.

Warning
If coumarin-type anticoagulants are given simultaneously, watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Carefully observe patients receiving such therapy.

Adverse Reactions
The most common are nausea, edema and drug rash. Hemodilution may cause moderate fall in red cell count. The drug may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, generalized allergic reaction, stomatitis, salivary gland enlargement, vertigo and languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia may occur. Confusional states, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hepatitis, jaundice, and several cases of anuria a hematuria. With long-term use, reversib thyroid hyperplasia may occur infreque

Dosage
The initial daily dosage in adults is 300-4 mg. daily in divided doses. In most instances, 400 mg. daily is sufficient. Whe improvement occurs, dosage should be creased to the minimum effective level: s should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. da

Also available: Butazolidin®,
brand of phenylbutazone
Tablets of 100 mg.

BUSINESS SESSIONS

SPECIAL MEETING
January 29, 1966

MINUTES

The 252nd meeting, Special Session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 2:05 P.M. Saturday, January 29, 1966, at the Faculty Building, 1211 Cathedral Street, Baltimore, Maryland, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance. An asterisk indicates an alternate delegate.

Doctors: John G. Ball, Montgomery County; Edward M. Barczak, Baltimore City; Richard D. Bauer, Council; Harry McB. Beck, Baltimore City; Donald W. Benson, Baltimore City; M. McKendree Boyer, Past-President; Robert vL. Campbell, President; Douglas G. Carroll, Baltimore City; Robert G. Chambers, Baltimore City; *Katharine A. Chapman, Montgomery County; Henry V. Chase, Council; Archie R. Cohen, Washington County; H. Douglas Cooper, Wicomico County; Ernest I. Cornbrooks, Baltimore City; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore City; *Robert Dawson, Allegany County; John B. DeHoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; J. Sheldon Eastland, Past-President; William C. Ebeling, Council; Emanuel S. Ellison, Baltimore City; *Max R. English, Baltimore City; James McC. Finney, Harford County; Whitmer B. Firor, Past-President; Russell S. Fisher, Council; *Harold H. Gist, Washington County; Albert E. Goldstein, Past-President; *Paul F. Guerin, Baltimore City; William B. Hagan, Council; Thurston Harrison, Council; John C. Harvey, Baltimore City; John S. Haught, Prince George's County; William G. Helfrich, Baltimore City; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; James P. Jarboe, St. Mary's County; James R. Karns, Baltimore City; *Arthur T. Keefe, Kent County; Lauriston L. Keown, Baltimore City; Robert C. Kimberly, Council; Howard F. Kinnamon, Past-President; Louis Krause, Council; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; Norman Levin, Baltimore City; *Eugene J. Linberg, Baltimore City; F. Ford Loker, Baltimore City; William J. McClafferty, Baltimore City; George S. Malouf, Prince George's County; Karl F. Mech, Council; Philip W. Mercer, Carroll County; B. Martin Middleton, Council; John E. Miller, Baltimore City; Donald Mintzer, Baltimore City; Andrew C. Mitchell, Wicomico County; Frank K. Morris, Board of Medical Examiners; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Past-President; William A. Pillsbury, Council; *Samuel R. Pines, Baltimore City; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas Reid, Frederick County; Paul F. Richardson, Jr., Council; *John O. Robben, Montgomery County; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Salvador Rossello, Baltimore City; Edwin Ruzicka, Talbot County; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; *George W. Settle, Anne Arundel County; Thaddeus C. Siwinski, Baltimore County; R. Kennedy Skipton, Prince George's County; John N. Snyder, Baltimore County; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; Aaron H. Traum, Montgomery County; Thomas E. VanMetre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson Walden, Baltimore City; Hugh W. Ward, Calvert County; J. Arthur Weinberg, Council; *Ralph H. Williams, Washington County; Eldridge H. Wolff, Dorchester County; Donald O. Wood, Baltimore County; *Arthur F. Woodward, Montgomery County; *Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; Raymond M. Yow, Council.

Staff personnel were also present for the meeting.

The President made certain announcements with regard to the conduct of business at the session.

PRESS EXCLUDED

On motion of Dr. Settle, the press was excluded from the session.

RESOLUTION ADOPTED

Dr. Settle, chairman of the Professional Fee Fund Committee, reported on its behalf and offered the following resolution which, after debate and amendment, was adopted as follows:

Resolved, That a Committee consisting of sixteen members be established under the Bylaws consisting of a chairman and a representative from each of the following organized specialty groups in the State:

Maryland Society of Internal Medicine
Maryland Radiological Society
Maryland Chapter, American Academy of General Practice
Maryland Orthopedic Society
Maryland Pediatric Society
Maryland Ear, Nose and Throat Society
Maryland Society of Pathologists
Maryland Thoracic Surgical Society
Obstetrical and Gynecological Society of Maryland
Maryland Ophthalmological Society
Maryland Society of Anesthesiologists
Maryland Chapter, Industrial Medical Association
Maryland Chapter, American College of Surgeons (General Surgery)
Maryland Psychiatric Society and
Maryland Dermatological Society

Resolved, That the Committee thus established be appointed immediately and have as its purpose rendering assistance to those who have requested it in clarifying specific contractual arrangements which they have, rendering assistance to those who request it in negotiating ethical contracts and that appropriate changes in the Bylaws be made to effect this.

RECESS TAKEN

Dr. O'Donnell, on behalf of the Bylaws Committee, moved the adoption of amendments to the Bylaws in accordance with the notice which had been sent as provided in the Bylaws by amending Article X by inserting

a new Section 20 and by amending Article XIII by substituting for it a new Article XIII. Dr. O'Donnell then offered substitutes for these amendments. The meeting thereupon, by unanimous consent, recessed for ten minutes.

BYLAW AMENDMENTS

Upon the expiration of the recess, the proposed substitutes for the Bylaw amendments were considered seriatim and, after debate and amendment, the proposed substitutes for the Bylaw amendments were divided to be voted on separately, and the Bylaw amendments, as thus amended, were then adopted on division votes by more than the required two-thirds. The Washington County delegates asked that the minutes reflect that it voted against the amendments as instructed by its Society.

To amend Article X by inserting after Section 19 the following Section 20 (all succeeding Sections being automatically renumbered):

Section 20. As soon as practicable after the annual session each year a Committee on Contractual Arrangements shall be appointed whose purposes it shall be (a) to render assistance to those members who request it in clarifying the ethical standards applicable to specific contractual arrangements they have, and (b) to assist those members who request support in negotiating ethical contracts. The committee shall be appointed by the Faculty's President and be composed of a chairman and one member selected from and nominated by each of the following specialty groups: Maryland Society of Internal Medicine; Maryland Radiological Society; Maryland Chapter, American Academy of General Practice; Maryland Orthopedic Society; Maryland Pediatric Society; Maryland Ear, Nose and Throat Society; Maryland Society of Pathologists; Maryland Thoracic Surgical Society; Obstetrical and Gynecological Society of Maryland; Maryland Ophthalmological Society; Maryland Society of Anesthesiologists; Maryland Chapter, American College of Surgeons; Maryland Psychiatric Society; Maryland Dermatological Society; and Maryland Chapter, Industrial Medical Association. All members of the Committee shall be members of the Faculty. Should any specialty group fail to submit a nomination within sixty days from the date requested to do so, the President may appoint any member of the specialty group to fill the vacancy. Nine members of the committee shall constitute a quorum.

To amend Article XIII of the Bylaws by substituting for it the following new Article XIII:

Article XIII—Disciplinary Procedures

Section 1. The "Principles of Medical Ethics" of the American Medical Association are adopted as the ethical standards of the Medical and Chirurgical Faculty of the State of Maryland and shall govern the conduct of members in their relations to each other and the public.

Section 2. The judicial powers of the Faculty, other than that vested in the Mediation Committee, shall be vested in the Executive Committee of the Council whose decision shall be final.

Section 3. Except as otherwise provided in these Bylaws the Executive Committee of the Council shall have jurisdiction on (a) all questions involving membership; (b) all controversies arising under these Bylaws and the principles of medical ethics of the American Medical Association and the Faculty; and (c) controversies between two or more component societies or their members. In addition, the Executive Committee of the Council shall have original jurisdiction where a county society to which a member belongs requests the Faculty to take disciplinary action or, when at the request of the Faculty, the county society to which the member belongs consents to disciplinary proceedings by the Faculty.

Section 4. The Executive Committee of the Council shall have appellate jurisdiction in questions of law and procedure but not of fact in all cases which arise between a member or members and the component society to which said member or members belong. Notice of appeal shall be filed with the Executive Committee of the Council within thirty (30) days of the date of the decision by the component society and the appeal shall be perfected within sixty (60) days thereof; provided, however, that the Executive Committee of the Council, for what it considers good and sufficient cause, may grant an additional thirty (30) days for perfecting the appeal.

Section 5. Any member of the Faculty, any committee of the Faculty, or a component society may file charges of unethical conduct in writing against any member of the Faculty. The Executive Committee of the Council may determine, in its discretion whether a hearing is necessary or advisable.

Section 6. A complete copy of the charges specifying the alleged unethical practice shall be promptly sent to the accused. If the Executive Committee of the Council determines that a hearing on said charges should be held, all parties shall be informed of the date, hour and place of the hearing scheduled to consider the charges which date shall not be less than ten days from the date of mailing the charges to the accused.

Section 7. All parties to the hearing may be represented by legal counsel at any hearing held by the Executive Committee of the Council.

Section 8. The Executive Committee of the Council shall adopt rules of procedure governing disciplinary actions as shall meet with the approval of the Council. All interested parties shall be furnished with copies of the rules.

Section 9. The Executive Committee of the Council may impose any of the following penalties: reprimand; suspension of imposition of penalty upon condition that the breach of ethics involved is corrected; suspension from membership generally or for a definite period or until the breach of ethics involved is corrected; and expulsion from membership. Expulsion from membership shall require a two-thirds vote of the Executive Committee of the Council.

Section 10. The accused member shall have the right to appeal the decision of the Executive Committee of the Council to the Judicial Council of the American Medical Association.

Section 11. In all matters of Judicial nature applying to Article XIII, there shall be at least five members of the Executive Committee present.

COMMITTEE DISCHARGED

On motion of Dr. Schaefer, the Professional Fee Fund Committee was finally discharged with the thanks of the House of Delegates.

HOUSE ADJOURNED

Whereupon, by unanimous consent, the House adjourned at 3:40 o'clock.

Respectfully submitted,
WILLIAM A. PILLSBURY, MD, Secretary

brings peace to the hyperactive colon

CANTIL®
(mepenzolate bromide)

helps restore normal motility and tone

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

ANNUAL MEETING
April 6, 9, 1966

MINUTES

The 253rd meeting, first of the 168th Annual Session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland, was held at the Faculty Building, 1211 Cathedral Street, Baltimore, Maryland, at 8:05 PM, Tuesday, April 26, 1966, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate:

Doctors: John G. Ball, Montgomery County; Edward M. Barczak, Baltimore City; Richard D. Bauer, Council; E. I. Baumgartner, Council; Harry McB. Beck, Baltimore City; Donald W. Benson, Baltimore City; Horace W. Bernton, Montgomery County; M. McKendree Boyer, Past-president; Wendell J. Burkett, Kent County; Read N. Calvert, Montgomery County; Robert vL. Campbell, President; Douglas G. Carroll, Baltimore City; *Katharine A. Chapman, Montgomery County; Robert G. Chambers, Baltimore City; Henry V. Chase, Council; Archie R. Cohen, Washington County; H. Douglas Cooper, Wicomico County; Ernest I. Cornbrooks, Baltimore City; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore City; John B. DeHoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; Everett S. Diggs, Council; J. Sheldon Eastland, Past-president; William C. Ebeling, Council; Emanuel S. Ellison, Baltimore City; Robert W. Farr, Council; Whitmer B. Firor, Past-president; Russell S. Fisher, Council; *Charles J. Foley, Jr., Harford County; *Harold H. Gist, Washington County; Seymour Goldgraben, Cecil County; *Paul F. Guerin, Baltimore City; William B. Hagan, Prince George's County; John C. Harvey, Baltimore City; John S. Haught, Prince George's County; William G. Helfrich, Baltimore City; Philip W. Heuman, Harford County; James P. Jarboe, St. Mary's County; Ferd E. Kadan, Baltimore City; James R. Karns, Baltimore City; Fayne A. Kayser, Council; Lauriston L. Keown, Baltimore City; Robert C. Kimberly, Council; Howard F. Kinnamon, Past-president; *John I. F. Knud-Hansen, Talbot County; C. Rodney Layton, Queen Anne's County; Herbert H. Leighton, Garrett County; F. Ford Loker, Baltimore City; Charles R. MacDonald, Anne Arundel County; William J. McClafferty, Baltimore City; Karl F. Mech, Council; Philip W. Mercer, Carroll County; B. Martin Middleton, Council; John E. Miller, Baltimore City; Donald Mintzer, Baltimore City; Andrew C. Mitchell, Wicomico County; Frank K. Morris, Board of Medical Examiners; *Arturo M. Monteiro, Charles County; Howard T. Morse, Montgomery County; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Past-president; William A. Pillsbury, Secretary; J. Emmett Queen, Council; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas Reid, Frederick County; Paul F. Richardson, Baltimore City; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Salvador Rossello, Baltimore City; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; Thaddeus C. Siwinski, Baltimore County; R. Kennedy Skipton, Prince George's County; John N. Snyder, Baltimore County; Aaron C. Sollod, Baltimore City; *William G. Speed, III, Baltimore City; Omar D. Sprecher, Jr., Washington County; Harvey B. Stone, Past-president; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; *Ivory U. Sully, Jr., Worcester County; Aaron H. Traum, Montgomery County; Thomas E. VanMetre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson Walden, Baltimore City; Hugh W. Ward, Calvert County; J. Arthur Weinberg, Council; Lawrence R. Wharton, Jr., Baltimore City; Daniel Wilfson, Jr., Baltimore City; Charles H. Williams, Baltimore County; Eldridge H. Wolff, Dorchester County; Donald O. Wood, Baltimore County; *Charles E. Wright, Frederick County; George H. Yeager, Past-president; Raymond M. Yow, Council.

Present also for the meeting were staff personnel.

The President made several announcements concerning the transaction of business at the meeting and for informational purposes.

MINUTES

The minutes of the September 10, 1965, session; and the January 29, 1966, special session, having been approved by the Executive Committee and having been distributed to all delegates, were presented to the House for information. The minutes of the January 29 session were amended to show the following additional delegate as being present:

Ferd E. Kadan, M.D., Baltimore City

VISITING MEDICAL SOCIETY PRESIDENT

William B. West, M.D., President of the Pennsylvania Medical Society, was introduced to the House and presented greetings from his organization.

NECROLOGY

After the Secretary read the following names of deceased members, the House of Delegates members rose in observance of a moment's silence in respect for their deceased colleagues:

Allegany County	
Trevaskis, R. W.	September 6, 1965
Anne Arundel County	
Field, Edward G.	October 9, 1965
Martin, James R.	November 14, 1965
Baltimore City	
Bishop, George W.	July 6, 1965
Carey, T. Nelson	March 12, 1966
Davidov, Nathan J.	November 25, 1965
Fox, Leon A.	June 5, 1965
Goldstein, Albert E.	February 22, 1966
Gordy, Lyle L.	March 22, 1965
Hundley, J. Mason, Jr.	December 9, 1965
Kunkowski, Mitchell F.	December 25, 1965
Levin, Milton	November 16, 1965
Levy, Isidore I.	June 27, 1965
Lord, Mason F.	November 16, 1965
Marino, Frank C.	April 17, 1965
Molling, Peter A.	September 7, 1965
Moses, Bessie L.	March 25, 1965
Ridgely, Irwin O.	December 28, 1965
Rowland, William M.	February 28, 1966
Smith, Frank R., Jr.	March 31, 1965

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

TREASURER'S REPORT AND AUDITOR'S REPORT

The Treasurer then presented the 1966 budget for information, it having been adopted by the Council in accordance with the Bylaws. The report of the Treasurer for the year 1965 having been distributed, the auditor's report was adopted.

NOMINEE FORM FOR SECURITIES ADOPTED

The Treasurer then presented a supplemental report and recommended the adoption of Nominee Form for securities of the Faculty. The following resolution was adopted:

Resolved, That the Maryland National Bank as agent for the Medical and Chirurgical Faculty of the State of Maryland, be and is hereby authorized to transfer, or cause to be transferred, all stocks and other registerable securities now held or hereafter to be acquired by the Medical and Chirurgical Faculty of the State of Maryland to the name of the bank's nominee "All & Co."; and

Resolved, That the Treasurer of the Medical and Chirurgical Faculty of the State of Maryland is hereby authorized to execute any and all instruments necessary, proper or desirable for that purpose.

EMERITUS MEMBERSHIP

On motion of the Chairman of the Council, the following members who had received the recommendation of the Council, were elected to Emeritus Membership:

Baltimore City	J. Edmund Bradley, M.D.
	Nicholson J. Eastman, M.D.
Baltimore County	Mary McK. Cushing, M.D.
	Robert Hening, M.D.
Dorchester County	Simon Virkutis
Kent County	Manfred J. Gerstley, M.D.
	Eugene Kester, M.D.
Montgomery County	J. Marion Bankhead, M.D.
	Edith H. Weigert, M.D.
	Naomi Lucius, M.D.
Talbot County	H. Dabney Kerr, M.D.

EDUCATIONAL FUND APPROPRIATION

On motion of the Chairman of the Committee on Postgraduate Education, Preventive Medicine and Public Health, the following motion was adopted unanimously:

That the House of Delegates appropriate from the Educational Fund an additional amount up to $10,000 to be used through December 31, 1966, by the Continuing Medical Education Program Subcommittee to continue and expand the MEDIC Network.

NOMINATING COMMITTEE REPORT

The Secretary, on behalf of the Nominating Committee, presented the following slate of officers, the Chairman of the Nominating Committee being deceased:

President-elect
- Richard D. Bauer, Adelphi (President-elect 1966-67; President 1967-68)

First Vice-president
- Houston S. Everett, Baltimore

Second Vice-president
- J. Howard Beard, Annapolis

Third Vice-president
- Francis J. Townsend, Ocean City

Secretary
- William A. Pillsbury, Timonium

Treasurer
- Karl F. Mech, Baltimore

Councilors
- William Carl Ebeling, Baltimore, Central District (1970)
- J. Arthur Weinberg, Baltimore, Central District (1970)
- John F. Schaefer, Baltimore, Central District (1970)
- John Collins Harvey, Baltimore, Central District (1970)
- William G. Speed, III, Baltimore, Central District (1970)
- Eldridge H. Wolff, Cambridge, Eastern District (1970)
- William B. Hagan, Riverdale, South Central District (1969) (to assume office 1966)
- Henry P. Laughlin, Bethesda, South Central District (1970)

Delegate to American Medical Association
- Russell S. Fisher, Baltimore (Jan. 1, 1967-Dec. 31, 1969)

Alternate Delegate to American Medical Association
- M. McKendree Boyer, Damascus (Jan. 1, 1967-Dec. 31, 1969)

Committee on Program and Arrangements
- Arlie R. Mansberger, Jr., Baltimore (1971)

Library and History Committee
- Katharine A. Chapman, Kensington (1972)

Finney Fund Committee
- Richard G. Coblentz, Baltimore (1972)

Board of Medical Examiners
- Elmer G. Linhardt, Eastport (June 1966-June 1970)

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

William L. Stewart, Westminster (June 1966-June 1970)

The floor was opened to further nominations for these officers, and there being none, nominations were, by general consent, closed, the election to be held at the second meeting of the session, Friday, April 29, 1966, at the Faculty Building. The nominees for the Board of Medical Examiners are to be elected at the General Session, Thursday, 11:45 AM, April 28, 1966, at the Alcazar.

FIFTY YEAR PIN PRESENTATION

The President, on behalf of the Faculty, then presented Fifty-Year pins to those members who were able to be present at this session. The following members were so honored at this meeting:

Clarence I. Benson, Port Deposit
Paul W. Clough, Baltimore
G. C. Coulbourne, Marion Station
Frank W. Hachtel, Baltimore
John F. Hogan, Sr., Baltimore
Kenneth B. Jones, Church Creek
John T. King, Baltimore
G. A. Kohler, Smithsburg
Ernest G. Marr, Baltimore
Robert H. Riley, Catonsville
John G. Runkel, Baltimore
G. L. Stickney, Baltimore
Harvey B. Stone, Baltimore

VIET NAM PLAQUES PRESENTATION

The President, on behalf of the American Medical Association, then presented Plaques of Recognition for voluntary service in Viet Nam for 60 days to:

Robert E. Eby, M.D., Olney, Md.
(December, 1965—February, 1966)
Stephen M. Nagy, M.D., Baltimore, Md.
(September, 1965—November, 1965)

A plaque for Richard W. TeLinde, M.D., Baltimore, Md. (March 1963-April, 1963) is to be presented at a later date. Dr. TeLinde was unable to be present.

REPORT OF AMA DELEGATES

The report of the Faculty's Delegates to the American Medical Association was filed, after a request for comments with respect to a proposed $25 increase in the AMA dues received no response.

BYLAWS COMMITTEE REPORT

Dr. O'Donnell, Bylaws Committee chairman, on its behalf, moved the adoption of the following Bylaw amendments which, after debate, were adopted in each case by more than a two-thirds vote:

ARTICLE III, Section 6

To amend Article III, Section 6, by substituting for it the following new Sections 6 and 7 (the remaining sections of the Article automatically being renumbered).

Section 6. The House of Delegates may impose an assessment which shall be paid with, and at the same time as, dues by all active members. The failure of a member to pay an assessment shall be treated as a failure to pay dues as provided in this Article. Notice of a proposal to impose an assessment, and the amount thereof, shall be sent to all delegates at least sixty days before the session at which action is taken, and no amendment shall be in order which would have the effect of increasing the amount of the proposed assessment above that for which notice was given.

Section 7. The Council may, upon the request of a member's component society, remit a member's dues or assessments for reasons of illness, financial hardship or temporary service in the armed forces or the United States Public Health Service.

To amend Article XV by adding: "Provided that any amendment which proposes to increase dues or levy an assessment for any class of membership shall be sent to all delegates at least sixty days before the session at which action is to be taken."

Any amendment to these bylaws submitted by the Bylaws Committee and sent to all delegates with the call to the session may be adopted by the House of Delegates by a two-thirds vote, provided that any amendment which proposes to increase dues or levy an assessment for any class of membership shall be sent to all delegates at least sixty days before the session at which action is to be taken.

To amend the bylaws by inserting after Article IX the following new Article X (succeeding articles to be automatically renumbered):

Section 1. There shall be a Med-Chi Insurance Trust composed of six Trustees, and it shall have the powers and duties as are provided from time to time by the Trust Agreement and any amendments thereto.

Section 2. Two Trustees of the Med-Chi Insurance Trust shall be appointed by the President as soon as practicable after the annual session each year for a term of three years or until their successors are appointed and qualified. The President shall promptly appoint a Trustee to fill the unexpired term in the event of any vacancy among the Trustees caused by resignation, death, or removal.

To amend Article X, Committees, by inserting after Section 7 the following new section 8 (succeeding sections to be automatically renumbered):

Section 8. *A FINANCE COMMITTEE* to advise and counsel the Treasurer regarding the Faculty's financial and investment program shall be composed of the Treasurer and four other members, one of whom shall be appointed by the President each year for a four-year term. The President shall annually designate the chairman of the committee.

INFORMATION COMMITTEE REPORTS

The following reports were distributed in writing for the information of the meeting and an opportunity was afforded at this time to raise any questions:

Secretary—William A. Pillsbury, M.D.
Board of Medical Examiners—Frank K. Morris, M.D., Secretary
Executive Secretary—Mr. John Sargeant
Library and History Committee and Finney Fund Committee—Louis Krause, M.D., and George G. Finney, Sr., M.D.
Curator—Edwin David Weinberg, M.D.
Committee on Program and Arrangements—John C. Harvey, M.D.
American Medical Association Education and Research Foundation Committee—William S. Stone, M.D.
Economics Committee—Paul F. Guerin, M.D.
Editorial Board, Maryland State Medical Journal—George H. Yeager, M.D.
Committee on Emotional Health—Augusto J. Esquibel, M.D.
Fee Schedule Committee—William G. Speed, III, M.D.
Ad Hoc Finance Committee—Karl F. Mech, M.D.
Legislative Committee—B. Martin Middleton, M.D.
Liaison Committee—John F. Schaefer, M.D.
Faculty Representatives on the Maryland Joint Council to Improve the Health Care of the Aged—Albert E. Goldstein, M.D. (Deceased)
Mediation Committee—Wolcott L. Etienne, M.D.

In fact, there's as much iron...250 mg. ...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses. Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

SUPPLEMENTAL FEE SCHEDULE COMMITTEE REPORT

Dr. Speed, on behalf of the Fee Schedule Committee, presented the following resolutions for consideration of the House of Delegates. On more than a two-thirds vote, it was agreed to consider them and, after debate and amendment, they were adopted as follows:

Resolved, That this House of Delegates reaffirm the Principle of Resolution 1 S/65, as adopted September 10, 1965, "that usual and customary fees be paid to private practicing physicians rendering care to . . . medical care program patients"; and

Resolved, That the President be required to appoint a Subcommittee of the Fee Schedule Committee to deal with (a) all problems relating to PL 89-97 (Medicare) as it pertains to physicians' services; and (b) to deal with the fiscal intermediary for physicians' fees as they pertain to Title XVIII or XIX of this law, such Subcommittee to be composed of at least four members, not excluding Faculty members who are not members of the Fee Schedule Committee.

Thereupon, the House adjourned at 10:00 PM.

Respectfully submitted,
WILLIAM A. PILLSBURY, MD, Secretary

ELECTION OF THE BOARD OF MEDICAL EXAMINERS OF MARYLAND

A general meeting of the Medical and Chirurgical Faculty of the State of Maryland was held on Thursday, April 28, 1966 at 11:45 a.m., at the Alcazar, Cathedral and Madison Streets, Baltimore, Maryland, for the purpose of electing two members of the Board of Medical Examiners of Maryland.

The President, Robert vL. Campbell, M.D., presided and called the meeting to order.

The names of the two nominees were presented to the General Meeting, as follows:

Elmer G. Linhardt, M. D. (June 1966-June 1970)
William L. Stewart, M. D. (June 1966-June 1970)

Nominations from the floor were requested. There being none, the Chairman declared nominations closed.

Election took place by acclamation, and the Secretary, William A. Pillsbury, M. D., was instructed to cast one ballot for those nominated.

There being no further business, the meeting adjourned at 11:55 AM.

Respectfully submitted,
WILLIAM A. PILLSBURY, MD, Secretary

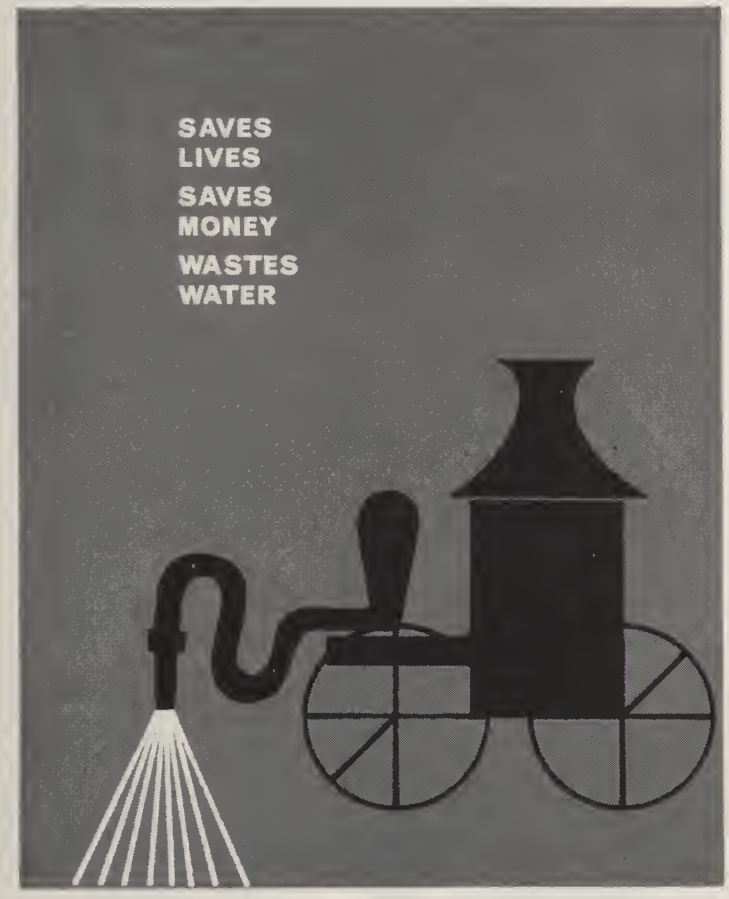
MINUTES

The 254th meeting, second of the 168th annual session of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland, was held at the Faculty Building, 1211 Cathedral Street, Baltimore, Maryland, at 9:00 AM, Friday, April 29, 1966, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance; an asterisk indicates an alternate delegate.

Doctors: John G. Ball, Montgomery County; Richard D. Bauer, Council; *Philip J. Bean, St. Mary's County; Harry McB. Beck, Baltimore City; Horace W. Bernton, Montgomery County; Wendell J. Burkett, Kent County; Read N. Calvert, Montgomery County; Robert vL. Campbell, President; Douglas G. Carroll, Baltimore City; *Katharine A. Chapman, Montgomery County; Robert G. Chambers, Baltimore City; Henry V. Chase, Council; Archie R. Cohen, Washington County; H. Douglas Cooper, Wicomico County; Ernest I. Cornbrooks, Baltimore City; Worth B. Daniels, Jr., Baltimore City; John B. De Hoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; Everett S. Diggs, Council; J. Sheldon Eastland, Past-president; William C. Ebeling, Council; Emanuel S. Ellison, Baltimore City; Robert W. Farr, Council; James McC. Finney, Harford County; Whitmer B. Firor, Past-president; Russell S. Fisher, Council; *Harold H. Gist, Washington County; William B. Hagan, Prince George's County; John C. Harvey, Baltimore City; John S. Haught, Prince George's County; Lauriston L. Keown, Baltimore City; Norman Levin, Baltimore City; F. Ford Loker, Baltimore City; Charles R. MacDonald, Anne Arundel County; William J. McClafferty, Baltimore City; Karl F. Mech, Treasurer; Philip W. Mercer, Carroll County; John E. Miller, Baltimore City; *Robert Miller, Allegany County; Donald Mintzer, Baltimore City; Andrew C. Mitchell, Wicomico County; Frank K. Morris, Board of Medical Examiners; Howard T. Morse, Montgomery County; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Past-president; William A. Pillsbury, Secretary; *Carolyn S. Pincock, Montgomery County; J. Emmett Queen, Council; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas Reid, Frederick County; Paul F. Richardson, Baltimore City; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Salvador Rossello, Baltimore City; Edwin Ruzicka, Talbot County; John F. Schaefer, Council; Emmanuel Schimunek, Baltimore City; Thaddeus C. Siwinski, Baltimore County; R. Kennedy Skipton, Prince George's County; John N. Snyder, Baltimore County; Aaron C. Sollod, Baltimore City; Omar D. Sprecher, Jr., Washington County; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; Thomas E. VanMetre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson Walden, Baltimore City; Hugh W. Ward, Calvert County; William H. F. Warthen, Past-president; J. Arthur Weinberg, Council; *William C. Weintraub, Prince George's County; Daniel Wilfson, Jr., Baltimore City; Charles H. Williams, Baltimore County; Donald O. Wood, Baltimore County; *Charles E. Wright, Frederick County; John D. Young, Jr., Baltimore City; Raymond M. Yow, Council.

Present also for the meeting were staff personnel.



The President made several announcements regarding the transaction of business at the meeting and for informational purposes.

BOARD OF MEDICAL EXAMINERS ELECTIONS

The President advised the House of Delegates of the election of the members of the Board of Medical Examiners at the General Meeting held on April 28, 1966:

Elmer G. Linhardt, M.D., Eastport (June, 1966-June, 1969)

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides.* Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day.*

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

Finney Fund Committee
Richard G. Coblentz, Baltimore (1972)

REFERENCE COMMITTEE REPORT RESOLUTION 1 A/66 ADOPTED

Dr. Hagan, on behalf of the Reference Committee, reported to the House with respect to Resolution 1 A/66, and recommended that it be adopted. The House adopted Resolution 1 A/66, which read as follows:

Whereas, It is now the declared policy of the American College of Radiology that members of the College shall separate their professional fees from hospital charges and present their own bills to all patients expected to pay for services; and

Whereas, The House of Delegates of the American Medical Association on October 3, 1965, stated, "Hospital-based medical specialists are engaged in the practice of medicine. The fees for the services of such specialists should not be merged with hospital charges. The charges for the services of such specialists should be established, billed and collected by the medical specialist in the same manner as are the fees of other physicians."; and

Whereas, Congress established under the Medicare Law, PL 89-97, provisions covering Radiology solely as a medical service, and radiologists are obligated to obey these legislative provisions, and

Whereas, The identification of radiology as a hospital service has led physicians away from training in the specialty or radiology, and has jeopardized the future of radiological practice and thus of all medical care due to professional personnel shortages; and

Whereas, Separate billing for professional services is feasible and desirable for *all* patients served by radiologists in hospital departments, just as it is for surgeons, obstetricians, internists, anesthesiologists, and other practitioners of medicine; now, therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland supports the policy of the American College of Radiology, the American Medical Association, and of Medicare law PL 89-97, of separating professional fees from hospital charges; and

Resolved, That copies of this resolution be sent to the American College of Radiology, the Hospital Council of Maryland, Maryland Hospital Service, Inc., and Maryland Medical Service, Inc.

RESOLUTION 2 A/66 ADOPTED

Dr. Hagan, on behalf of the Reference Committee, recommended that Resolution 2 A/66 be adopted. The House adopted Resolution 2 A/66, which read as follows:

Whereas, The shortage of properly qualified medical technologists remains acute, appears to be worsening and will become more and more acute in response to the increasing demands of coming years, and in view of the fact that there is a profession in which the work involved is becoming increasingly complex and important to patient care so that it is felt action must be taken at once to relieve the situation; therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland requests that the Maryland General Assembly appropriate the initial sum of at least fifty thousand dollars for the establishment of a formal School of Medical Technology at the University of Maryland and that sufficient appropriations be made annually thereafter for maintenance of same; and

Resolved, That the University of Maryland be commissioned and designated to establish and operate this school on a scale specifically designed to benefit equitably all geographic areas in the State of Maryland and expressly with the purpose of relieving present and future shortages in medical technologists in all areas of the State of Maryland; and

Resolved, That this School of Medical Technology be established within the University of Maryland in an organizational manner analogous to that of the Schools of Medicine, Dentistry and Pharmacy; that the standards maintained in this school be satisfactory to the American Medical Association, the American Society of Clinical Pathologists, and the American Society of Medical Technologists, and to their respective Maryland component societies, and that the graduates be awarded the B.S. degree and be eligible by examination for certification and the professional designation M.T. (ASCP).

ADDITIONAL RECOMMENDATION

Dr. Hagan, on behalf of the Reference Committee, recommended adoption of the following two recommendations, with regard to the implementation of Resolution 2 A/66, which the House adopted:

(1) That all appropriate universities and colleges in Maryland be requested to give this possibility some study and be advised that the counsel and advice of the Faculty and its members are available in this area.

BRING IT DOWN AND KEEP IT DOWN

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

(2) That the Faculty's Legislative Committee and approved Legislative Representative at the General Assembly sessions be instructed to work closely with the University of Maryland in insuring that funds for development of this course of training are retained in the University of Maryland budget.

RESOLUTION ADOPTED

Dr. Ball, on behalf of the Montgomery County Medical Society, moved adoption of a resolution. The House, after approving its consideration by more than a two-thirds vote, took a five minute recess at 9:40 am.

The House reconvened at 9:45 am, and after debate and amendment adopted the resolution as follows:

Whereas, The enactment of Public Law 89-97 (Medicare) will create many problems and, while this resolution does not imply endorsement of such legislation, we are of the opinion that the medical profession throughout the nation has a responsibility to the public in assisting in resolving any problems relating to care being provided under PL 89-97, such as Physicians' Care, Home Care, Extended Care Facilities and Hospital Care; therefore be it

Resolved, That the Faculty's Delegates to the American Medical Association be instructed to introduce a resolution into the AMA House of Delegates at the 1966 annual session in Chicago, substantially as follows:

"*Resolved,* That all constituent associations of the American Medical Association be urged to establish Medicare Coordinating Committees in communities throughout the areas they serve, such Committees to provide local medical leadership within the proper scope of the Physician/Patient Relationship in (a) developing policies and standards to meet problems arising under PL 89-97 (Medicare); (b) provide a forum for the exchange of facts and ideas affecting Community Agencies."

SUBJECTS RULED OUT OF ORDER

Dr. M. B. Levin, being granted the privilege of addressing the House of Delegates, raised three points of order.

Accordingly, the Chair ruled that all the points of order were not well taken.

(1) The Baltimore City Medical Society has selected the allotted number of delegates and alternates to the House of Delegates of the Medical and Chirurgical Faculty of Maryland.

(2) The decision of the Courts in the case of *Levin vs Medical and Chirurgical Faculty, et al,* finally determined that the Faculty need not provide for proxy or mail voting and the issue is closed.

(3) It was proper for the Special Session of the House at which the $50 assessment was imposed to amend the assessment resolution; such amendment did not exceed the scope of the notice of the meeting, and the present point of order was not timely made.

There being no further business, the President made several announcements, following which he introduced to the House of Delegates the new President, J. Morris Reese, M.D., who assumed the Chair and, following brief acceptance remarks, and by unanimous consent, declared the House adjourned *sine die,* at 10:10 AM.

Respectfully submitted,
WILLIAM A. PILLSBURY, M.D., Secretary

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®

(desipramine hydrochloride)

non-sedating · rapid-acting
ANTIDEPRESSANT

restores normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) reverses the signs and symptoms of depression including sleep disturbances, feeling of sadness, guilt, worthlessness, anxiety and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, more active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

TREASURER

Mr. President and Members of the House of Delegates:

The auditor's statement for 1965 together with our budget for 1966 have already been distributed to you. We are in fine shape financially. I am sure you all have had a chance to look over these statements, and I shall be glad to answer any questions you might have. Your particular attention is invited to the restricted fund statement contained in the auditor's report. This indicates current accumulated income from these sources as well as the purposes for which such money may be spent.

At the present time, I have one additional recommendation to make. Over the years we have been somewhat hampered by the fact that some companies will not accept anything but a formal resolution by this House as authority for sale of stock. As you know, we have investment counsel in T. Rowe Price and Company, who advise us on our portfolio of investments.

We have discussed this entire matter at some length in the Ad Hoc Finance Committee and have consulted with our legal counsel, investment counsel, and Maryland National Bank, the custodian of our investment portfolio. All agree that our investments should be registered in the nominee form of registration. This is common practice with organizations, and we have the following resolution to present with the recommendation that it be adopted:

RESOLVED: That the Maryland National Bank as agent for the Medical and Chirurgical Faculty of the State of Maryland, be and is hereby authorized to transfer, or cause to be transferred, all stocks and other registerable securities now held or hereafter to be acquired by the Medical and Chirurgical Faculty of the State of Maryland to the name of the bank's nominee "All & Co."

And that the Treasurer of the Medical and Chirurgical Faculty of the State of Maryland is hereby authorized to execute any and all instruments necessary, proper or desirable for that purpose.

I want to express sincere thanks to the staff for their great help, and especially to Mr. Sargeant and to Mr. Harrison, our accountant-office manager, to whom we are indebted for the expert keeping of our accounts.

Respectfully submitted,
KARL F. MECH, MD, Treasurer

EXPLANATORY NOTES ON 1966 PROPOSED BUDGET

Budgetary items for 1966 are predicated on actual cost for 1965. Only items where there is a substantial change will have explanatory notes.

A. Contributions

Student AMA	$250.00
National Society for Medical Research	50.00
Miscellaneous (Maryland League for Nursing)	300.00
TOTAL	$600.00

B. Salaries

Reflected in this figure are anticipated salary increments during 1966, plus offsetting amounts shown under receipts from Faculty's Insurance Trust and the Baltimore City Medical Society for services of its employees on Faculty payroll.

In addition, all employees salaried and hourly rated are included in this figure, decreasing similar amounts under library and household and janitorial services items.

C. Travel

The following items are budgeted for travel during 1966:

Professional Convention Management Association and Medical Exhibitors Association, Las Vegas, Nevada,
January 3-6 — One Staff Member

National Conference on Federal Medical Assistance Programs, Chicago, Illinois,
January 20-21 — One Staff Member

Annual Medicolegal Conference, Chicago, Illinois,
April 15-16 — One Staff Member

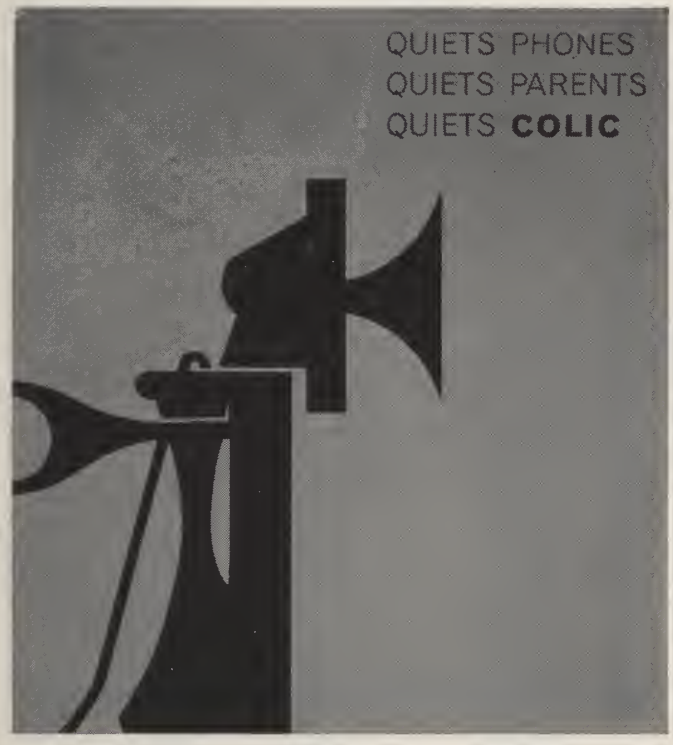
Medical Society Executives Assn. (1 Day) and AMA Annual Meeting (5 Days), Chicago, Illinois,
June, 1966 — One Staff Member, Three Delegates, Senior Alternate Delegate

Medical Society Executives Assn. (1 Day) and AMA Annual Institute (2 Days), Chicago, Illinois,
August, 1966 — Two Staff Members

American Medical Association House of Delegates (4 Days), Las Vegas, Nevada,
December, 1966 — One Staff Member, Three Delegates, Senior Alternate Delegate

Journal

State Medical Journal Advertising Bureau Meeting, Chicago, Illinois,
October, 1966 — One Staff Member



American Medical Writers' Assn. Meeting, New York City,
October, 1966 — One Staff Member

Library

Advisory Board, Special Libraries Assn., Albuquerque, New Mexico,
January 20-22 — One Staff Member

Special Libraries Assn. Annual Meeting, Minneapolis, Minnesota,
May 29-June 3 — One Staff Member

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

Increase in mileage allowance to 12¢ per mile.
Any travel for which the Faculty is reimbursed by the AMA or other affiliated, allied or associated groups is approved without reference to the Executive Committee. The increase in total dollars for 1966 on travel is occasioned by the distance of the Clinical session of the American Medical Association scheduled for Las Vegas.

D. Legislative

Operation of Legislative First Aid Room	$1,200.00
Distribution of Legislative Newsletter (5 issues)	2,000.00
Copies of legislation	200.00
Legislative Representatives expenses (Travel, meals, telephone, etc.)	500.00
Expenditures for federal legislation	1,100.00
TOTAL	$5,000.00

E. Library Expenses

Total per Library Budget	$24,670.00
Less: Amount included in Salaries Account	20,360.00
Library Expense of General Fund	$4,310.00

Journal Subscriptions, books and binding are not included in above, but are purchased out of income from specific funds for Library purposes.

Light, Heat, Telephone, Payroll Taxes, etc., are also excluded.

in diarrhea

LOMOTIL® Tablets / Liquid

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . 2.5 mg.
(Warning: May be habit forming)
atropine sulfate . . . . . 0.025 mg.

is a corker

Effectiveness: Lomotil possesses a unique degree of effectiveness in both acute and chronic diarrhea.

Convenience: Lomotil is supplied as small, easily carried, easily swallowed tablets and as a pleasant, fruit-flavored liquid.

Versatility: The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or as adjunctive therapy in diarrhea associated with:

- **Ulcerative colitis**
- **Acute infections**
- **Irritable bowel**
- **Regional enteritis**
- **Drug therapy**
- **Food Poisoning**
- **Functional hypermotility**
- **Malabsorption syndrome**
- **Ileostomy**
- **Gastroenteritis and colitis**

Dosage: For full therapeutic effect—Rx full therapeutic dosage. The recommended initial daily dosages, given in divided doses, until diarrhea is controlled, are:

Children: 3 to 6 months — 3 mg. (½ tsp.* t.i.d.)
6 to 12 months — 4 mg. (½ tsp. q.i.d.)
1 to 2 years — 5 mg. (½ tsp. 5 times daily)
2 to 5 years — 6 mg. (1 tsp. t.i.d.)
5 to 8 years — 8 mg. (1 tsp. q.i.d.)
8 to 12 years —10 mg. (1 tsp. 5 times daily)

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily)

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the therapeutic dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

CERTIFICATE

The Medical and Chirurgical Faculty
of the State of Maryland,
1211 Cathedral Street,
Baltimore, Maryland 21201

Gentlemen:

We have made an audit of the records in the office of the Treasurer of the Medical and Chirurgical Faculty of the State of Maryland for the year ended December 31st, 1965. Our examination was made in accordance with generally accepted auditing standards, and accordingly included such tests of the accounting records and such other auditing procedures that we considered necessary in the circumstances.

In our opinion, the Exhibits, together with the comments in this report, present fairly the financial position of the Faculty as of December 31st, 1965 and the results from operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Respectfully submitted,
Wooden, Benson & Walton
Members of American Institute of Certified Public Accountants

SECRETARY

Mr. President and Members of the House of Delegates:

The following component societies have 100% paid-up membership by January 31, 1965: Charles, Howard, Queen Anne's, Somerset, Talbot, and Worcester Counties.

At the request of the component societies, the Faculty handled the dues-billing for the following: Allegany, Anne Arundel, Baltimore, Calvert, Carroll, Cecil, Dorchester, Frederick, Garrett, Harford, Kent, Queen Anne's, Washington, Wicomico, and Worcester Counties.

Membership in the American Medical Association as of December 31, 1965, totaled 2,825.

Blue Cross and Blue Shield enrollment through the Faculty group plan increased from 1,298 in 1964 to 1,376 in 1965.

During the calendar year 1965, 403 meetings were held in the Faculty building by medically oriented groups.

Complete records of all Faculty committees and subcommittees are kept in the Faculty office. These are available for the perusal of Faculty members or chairmen so they may be aware of previous actions in these areas.

Respectfully submitted,
William A. Pillsbury, MD, secretary

COUNCIL

Mr. President and Members of the House of Delegates:

Both the Council and the Executive Committee met at regular intervals during the past year. Business transacted at these meetings has been summarized in the *Maryland State Medical Journal* so that all members are aware of the range of activities in which the Society is engaged.

The Executive Committee held several meetings with its counterpart of the Hospital Council. Discussion was primarily limited to a completion of the various Gruehn Committee report's recommendations and to various facets of the Medicare legislation (PL 89-97).

Physicians defense was ratified for 29 members requesting this privilege. We again emphasize the necessity for members to remain in good standing in order to retain their rights to this benefit. Individually, physicians cannot afford to be without this added protection against suit, and is provided only through Faculty membership.

A complete record of all activity, in detail, is maintained in the Faculty office and is available to those authorized to examine these minutes. Data on any activity, individually, may be obtained on request by any member who has a legitimate need for it.

Business routinely transacted includes the making and

approving of various official appointments, acting on recommendations from Faculty committees, approving special expenditures of funds, and acting on various staff matters.

The Council recommends emeritus membership for the following:
J. Edmund Bradley, M.D., Baltimore City
Nicholson J. Eastman, M.D., Baltimore City
Mary McK. Cushing, M.D., Baltimore County
Manfred J. Gerstley, M.D., Kent County
Eugene Kester, M.D., Kent County
J. Marion Bankhead, M.D., Montgomery County
Edith H. Weighert, M.D., Montgomery County
H. Dabney Kerr, M.D., Talbot County

Respectfully submitted,
Russell S. Fisher, MD, chairman

EXECUTIVE SECRETARY

Mr. President and Members of the House of Delegates:

This year concludes eight years of service with the Medical and Chirurgical Faculty as its executive secretary. During the past year much reorganization and reassignment of duties have taken place, making for a more efficient working force and better utilization of staff time.

The results of staff activity are apparent in the various committee, subcommittee, and board reports made elsewhere. Nearly all such groups were staffed with office personnel, resulting in timely implementation of recommendations and prompt completion of minutes, correspondence, and reports.

A record number of inquiries was handled from the public, from the members, and from associated organizations. Liaison with allied professional groups continues at a high level. All of this work has been done without increasing the number of personnel on the Faculty payroll. At times, however, it has been necessary to "job-lot" work out for completion in order to meet necessary deadlines.

The Faculty has an efficient, functioning operation that is the envy of many other professional groups in the community. While many of our own members may not praise our efforts, members of other groups consider the Faculty a well-organized and effective force in the state.

Respectfully submitted,
John Sargeant

AMERICAN MEDICAL ASSOCIATION EDUCATION AND RESEARCH FOUNDATION COMMITTEE

Mr. President and Members of the House of Delegates:

In 1965, Maryland physicians gave $9,605 to medical education through the AMA-ERF. The check was formally presented at the AMA clinical meeting in Philadelphia by Robert vL. Campbell, MD, Maryland delegate to the AMA and president of the Medical and Chirurgical Faculty.

From the national total collected in 1965, the University of Maryland School of Medicine receives $15,738.43 and the Johns Hopkins University School of Medicine receives $10,282.99. As has been the custom, the checks will be presented to the deans of the respective medical schools at the Presidential Dinner.

Respectfully submitted,
William S. Stone, MD, chairman
Albert L. Anderson, MD
Richard D. Bauer, MD
Newland E. Day, MD
Abraham Genecin, MD
William B. Gunther, MD
Bender B. Kneisley, MD
J. Douglass Shepperd, MD
Vernon M. Smith, MD
Thomas B. Turner, MD

BOARD OF MEDICAL EXAMINERS

Mr. President and Members of the House of Delegates:

Examinations given during the year show the following results:

Applications received for examination			583
Second year students examined and re-examined	119		
Postponed, withdrawn, or did not appear	75		
Failed to complete	2		
Re-examined after license to meet requirements of other State Boards	1		
Not eligible for license			197
Examined in second part of examination	125		
Complete examination given	179		
Re-examined	82		
Eligible for license			386
Passed—American Graduates	168		
Passed—Foreign Graduates	116	284	
Failed—American Graduates	14		
Failed—Foreign Graduates	88	102	386

The American schools which had failures are as follows:

Hahnemann	1
Howard	5
Jefferson	1
Johns Hopkins	2
Meharry	2
University of Maryland	1
University of Miami	2

Licenses issued after written examination	284
Licenses issued after special examination	2
Licenses issued by endorsement of other states' licenses	148
Licenses issued by endorsement of National Board Certificates	188

American graduates examined and re-examined	182
Foreign graduates examined and re-examined	204
Foreign graduates approved for examination	141
Written inquiries from foreign graduates (approximately)	422
Office interviews with foreign graduates (approximately)	250

Telephone inquiries from foreign graduates (approximately)	1,500
Telephone inquiries concerning registration of physicians	500
Registration certificates issued from 1/1/65 to 12/31/65	1,186
Total registration of physicians possessing Maryland licenses to 12/31/65	10,537

Revocation of medical license

The medical license of Bennett A. Robin, MD, was revoked on February 4, 1965, for having made a false statement in violation of 18 U.S.C. 1001. The case has been appealed.

Hearing

Yuen K. Yuan, MD, was charged with having bribed a public official in violation of 18 U.S.C. The Board's decision is not to be finalized until the expiration of Dr. Yuen K. Yuan's probation. In the interim, Dr. Yuan will report quarterly to the Executive Committee to give an account of his activities.

Reprimanded

Joseph Blum, MD, for having accepted a fee on a contingency basis.

Gunther D. Hirsch, MD, for advertising in violation of the Medical Practice Act.

Edward M. Rehak, MD, and Theodore Carski, MD, of the Maryland Diagnostic Laboratory, for issuing an unethical publication in violation of the Medical Practice Act.

Christopher Mendelis, MD, for prescribing drugs indiscriminately.

Appearing before Executive Committee Periodically to give a report on rehabilitation and professional activities, respectively: John R. Smith, Jr., MD, and Ralph F. Young MD.

Training in an approved Maryland Hospital

The Executive Committee encountered difficulty regarding the requirement of foreign graduates spending one year in approved Maryland hospital. The Board, therefore, has deleted the word "approved" in reference to a Maryland hospital.

Special Examination (oral)

After finding the following physicians eminently qualified for licensure in the State of Maryland, a medical license was issued to Leon A. Akopiantz, MD, and Ralph D. Dwork, MD

Sixty-First Annual Congress of Medical Education and Licensure

Dr. Walter C. Merkel, Dr. Vernon H. Norwood, Dr. Frank K. Morris, and Dr. Joseph D. B. King attended the Congress in Chicago on February 6-9, 1965.

Mexican and Canadian physicians practicing in Maryland without a license in time of disaster

This Board is in agreement with the Faculty statement on Item 313 in Civil Defense Medical Services to the Budget and Finance Committee Legislative Council, dated October 12, 1964, but the word "license" should be eliminated in permitting Mexican and Canadian physicians to practice medicine in the State of Maryland in time of disaster.

BRIEF SUMMARY OF ACTIVITIES FROM
January 1, 1966, to March 15, 1966

Hearings

A hearing was held on revocation of the medical license of Ulysses G. Bourne, MD, for violation of the federal law in reference to selling pep pills. The Board unanimously decided to take no further action.

An agreement has been reached in the case of Bennett A. Robin, MD. In lieu of his withdrawing his appeal, the Board will delay revoking his license for a period of three months beginning May 1, 1966, and ending August 1, 1966.

The Board notified Ralph F. Young, MD, that he has been relieved of further responsibility to the Board of Medical Examiners of Maryland in connection with the hearing on revocation and that the case is now closed.

Rent

The Board was notified by the Medical and Chirurgical Faculty that the rent for Osler Hall would be increased from $80 to $125 per day beginning January 1, 1967.

Sixty-second Annual Congress of Medical Education and Licensure

Drs. Walter C. Merkel, Vernon H. Norwood, and Frank K. Morris attended the Congress in Chicago on February 5-8, 1966.

Respectfully submitted,
FRANK K. MORRIS, MD, secretary
WYLIE M. FAW, MD
JOSEPH D. B. KING, MD
JOHN H. HORNBAKER, MD
KARL F. MECH, MD
WALTER C. MERKEL, MD
WILBER R. ELLIS, JR., MD
VERNON H. NORWOOD, MD

BYLAWS COMMITTEE

Mr. President and Members of the House of Delegates:

The Bylaws Committee has had one meeting to consider various bylaw changes. These are presented herewith for action by the House of Delegates:

ARTICLE III, Section 6

To amend Article III, Section 6, by substituting for it the following new Sections 6 and 7 (the remaining sections of the Article automatically being renumbered).

OLD

(*Italicized* portion to be deleted)

Section 6. The House of Delegates may impose an assessment in addition to dues to be paid with, and in the same manner as dues by all Active members. The Council may, upon the request of a member's component society, remit a member's dues and/or assessment for reasons of illness, financial hardship or temporary service in the Armed Forces or United States Public Health Service.

NEW

(CAPS portion to be added)

SECTION 6. THE HOUSE OF DELEGATES MAY IMPOSE AN ASSESSMENT WHICH SHALL BE PAID WITH, AND AT THE SAME TIME AS, DUES BY ALL ACTIVE MEMBERS. THE FAILURE OF A MEMBER TO PAY AN ASSESSMENT SHALL BE TREATED AS A FAILURE TO PAY DUES AS PROVIDED IN THIS ARTICLE. NOTICE OF A PROPOSAL TO IMPOSE AN ASSESSMENT, AND THE AMOUNT THEREOF, SHALL BE SENT TO ALL DELEGATES AT LEAST SIXTY DAYS BEFORE THE SESSION AT WHICH ACTION IS TAKEN, AND NO AMENDMENT SHALL BE IN ORDER WHICH WOULD HAVE THE EFFECT OF INCREASING THE AMOUNT OF THE PROPOSED ASSESSMENT ABOVE THAT FOR WHICH NOTICE WAS GIVEN.

SECTION 7. THE COUNCIL MAY, UPON THE REQUEST OF A MEMBER'S COMPONENT SOCIETY, REMIT A MEMBER'S DUES OR ASSESSMENTS FOR REASONS OF ILLNESS, FINANCIAL HARDSHIP OR TEMPORARY SERVICE IN THE ARMED FORCES OR THE UNITED STATES PUBLIC HEALTH SERVICE.

To amend Article XV by adding: "Provided that any amendment which proposes to increase dues or levy an assessment for any class of membership shall be sent to all delegates at least sixty days before the session at which action is to be taken."

OLD

Any amendment to these bylaws submitted by the Bylaws Committee and sent to all delegates with the call to the session may be adopted by the House of Delegates by a two-thirds vote.

NEW

(CAPS portion to be added)

Any amendment to these bylaws submitted by the Bylaws Committee and sent to all delegates with the call to the session may be adopted by the House of Delegates by a two-thirds vote, PROVIDED THAT ANY AMENDMENT WHICH PROPOSES TO INCREASE DUES OR LEVY AN ASSESSMENT FOR ANY CLASS OF MEMBERSHIP SHALL BE SENT TO ALL DELEGATES AT LEAST SIXTY DAYS BEFORE THE SESSION AT WHICH ACTION IS TO BE TAKEN.

Explanation: The Montgomery County Medical Society has suggested that appropriate changes in the Faculty bylaws be made so as to ensure adequate notice of any increase in dues or levying of assessments. The proposed amendments would provide for a 60-day advance notice of any such changes, thus enabling component societies to meet and duly consider such changes before the set meeting date.

This in no way prohibits the House of Delegates from having special meetings on ten days notice to consider important matters other than described above, as presently provided in the bylaws.

To amend the bylaws by inserting after Article IX the following new Article X (succeeding articles to be automatically renumbered):

OLD

(No bylaw in existence)

NEW

Article X

(CAPS portion to be added)

SECTION 1. THERE SHALL BE A MED-CHI INSURANCE TRUST COMPOSED OF SIX TRUSTEES, AND IT SHALL HAVE THE POWERS AND DUTIES AS ARE PROVIDED FROM TIME TO TIME BY THE TRUST AGREEMENT AND ANY AMENDMENTS THERETO.

SECTION 2. TWO TRUSTEES OF THE MED-CHI INSURANCE TRUST SHALL BE APPOINTED BY THE PRESIDENT AS SOON AS PRACTICABLE AFTER THE ANNUAL SESSION EACH YEAR FOR A TERM OF THREE YEARS OR UNTIL THEIR SUCCESSORS ARE APPOINTED AND QUALIFIED. THE PRESIDENT SHALL PROMPTLY APPOINT A TRUSTEE TO FILL THE UNEXPIRED TERM IN THE EVENT OF ANY VACANCY AMONG THE TRUSTEES CAUSED BY RESIGNATION, DEATH, OR REMOVAL.

Explanation:The above bylaw changes regularize the action of the Council taken on September 9, 1965, in connection with the control of the "Med-Chi Insurance Trust," through appropriate procedures already established in precedent.

makes sleep irresistible

nidar®

EACH TABLET CONTAINS:

Pentobarbital Sodium	25 mg.
Secobarbital Sodium	25 mg.
Butabarbital Sodium	7.5 mg.
Phenobarbital	7.5 mg.

Chicago, Illinois, U.S.A.

nidar®

Sleep comes easy...lingers...departs naturally

Gentle doses of 4 barbiturates assure uninterrupted sleep

2 barbiturates act fast...in 20 to 30 minutes

2 long-range barbiturates come into play to sustain sleep for up to 8 hours

Tiny amounts of individual barbiturates means Nidar is well tolerated

Patients enjoy a refreshing, clear-headed wake-up

makes sleep irresistible

IN BRIEF:

EACH TABLET CONTAINS:

Pentobarbital Sodium	25 mg.
Secobarbital Sodium	25 mg.
Butabarbital Sodium	7.5 mg.
Phenobarbital	7.5 mg.

(WARNING: MAY BE HABIT FORMING)

Dosage: One or two tablets, one-half hour before bedtime.

Indications: For night-time sedation and refreshing sleep up to eight hours.

Contraindications: Patients sensitive to barbiturates. Use with caution in the presence of moderate to severe hepatic disease.

Supplied: Bottles of 100 tablets.

CAUTION: Federal law prohibits dispensing without a prescription.

ARMOUR PHARMACEUTICAL COMPANY
Chicago, Illinois, U.S.A.

To amend Article X, *Committees*, by inserting after Section 7 the following new Section 8 (succeeding sections to be automatically renumbered):

OLD

(No bylaw in existence)

NEW

(CAPS portion to be added)

SECTION 8. A FINANCE COMMITTEE TO ADVISE AND COUNSEL THE TREASURER REGARDING THE FACULTY'S FINANCIAL AND INVESTMENT PROGRAM SHALL BE COMPOSED OF THE TREASURER AND FOUR OTHER MEMBERS, ONE OF WHOM SHALL BE APPOINTED BY THE PRESIDENT EACH YEAR FOR A FOUR-YEAR TERM. THE PRESIDENT SHALL ANNUALLY DESIGNATE THE CHAIRMAN OF THE COMMITTEE.

Explanation: The above change reflects the instructions of the Council at its November 18, 1965, meeting and the request of the Treasurer and the Ad Hoc Finance Committee. This places into the Bylaws and the Faculty's organizational structure, the Finance Committee which is now functioning.

In addition to the above amendments, the Bylaws Committee considered the suggestion of the Frederick County Medical Society that the Bylaws provide for a referendum if requested by a petition signed by 10% of the active members being carried out by a mailed secret ballot. The bylaws currently provide for a referendum in Article VI, Section 1(c), and it was the opinion of the Bylaws Committee that no further provision is required.

Respectfully submitted,
CHARLES F. O'DONNELL, M.D., chairman
EDMOND J. MCDONNELL, M.D.
M. MCKENDREE BOYER, M.D.
ALBERT E. GOLDSTEIN, M.D.*

*Deceased

CURATOR

Mr. President and Members of the House of Delegates:

The undersigned assumed this post in January, upon the death of Mason F. Lord, MD. I look forward to performing interesting and satisfying work on behalf of the Faculty.

The Council and Treasurer were able to double the usual sum for portrait restoration and appropriate $1,000 this year. This enabled us to restore some of our portraits which might have suffered irreparable damage if the work had been delayed.

During the past year we have added the following items to the Faculty's historical collection:

Medical instruments belonging to Dr. James B. Joyce, given by his daughter, Mrs. Frederick Weiss.

Two electrocautery machines, given by Mrs. C. Ruth Jones.

Portrait of Tristram Thomas, MD, given by University of Maryland Medical School through Dean William S. Stone.

Collection instruments belonging to Lewis H. Gundry, MD, given by his son, Lewis P. Gundry, MD.

Instruments and diploma of Samuel J. Fort, MD, given by his son, Wetherbee Fort, MD

Old diplomas and pictures belonging to James Clagett Robertson, MD, given by his son, Lt. James Robertson.

Photographs of Drs. Koontz, Cullen, etc., and books for library, given by Harvey B. Stone, MD.

On June 17, 1966, Council acknowledged appreciation for bound volume of his collected papers given to library.

We thank these members and non-members who have assisted us in making the Faculty a repository of valuable historical material pertaining to medicine.

During the past year we loaned the Archer Diploma, the first medical school diploma ever issued in the United States, to the University of Pennsylvania on the occasion of its bicentennial celebration. We also loaned several items of historical interest to the Sinai Hospital for its anniversary celebration and other material to the American Association of Abdominal Surgeons.

Respectfully submitted,
E. DAVID WEINBERG, MD, curator

DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION

Mr. President and Members of the House of Delegates:

SPECIAL CONVENTION, OCT 3, 1965

Legislation and Public Relations

In a special session, convened in Chicago on October 3, the report of the Reference Committee on Legislation and Public Relations was amended and adopted as follows:

Mr. Speaker and Members of the House of Delegates:

Your Reference Committee recognizes the serious nature of the problems before this body and the decisions that must be made on this day—decisions which will affect the future of the practice of medicine for generations to come.

Your Committee heard 125 witnesses speak to twenty separate subjects during seven and one-half hours of testimony. Each witness spoke earnestly, forcefully, temperately, and with personal concern for the welfare of the patient in these United States.

Because of the special nature of the subjects presented to this Special Convention and the interrelationship of the resolutions considered, your Reference Committee, in lieu of dealing with each resolution separately, has considered the intent and the language of all the resolutions. We believe it would be more expedient and practical to present for adoption by this House of Delegates a series of numbered comments, principles and policies which express the position of the American Medical Association on the issues under consideration.

Mr. Speaker, we have endeavored to evaluate, carefully and objectively, the matters before your Committee, and offer the following recommendations:

I. Physician-Patient Relationship

Public Law 89-97 affects the legal, traditional, and ethical concepts of the physician-patient relationship.

Legal counsel for the American Medical Association has stated that an individual physician acting independently and not in concert with others can lawfully refuse to accept any person as a patient who is a beneficiary under the program, or he may elect to treat such persons.

Accepted for information

In response to a request for an opinion by the Speaker, the Judicial Council, on October 1, 1965, rendered the following opinion:

The *Principles of Medical Ethics* are applicable to physicians when they engage in group action as well as when they act individually. Section 4 calls upon physicians to observe all laws. Accordingly, medical organizations must be mindful of the possible consequences of the actions they propose, engage in or encourage.

Under ordinary circumstances, the individual physician acting independently, is ethically free to select his patients. (See Section 5 of the Principles.) (a) He may decline to render medical services to persons covered by the "Health Insurance for the Aged Act." (b) He may choose to treat such persons without charge. (c) He may treat patients with the advance understanding that he will look to them exclusively for payment and that he will or will not in any way help them in obtaining reimbursement for the cost of his services or the cost of associated services.

However, under some circumstances, the physician's freedom to select his patients may be circumscribed by overriding ethical considerations. For example:

1. A physician should respond to any request for his assistance in an emergency.
2. Once having undertaken a case, the physician should not neglect the patient, nor should he withdraw from the case without giving notice sufficient to allow the patient to obtain another physician.
3. If a physician decides not to participate in the Medicare program or decides to limit his participation, he should so advise the patient in advance of treatment. This applies to services rendered by the physician as well as hospital services and other benefits provided under the program.
4. As provided in Section 1 of the *Principles of Medical Ethics,* a physician should not refuse to render medical services to any person if as a result such person will be unable to get necessary medical care.

It should be noted also that Section 6 of the Principles provides that "A physician should not dispose of his services under terms or conditions which tend to interfere with or impair the free and complete exercise of his medical judgment and skill or tend to cause the deterioration of the quality of medical care." If after regulations are promulgated and the Medicare law becomes effective, the individual physician acting independently and not in concert with others, finds it does tend to impair the free and complete exercise of his medical judgment and skill or to cause a deterioration of the quality of medical care, the individual physician would be justified under this Principle in not participating under the law. The physician is ordinarily free to select his patients, subject to such ethical limitations as previously stated in Section 6 of the *Principles of Medical Ethics,* the Bauer Amendment, and in keeping with the nine principles for standards of health care programs adopted at the annual meeting 1965.

Accepted for information

In accepting the Judicial Council's opinion, as reported by the Reference Committee, the House called attention to the fact that this opinion should be read together with the Bauer Amendment (A-1961) and the nine principles for standards of health care programs adopted A-1965; and that these two items be distributed with the Judicial Council's opinion on the ethics involved in physician participation or nonparticipation in the Health Insurance for the Aged Act.

Mr. Speaker, your Reference Committee believes that it is desirable for this House to adopt a statement of policy regarding the traditional physician-patient relationship as it relates to Public Law 89-97. Mr. Speaker, we recommend that the following statement be adopted:

The American Medical Association opposes any program of dictation, interference, or coercion, whether direct or indirect, affecting the freedom of choice of the physician to determine for himself the extent and manner of participation or financial arrangement under which he shall provide medical care to patients under Public Law 89-97.

Adopted as Amended

II. Regulations Under Public Law 89-97

It was clear from the testimony received by your Reference Committee that the medical profession has a vital interest in the regulations which are to be promulgated under Public Law 89-97. Hastily drawn, unrealistic regulations could aggravate even further the undesirable effects of this law. Mr. Speaker, we recommend the adoption of the following statement as the present position and policy of the American Medical Association:

(a) The American Medical Association shall continue to meet with representatives of agencies and departments of the Federal Government, to participate in such advisory committees which are created, and to contribute whatever advice and suggestions are deemed advisable and necessary in the formulation and revision of regulations which will help it achieve Medicine's objectives on behalf of the public and the profession.

(b) The American Medical Association urges every physician, regardless of the extent of his involvement, to render whatever advice and assistance he can so that regulatory changes and/or legislative modifications may be suggested or sponsored by the American Medical Association in order that the best interests of the public and the profession may be protected in the provision of medical care.

(c) This House of Delegates expresses confidence in the Board of Trustees of the American Medical Association, its Advisory Committee, and the three-man Consultant Committee on Public Law 89-97 for their continuing efforts to secure regulations which are in the best interests of good patient care.

Adopted as Amended

* * * * * * *

Mr. Speaker, your Reference Committee next considered a number of items related to the primary subjects under consideration:

III. Certification by Physicians

Your Reference Committee recommends the adoption of the following statement of policy:

Current practices and customary procedures with respect to certification for hospital admission and care shall be continued under Public Law 89-97. The AMA Advisory Committee and the Association representatives to the technical advisory committees are advised to seek to accomplish this objective.

Adopted

IV. Blue Shield as Intermediary

Regulations yet to be promulgated will identify the nature of intermediaries under Public Law 89-97. Your Committee offers the following statement:

Blue Shield has, in many areas, demonstrated its ability to provide a competent insurance program. However, the AMA should leave to the state or appropriate local medical society, as the case may be, the expression of any preference for selection of a carrier.

Adopted

V. Reasonable Fees

Concern was expressed with respect to possible disputes between physicians and carriers relative to reasonable fees under the provisions of Public Law 89-97. We recommend the following statement of policy:

In the event of a dispute between physicians and carriers with respect to reasonable, customary, or usual fees, such disputes shall be resolved with the participation of the appropriate local medical society.

Adopted

VI. Utilization Review

Differences of opinion as to the purpose of utilization review committees were expressed. However, there was general agreement that with respect to the composition of such committees, the limitation of membership to include only physicians is preferred.

Accordingly, we recommend the following statement to the House:

Hospital utilization review committees shall be composed of practicing physicians.

Adopted as Amended

Your Reference Committee understands that the Council on Medical Service will conduct a conference on the subject of utilization review committees on November 27 in Philadelphia. Recognizing the importance of this subject matter, your Reference Committee recommends that Resolutions No. 8, 18, and 35 be referred to the Council on Medical Service with instructions that the Association's Advisory Committee as well as the Board of Trustees and the House of Delegates be kept informed of developments in this area.

Adopted

VII. Compensation for Medical Services

Your Reference Committee believes that the physician should be informed fully as to the merits and limitations of billing patients directly for services, or accepting an assignment to enable payment by a federally designated fiscal intermediary, so that the physician can decide for himself in each instance the method of compensation which he prefers. We recommend that the Association take appropriate action to inform physicians regarding the options of payment for services available to them under the law and its regulations.

Adopted as Amended

VIII. Shortage of Hospital Beds

The Oregon Delegation requested a survey of the probable shortage of hospital and related facility accommodations which may occur as a result of the implementation of Public Law 89-97 It also called for the development of a mechanism under which sufficient accommodations for the acutely ill, injured, or those in need of elective procedures will be reserved.

It is your Reference Committee's understanding that this subject is under active consideration by the Council on Medical Service. Your Committee accordingly recommends that this matter be referred to the Council for appropriate action.

Adopted

IX. Legal Opinion by AMA Counsel

Your Reference Committee was greatly impressed by the candid, forthright presentation by Mr. A. Leslie Hodson, legal counsel for the American Medical Association. We believe that his remarks should be made available to all constituent associations for their information and study. We believe that this will engender a better understanding of the legal limitations which face all medical organizations and the medical profession. Your Reference Committee recommends that the remarks of Mr. Hodson be distributed to the constituent associations.

The House instructed the Board of Trustees to implement this action at the earliest possible date.

X. Non-Discrimination Under Federally Assisted Health Care Programs

Witnesses testified that a number of state agencies require pledges of non-discrimination for the ostensible purpose of meeting the requirements of title VI of the Civil Rights Act. Comments received were justifiably bitter in view of the profession's record of non-discrimination in patient care.

Your Reference Committee has been informed that the Department of Health, Education, and Welfare has recognized the injustice of these state agency requirements and has recommended a substantial modification of this practice. Your Reference Committee believes that this matter should receive continuing surveillance.

Although the Reference Committee recommended that this subject be referred to the Board of Trustees for continuing study by the Association's Law Department, the House did not concur and, in response to a motion from the floor, adopted Resolution No. 1. (Resolution No. 1 attached.)

XI. Separation of Professional Fees and Hospital Charges

Mr. Speaker, we offer the following statement of policy for consideration by the House:

Hospital-based medical specialists are engaged in the practice of medicine. The fees for the services of such specialists should not be merged with hospital charges. The charges for the services of such specialists should be established, billed and collected by the medical specialist in the same manner as are the fees of other physicians. The American Medical Association intends to continue vigorously its efforts to prevent inclusion in the future of the professional services of any practicing physician in the hospital service portion of any health care legislation.

Adopted as Amended

Mr. Speaker, the policy statements herein presented to the House for its action are intended to respond to the specific problems placed before this Reference Committee. We are certain that more definitive statements on Public Law 89-97 will be adopted by this House as regulations are promulgated and as the program is implemented. But lest we be misunderstood, your Committee wishes to clearly emphasize that none of its recommendations should be construed as approval of Public Law 89-97, or in any way as acceptance of its philosophy.

Dr. James Z. Appel, in his remarks as President, told of his awareness of the problems before us. Dr. Appel spoke in his own behalf, but his comments reflect your Committee's feelings as well.

We congratulate him on his statesmanlike presentation, and we commend to each delegate the written transcript of his remarks.

Dr. Appel reminded us that, "Ours is a profession which must remain unified." "Ours is a profession which *must* remain unified," echoed many a speaker before your Reference Committee. These expressions of unity were voiced time and time again.

How shall we best maintain unity?

The Board of Trustees, in its report to this House, detailed in chronological order its efforts and experiences since the Annual Convention in June 1965. Your Committee heard many witnesses testify to the good work of the Board, to its devotion, and to its strength during these difficult times. To these unanimous expressions of confidence, your Committee adds its own. But we would not stop here. The leadership of the American Medical Association has been tested under fire. In difficult and crucial times, our officers and the Board have responded to legislative crises with courage and conviction. Years of withstanding the onslaught of the Medicare proponents did not weaken or lessen the determination of our officials.

The enactment of Public Law 89-97 would have come long before were it not for the leadership of our Board and Officers.

Nor should we fail to gratefully acknowledge the dedication, the inexhaustible effort, and the guidance provided by Dr. Blasingame and Dr. Howard, our Executive and Assistant Executive Vice Presidents.

We believe that the members of this House of Delegates would profit from a current report of the Association affairs, its programs, facilities, and personnel. Mr. Speaker, your Reference Committee recommends that Dr. Blasingame be invited to make such a presentation at the Clinical Meeting in Philadelphia.

Adopted

Mr. Speaker, before closing this report, your Committee would acknowledge some additional testimony received during the course of its hearing. Some speakers complained of inadequate knowledge of the activities of the Board, Councils and Committees of the Association. We believe that wherever the fault may be found, it must be shared by many. Undoubtedly, the Association should strive to continue to improve all means of communication available to it so that each physician member will be kept well informed on important matters. But each physician must be willing to receive the information beamed his way—through news releases, the weekly *AMA News*, and other AMA journals, publications, and communications. Finally, some of the fault must be shared by those state societies, or local medical societies, who at times receive the news from the AMA but fail to relay it to their members.

In Resolution No. 3 and in other remarks of witnesses, the Board and the House of Delegates were asked to consider the need for long-range planning. Your Committee believes that planning for the future should be an integral part of the activities of each AMA Council and Committee, as well as of the

Board. While we realize that planning is a continuing and ongoing program in the AMA, we would urge that the Board of Trustees take steps to assure that efforts in this regard be stressed even more by the Councils and Committees. Society is in constant flux and the American Medical Association must be prepared to meet the challenge of our times.

In still other remarks, the need for active physician participation in political activity remains clear. Your Reference Committee recommends that the House urge constituent medical societies and physicians to support and assist AMPAC and local medical political action committees in their efforts to elect candidates to office who will help preserve the physician's right to the free and independent practice of medicine.

In conclusion, Mr. Speaker, the members of your Reference Committee have been privileged to act in the capacity assigned to them. We know that in these trying times, the physicians of America will stand together and serve together in the best interests of their patients.

As a point of personal privilege, Mr. Speaker, I wish to express my gratitude to each member of the Committee for his patience, and for his diligent effort in discharging the monumental task assigned to him.

Submitted by:

George J. Lawrence, Jr., M.D., New York
George W. Petznick, M.D., Ohio
Harvey Renger, M.D., Texas
John M. Rumsey, M.D., California
B. E. Montgomery, M.D., Illinois, Chairman

* * * * * * *

OTHER HOUSE ACTION

The House recommended that tape recordings of Dr. Edward Annis' presentation before the National Orientation meeting held October 1, 1965, be made available to any member of the Association upon request at a cost basis (to be paid by person requesting tape).

BAUER AMENDMENT

ADOPTED—A-61

The House of Delegates of the American Medical Association records its opposition to any legislation of the King-Anderson type. Its opposition is based on the facts that such legislation does not meet the needs of the situation; interferes with the doctor-patient relationship; interferes with the rights of doctors employed in hospitals; is inordinately expensive; leads inevitably to further encroachments by government into medical care; results eventually in a deterioration of the type of medical care rendered the public; and is therefore detrimental to the public interest.

The House of Delegates invites attention to the fact that the medical profession is the only group which can render medical care under any system and that the medical profession is best qualified to determine how the best medical care can be delivered.

The House of Delegates believes that the medical profession will see to it that every person receives the best available medical care regardless of his ability to pay, and it further believes that the profession will render that care according to the system it believes is in the public interest and that it will not be a willing party to implementing any system which we believe to be detrimental to the public welfare.

NINE PRINCIPLES FOR STANDARDS OF HEALTH CARE PROGRAMS

ADOPTED—S-65

(1) No person needing health care shall be denied such care because of the inability to pay for it.
(2) It is appropriate that government revenues be used to finance health care when other resources have been found to be inadequate.
(3) Every level of government, municipal, county, state and federal, should assume a responsible share in the financing of such programs.
(4) The health care provided by such programs should be adequate and should be equal to that available to those who can afford to pay.
(5) Maximum use should be made of voluntary prepayment and insurance mechanisms.
(6) Administration of such program should be the responsibility of the state government. Participating states should be required to meet adequate standards of administration in order to qualify for federal funds.
(7) Eligibility requirements for benefits should be fair, realistic, uncomplicated and practical.
(8) Any such health care programs should provide funds only, and not direct services.
(9) Funds for such programs may come from general tax revenues and not from social security taxes.

AMERICAN MEDICAL ASSOCIATION
HOUSE OF DELEGATES

Introduced by: Ohio Delegation
Subject: Pledge of Non-Discrimination
Resolution: 1
(S/2-65)

Whereas, The Department of Health, Education and Welfare has attempted to force physicians treating patients under federally-assisted programs to sign pledges of non-discrimination; and

Whereas, Physicians, by subscribing to the Principles of Medical Ethics, willingly pledge to render service unconditionally to all patients with full respect for the dignity of man, providing for each a full measure of service and devotion, including in time of war the provision of medical care to the captured enemies of our country; and

Whereas, These conditions willingly self-imposed by the medical profession far exceed any pledge of this nature demanded by a Federal bureaucracy; therefore be it

Resolved, That all physicians are hereby informed that the refusal to sign such an oath does not flout the law; and be it further

Resolved, That the House of Delegates directs the Board of Trustees and the Officers of this Association to oppose actively and forcefully this and any future attempts by HEW or any other Federal agency to impose conditions and pledges upon the medical profession.

CLINICAL SESSION, NOV. 28-DEC. 1, 1965

As was to be expected, Public Law 89-97 (Medicare) was one of the most discussed items at the AMA's clinical session, held in Philadelphia from November 28 through December 1, 1965. While there were many resolutions introduced calling for some changes in the law presently on the books, the House did adopt a resolution commending Arthur Hess, head of the Social Security Administration's Bureau of Health Insurance for his "wholehearted cooperation" with the AMA's advisory and technical committees on Medicare.

James Z. Appel, AMA president, in his opening remarks to the House of Delegates, described medicine's efforts "to guide in the best possible direction the actions that government agencies are now taking to activate existing law (Medicare)." In reviewing the activities of the various technical and advisory committees, Dr. Appel stated: "Their suggestions have been received favorably in most instances, and we are hopeful that they will be translated into the final published regulations . . . (but) we know that in certain significant instances this will not be true." Dr. Appel's remarks have been published in full in the December 6, 1965, issue of the *AMA News*.

In other actions of importance, the House established:

"Usual and Customary" and Prevailing Fees

One of the most controversial issues before the House and the Reference Committee on Insurance and Medical Service was the "usual and customary" fee concept and

the prevailing fees program of the National Association of Blue Shield Plans (NABSP).

The House reaffirmed its support of the "usual and customary" fee concept as the basis for reimbursing physician participants in government programs at all levels of government. It also urged "the individual physician's usual and customary fee concept to all third parties."

It took this action after modifying a Board of Trustees' report on the new "prevailing fees" program of NABSP. The modified report recommended:

> That the concept of the prevailing fees program of the NABSP be noted as one of the methods of compensation in those regions where the prevailing fees program is approved by the local or state medical society.

In its report, the Board recalled a statement adopted by the House at the 1965 Annual Convention, which recommended that when government assumes financial responsibility for an individual's health care, reimbursement for professional services should be on the same basis as in the case of other indispensable elements of health care. "Therefore, reimbursement for the services of physicians participating in government-supported programs should be on the basis of 'usual and customary' fees," the statement said.

Abortion and Sterilization

Recommendations for the enactment of legislation to legalize abortion and sterilization under certain conditions were referred to the Board for further study. This action was taken after the House had received a report from the Board containing the recommendations of the Committee on Human Reproduction.

The House did suggest that the AMA can "render a distinct public service in this matter by conferring with other interested groups such as lawyers, clergy, sociologists, legislators, and government administrators."

It concurred in the reference committee's report that:

> It is not appropriate at this time for the AMA to recommend the enactment of legislation in this matter (abortion) for all states. The problem is essentially one for resolution by each state through action of its own legislature.

The report also stated:

> It is true that there are medical implications in such legislative decisions; physicians in each state should freely provide information and guidance on these medical implications. However, enacting laws to integrate the medical aspects with the moral, ethical, religious, economic, social tradition, and other aspects of the problem is clearly the exclusive prerogative and the responsibility of the legislature of each separate state.

In its report the committee said the problems of sterilization "appear subject to the same general considerations as the problems of abortion."

On the problem of contraception, the House reaffirmed its 1964 policy statement that:

> The prescription of child-spacing measures should be available to all patients who require them, consistent with their creed and mores, whether they obtain their medical care through private physicians or tax or community-supported health services.

It also endorsed a statement that:

> Appropriate legislation be enacted, wherever necessary, so that all physicians may legally give contraceptive information to their patients, consistent with the policy statement of December, 1964, and with the judgment and conscience of each individual physician.

Billing and Payment for Medical Services

Eight statements on fees charged by physicians for medical services were affirmed by the House. These are applicable "irrespective of whether such fees are paid by the patient, or paid or reimbursed in whole or in part under Public Law 89-97, or any other third party plan," the House stated. Here are the eight statements:

1. The intimate relationship between physician and patient is served best without the interposition of any third party carrier, whether in the area of diagnosis and treatment or the payment for these services.

2. It is the patient's responsibility to deal with third party carriers in the area of financial assistance provided that the physician is at all times mindful of his obligations to the patient under Section 1 of the Principles of Medical Ethics.

3. The physician-patient relationship is served best when there is an advance understanding regarding the payment of fees and the physician directly for services rendered. However, the physician is ethically free to choose in each case the manner in which he is to be compensated, based upon the exercise of his independent judgment.

4. The American Medical Association does not approve of any program which may directly or indirectly promote the charging of excessive fees or which interferes with the physician's right to charge fees commensurate with the services he renders.

5. The American Medical Association opposes any program of dictation, interference, or coercion, whether direct or indirect, affecting the freedom of choice of the physician to determine for himself the extent and manner of participation or financial arrangement under which he shall provide medical care to patients under Public Law 89-97, or other third-party plans.

6. It should be remembered that insurance does not create any new wealth. It merely assists in conservation. Insurance may conserve the ability of an insured person to fulfill his normal financial obligations. It does not enhance his ability to discharge added responsibilities if they are in the form of increased fees. To use insurance as an excuse to revise professional fees upward is but to contribute to the defeat of its purpose. If these indisputable and self-evident facts are not embraced by the entire membership of the profession, then it will have dealt irreparable harm to the whole movement. Also, any such failure might give impetus to whatever demand now exists for forcing rigid benefit schedules on the professional. (The foregoing is from a report of the Council on Medical Service to the House of Delegates at the Clinical Meeting in 1954).

7. The charging of an excessive fee is unethical and is contrary to Section 7 of the Principles of Medical Ethics. The physician's fee should be commensurate with the services rendered and the patient's ability to pay. (The foregoing is from a report of the Judicial Council which was approved by the House of Delegates at the Clinical Meeting in 1960).

8. It is not contrary to conscience for the physician to consider the patient's ability to pay if he fixes his particular fee within reasonable limits. In matters relating to fees, the physician should try, to the best of his ability, to insure justice to the patient and himself and respect for his profession. (The foregoing is from an opinion of the Judicial Council in 1958).

Gundersen Report

The House approved some of the many recommendations of the Committee to Review the Organization of the House (the Gundersen Committee), but it did not approve a number of others. Here are the House actions on some of the committee's recommendations:

Size of the House of Delegates.—Approved the suggestion that the growth of the AMA House be slowed down after it reaches 250 members. When it reaches that size, the apportionment ratio will be automatically raised from one delegate per 1,000 members, or fraction thereof, to one delegate per 1,250 members, or fraction thereof, in electing further delegates to represent each state association.

Reports of Councils and Committees.—Rejected the proposal that reports of the Council on Medical Service and Medical Education be transmitted through the Board of Trustees before being presented to the House.

Reference Committees.—Adopted the recommendation that there be three reference committees by name: Amendments to Constitution and Bylaws, Credentials, and Rules and Order of Business, and as many others be appointed "as may be required to consider the items of business before the House."

Tenure of Subcommittee Members of Standing Committee.—Approved a change in the Bylaws "to limit to specified terms of one to three years the tenure of members of special committees of the councils and committees of the House, with a limitation of 10 consecutive years of service."

Committee on Medical Practices.—Concurred in a recommendation that the Committee on Medical Practices be discharged with thanks and its responsibilities "be assigned by the Board to existing councils and committees."

Committee on Insurance and Prepayment Plans.—Rejected a plan to make this committee a council of the Board, and the committee was retained under the Council on Medical Service.

Tenure of Office of Trustees.—Turned down a proposal that would have affected the tenure of office of AMA trustees.

Affairs of Standing Committees.—Directed that a Bylaws change be prepared to remove the privilege of the Councils on Medical Service and on Medical Education of nominating to the Board the Secretary of the respective council. Also approved the suggestion that a vice chairman be elected by each standing committee of the House.

Resolutions to House.—Rejected the idea of a resolutions expediting committee and the recommendation that the deadline for resolutions be 10 days prior to the House meeting.

Federal Health Care Laws

The House took a number of actions with regard to federal health care laws passed in 1965, such as PL 89-97 (Medicare) and PL 89-239 (the Heart Disease, Cancer, and Stroke Amendments).

These actions included:

1) That the AMA immediately seek remedial action to delete the requirement in Public Law 89-97 that a patient be hospitalized to establish eligibility for nursing home care.

2) That the AMA immediately seek remedial action to amend Public Law 89-97, Part B, Title XVIII, by deleting the word "receipted," from Section 1842, Part 3, Item B, line (ii), and substituting "such payment will be made on the basis of a method of payment so arranged to preserve and continue the professions current practice of billing." Also approved "that the AMA recommend that the Department of Health, Education and Welfare establish that an agreement for payment between the patient and physician constitutes valid evidence of services rendered."

3) Authorized a study of the constitutionality of PL 89-97 by calling on the Board to "take such action as may be necessary and appropriate to provide for the study and investigation of all aspects of PL 98-97 for the purpose of determining possible court action to test the legality and constitutionality of any provision or regulation issued under the law," and authorized the Board to "initiate such legal proceedings as it may deem advisable to implement the purpose and intent of this resolution."

4) Endorsed the Council on Medical Services' recommendation "that the state and local medical societies be urged *at this time* to assume leadership in the establishment of local advisory committees" under the Heart Disease, Cancer, and Stroke amendments of 1965. The House noted that a National Advisory Council under PL 89-239 already has been appointed by federal officials and that the AMA was not given an opportunity to recommend possible appointees to the Council. "Therefore," the House declared, "active physician participation at the state and local levels is of utmost importance."

5) Urged HEW to "seek consultation with practicing physicians" in formulating regulations under Title XIX as has been done under Title XVIII of the Medicare law. It also instructed the AMA President and AMA Advisory Committee to HEW to "offer and urge such consultation."

6) Adopted a resolution that the Board:

> Continue to seek, through all appropriate means, the implementation and administration of federal medical and health programs other than those of the Armed Forces and Veterans' Administration by the Surgeon General of the Public Health Service, and especially those programs under Title XIX of PL 89-97.

7) Declared that the AMA Advisory Committee on PL 89-97 and 89-239 should persist in its efforts to achieve "practical recognition" by HEW of the differences between utilization review and claims review. The House adopted a report of the Council on Medical Service which said that "widespread confusion exists between the utilization review function and the claims review function." It also adopted a series of recommendations in the report aimed at clearing the confusion.

Other Important Actions

A study committee to evaluate planning techniques and development, which was established by the Board of Trustees, was concurred in by the House. The committee was given the tasks of 1) reviewing and studying current planning procedures in AMA, and 2) studying and recommending new mechanisms for organizational arrangements to achieve more effective planning and development in the future. Membership on the committee includes five Board members, the chairmen of the Councils on Medical Service, Medical Education, and Legislative Activities, the Speaker of the House, and two House members selected by the Speaker.

Disapproval was expressed by the House of portions of the Coggeshall report, "Planning for Medical Progress Through Education," published earlier this year by the Association of American Medical Colleges. The House opposed "the basic philosophy" of portions of the report, such as:

1) That the AAMC should "serve as spokesman for organizations concerned with education for health and medical sciences" and "no other organization is in a comparable position to bring together and express a comprehensive view."

2) That "the professional aspects of education for health and medical sciences should be regarded as an essential function and fully integrated component of university organization, with decreasing dependence upon or control by organized professions and their related associations."

A policy statement on federal aid to medical education was adopted by the House. It urges that 1) a major objective of the policies of the AMA should be to place the control of the full range of medical school functions in their institutional governing bodies, 2) action of the AMA should be designed to achieve this objective by proposal of appropriate legislation, and 3) the AMA should foster diverse sources of support for medical schools under circumstances that prevent any extramural source from exercising controlling influence.

The House approved a resolution aimed at responding immediately at the national and local levels to statements discrediting medicine. It directed the Board to provide for such response by the AMA and encouraged state and local medical societies to react similarly to statements appearing at the local level and concerning matters within the society's competence and knowledge.

There were scores of other actions by the House. Briefly here are some of them:

1) Defeated a proposal to set more stringent requirements for calling a special session of the House.

2) Approved a Bylaws change permitting recognition by affiliate AMA membership of physicians "who are members of the chartered national medical societies of foreign countries, to be approved and nominated by the Judicial Council" and members of the press who have served medicine well.

3) Approved a resolution calling for continued efforts, through "all appropriate channels," to achieve a separation of billing and payments for professional fees from hospital charges under insurance contracts written by the health insurance industry.

4) Urged the American Hospital Association to "assist the hospitals of the U. S. to establish a system of uniform cost accounting and billing."

5) Asked that all colleges and universities should have health education programs for their students.

6) Commended physicians in government service for "their support of the medical profession and their service to the public."

7) Agreed to a rewriting of two sections of a model agreement between hospitals and physicians providing professional services in hospital emergency departments to conform to principles established by the House.

8) Approved measures aimed at decreasing substantially the perinatal death rate through perinatal study committees in hospitals.

9) Requested state medical associations to act to assure that physicians are properly represented on state Hill-Burton hospital advisory councils.

10) Asked the Federal Aviation Agency to change its regulations so that any person applying for a pilot's license would be giving his implied consent to sobriety examinations by aviation officials.

11) Decided that AMA conventions should continue to open on Sunday and that the inauguration of the incoming president should be held on Tuesday evening of the Annual Convention.

12) Instructed the Council on Medical Service and its Committee on Welfare Services to develop for the AMA its definition and principles for the determination of medical indigency.

13) Accepted for information an opinion adopted jointly by the Council on Medical Service and the Judicial Council which states that:

> . . . when a physician assumes responsibility for the services rendered to a patient by a resident or an intern, the physician may ethically bill the patient for services which were performed under the physician's personal observation, direction and supervision.

14) Repeated a previous policy statement urging the creation of a separate post in the cabinet of the President of the United States for a Secretary of Health.

15) Commended past president Edward R. Annis, M.D., for his leadership, his dedication, and his tremendous contribution to medicine's campaign to preserve the world's finest system of medical care.

16) Elevated to status of Council the Committee on Environmental and Public Health.

As part of the session, contributions made by individual members of the profession to American Medical Education and Research Foundation were presented to the Foundation before the assembled members of the House. Maryland's contribution of $9,605 was made by Robert vanL. Campbell, M.D., senior delegate and president of the Faculty.

Respectfully submitted,

Robert vL. Campbell, M.D.
J. Sheldon Eastland, M.D.
Russell S. Fisher, M.D.
William B. Hagan, M.D., alternate

ECONOMICS COMMITTEE

Mr. President and Members of the House of Delegates:

During the past year, the Med-Chi Insurance Trust was established and approved by the House of Delegates in September, 1965. The program is well organized and underway, and we look forward to an effective increase in types of insurance offered to our members and to improvements in current insurance programs. Beginning in 1967, the Med-Chi Insurance Trust will make an annual report to the House.

The Health Insurance Review Subcommittee reviewed nine cases of fee disagreement between major medical insurance carriers and physicians. It is the responsibility of the subcommittee to ensure that such carriers are obligated to pay 80% of the customary fee for the same procedure as is usually charged in the community. Decisions of the subcommittee have fallen into a rough pattern of approximately 66⅔% in favor of the physicians.

U. S. Armed Forces Dependents Medical Care Program

Payments through Blue Shield and Blue Cross to physicians and hospitals in Maryland for care rendered to dependents of active duty military personnel totaled $733,922 during 1965. Of this amount, payments for physicians' services amounted to $301,059 and hospital payments were $432,863. These amounts compare with $314,158 and $458,353, respectively, in 1964.

During the year the Blue Shield Dependents Medical Care Section processed claims for 4,201 physicians' services. Table 1 shows the distribution of these claims by type of care.

TABLE 1
PAYMENTS TO PHYSICIANS

Type of Service	Number	Percentage	Amount	Percentage	Average Payment per Service
TOTAL	4,201	100.0	$301,058.60	100.0	$ 71.66
Obstetrical	1,584	37.7	191,308.19	63.5	120.77
Surgical	521	12.4	49,883.25	16.5	95.74
Medical	934	22.2	34,531.66	11.4	36.97
Other	1,162	27.7	25,335.50	8.6	21.80

Since the beginning of the program in 1956, maternity care has consistently accounted for the major segment of total care; this pattern was maintained in 1965 with expenditures for physicians' services. Obviously, the reason for this pattern is the much younger average age of those covered by the program. Surgery accounted for 16.5%, medical benefits for 11.4%, and miscellaneous other services (anesthesiology, radiology, etc.) comprised the remaining 9.6% of payments.

The Advisory Committee for the Dependents Medical Care Program, a group of physicians appointed by the Medical and Chirurgical Faculty as a subcommittee of the Economics Committee, continued to help in the administration of the program, although less demand had to be made on their time than in previous years. The committee acts as an adjudicating body in cases requiring professional judgment and advises the fiscal agent in matters pertaining to professional practice. During 1965 the committee met on two occasions and acted upon 27 specific cases referred to it at the request of individual physicians or the staff of the Maryland Blue Shield Plan, the fiscal agent. Table 2 shows the distribution of committee cases by type of care.

TABLE 2
DISTRIBUTION OF COMMITTEE CASES BY TYPE OF CARE

General surgery	9
Obstetrics and gynecology	8
Medical	3
Plastic surgery	2
Anesthesia	2
Pediatrics	2
Psychiatry	1

The hospitals of Maryland provided a total of 12,404 days of hospital care to the dependents of servicemen incidental to 2,281 admissions in 1965. The average length of stay per admission was 5.43 days and the average cost per case, $189.76.

During 1965 the Maryland Blue Shield Plan continued to act as fiscal agent for the Faculty in administering the Dependents Medical Care Program in Maryland. The Plan was reimbursed by the Federal government for claims paid and actual administrative costs in connection therewith.

COMMITTEE ON EMOTIONAL HEALTH

Mr. President and Members of the House of Delegates:

This committee has concentrated on three main areas: legislation, education of physicians in mental health, and inclusion of psychiatric services in general hospitals.

The Patient/Psychiatrist Privileged Communication bill, which was vetoed by the Governor in 1965, was again introduced in 1966. The Governor, in his veto message, indicated that if it were passed again by the Legislature and agreement were reached with the psychologists and lawyers, he would sign it into law. Minor concessions were made to the psychologists in the 1966 bill, but no agreement could be reached with the legal profession. The members of the committee have worked assiduously for the enactment of this much needed legislation, which is now being studied by the Senate Judiciary Committee.

The Community Mental Health Services Act, now being discussed by the Senate Finance Committee, is the result of collaboration and compromise among all interested groups. The committee believes that although this legislation is not written in its most desirable form, the idea it advances commands the support of the practicing physicians in Maryland. The fate of this act is still in doubt but is being watched carefully by this committee.

Some advances have been made by the Subcommittee on Education. Although definite dates have not been arranged, commitments have been received from two component societies for program presentations. Plans have also been made to produce two programs on the MEDIC network, one on June 3 and another in September. This progress is due mainly to the personal efforts of the previous subcommittee chairman, Anthony S. Garofano, MD, and his successor, Thurman Mott, Jr., MD, both of whom are to be congratulated for their successes and thanked for their endeavors.

Another area of effort has been the furthering of psychiatric services in general hospitals. A tour of the Prince George's General Hospital psychiatric unit was conducted for administrators of general hospitals throughout the state. This tour impressed on those attending that a general hospital can incorporate a psychiatric service without disturbing other areas of care. The Faculty Council, at the request of this committee, endorsed a statement which reads in part as follows: "The Medical and Chirurgical Faculty of the State of Maryland heartily supports the inclusion of psychiatric services, both inpatient and outpatient care, in all general hospitals in the State of Maryland." This lends authority to the activities of the committee and has been publicized in the *Maryland State Medical Journal.*

In order to promote this concept, the Education and Training Committee of the Advisory Council on Mental Hygiene has been requested to study plans for the inclusion of general hospital training in the educational programs of the state mental hospitals.

The Faculty, through this committee, cosponsored a Mental Health Planning Conference, held during the past year. This was well attended by both physicians and members of ancillary groups.

A member of the Faculty staff and the Chairman attended the 12th Annual Conference of State Mental Health Representatives in March, 1966. Since the sections of the country are so widely separated in their care and attitude toward mental health, it has been decided that more could be gained from having small regional meetings in the future rather than the national one. Maryland has been grouped with Delaware, New Jersey, New York, and Pennsylvania, at the request of this committee. Much can be learned from meetings with the mental health leaders in these states.

Although the committee has suffered several setbacks in its ambitions, encouraging advances have been made, too. It is the consensus of the committee that the basis for future success in several areas has been formed and will be of immeasurable value in the coming year.

Thurman Mott, Jr., MD
Richard H. Pembroke, Jr., MD
William J. Peeples, MD
Jonas R. Rappeport, MD
Kent E. Robinson, MD
Isadore Tuerk, MD

SUBCOMMITTEE ON EDUCATION: Thurman Mott, Jr., M.D.

FEE SCHEDULE COMMITTEE

Mr. President and Members of the House of Delegates:

After many hours of work on the part of the Fee Schedule Committee, a guide for the fee for service to semiprivate patients in the $7,500 or under income level was developed and presented to the Council in November, 1965. The Council formally adopted this in January, 1966, with the understanding that adjustments should be made when required by changing circumstances. Copies were mailed to all *active* members on March 4, 1966.

Many items are still pending before the committee. Questions must be answered or recommendations made to the Council on matters such as presenting this or another schedule to the Workmen's Compensation Commission for approval, development of a home and office service and procedure schedule, and working with the State Health Department in its program of payment of "usual and customary" fees for patients under the indigent and medically indigent care programs.

It should be emphasized that semiprivate fees for in-hospital services represent, in most instances, a reduction in the physicians' usual and customary fees and therefore should apply only when the patient is directly responsible for the fee or when services are rendered under an income limitation schedule.

Certain matters now under active discussion in the committee may require a supplemental verbal report to the House of Delegates, and it would be appreciated if this can be arranged at an appropriate time.

Respectfully submitted,

William G. Speed, III, MD, chairman
Katherine H. Borkovich, MD
Archie Robert Cohen, MD

William H. Mosberg, Jr., MD
William L. Stewart, MD

AD HOC FINANCE COMMITTEE

Mr. President and Members of the House of Delegates:

An Ad Hoc Committee on Finance was formed and charged with specific financial responsibilities after the 1965 Annual Meeting, upon recommendation of the previous treasurer. The Ad Hoc Committee was set up to see if there were sufficient matters to warrant appointment of a standing committee.

Since that time, the Ad Hoc Finance Committee has made a recommendation that it become permanent, and the Bylaws Committee has prepared Bylaw changes to accomplish this. They are presented in the Bylaws Committee report.

In June, 1965, the Council approved the following recommendations of this committee, and they have been working out satisfactorily:

1. Provide for regular reports to the Council on the financial status of Faculty finances, including designated funds. This would be done at the regular Council meetings.
2. Establish a separate payroll account on an imprest basis subject to a single signature, either the Executive Secretary or the Treasurer.
3. Amend signature procedures on the general fund checking account so that bills up to $500 may be paid over the signature of either the Executive Secretary or the Treasurer. It would be Faculty policy that any checks over $500 in value would be signed by the Treasurer only.
4. Approve deposit of all cash receipts to the Faculty's savings account where they would be invested in short-term investments maturing as the funds are needed for Faculty operations. Withdrawals from this savings account would be on the signature of the Treasurer only.
5. On a monthly basis checks would be drawn on the savings account, to be signed by the Treasurer only, replacing money used from the payroll imprest fund

and the general fund imprest account. A complete accounting of the funds spent during the month would accompany each withdrawal check.

6. Continue to evaluate the accounting and bookkeeping operations of the Faculty so as to simplify and modernize them as much as possible.

A supplemental verbal report may be made to the House of Delegates if data are available and on which the committee may formulate some conclusions.

Respectfully submitted,
KARL F. MECH, MD, chairman
WILLIAM A. PILLSBURY, MD
J. MORRIS REESE, MD
E. W. DITTO, JR., MD

LEGISLATIVE COMMITTEE

Mr. President and Members of the House of Delegates:

Your Legislative Committee held several meetings during the past year. We met once before the State Legislature convened and again during the session to outline our course of strategy. This procedure has worked extremely well. We have been assisted by many of our friends in allied health fields, and we are most grateful.

During the 1966 Legislative Assembly, 131 bills were introduced in the House and 53 bills in the Senate, all of which have some medical connotation. Careful scrutiny of these bills and watchfulness while they were pending in the various legislative committees has resulted in the passage of bills which are helpful to the public.

We find in our discussions in Annapolis that legislators are anxious and willing to receive advice from the profession. We believe that action on a component society level will assist both the profession and the legislators to become aware of the pitfalls that preparing and introducing health legislation can create. In every instance, suggestions offered by the Faculty's representatives in Annapolis for amendments to bills were accepted by either the sponsors or the committees in which hearings were held on such bills.

Major bills of consequence and their final status is as follows:

SENATE BILLS

Senate Bill 118.—This bill, introduced by the Maryland Psychiatric Association and other interested parties, was supported by the Faculty. It provided for "privilege" for psychologists and psychiatrists except in certain instances.

It had a stormy hearing in the Senate Judiciary Proceedings, was amended and reported out favorably with amendments to the Senate. It passed the House in the last legislative session day. It now awaits signature by the Governor. Last year, a similar bill was vetoed by the Governor, a fate that may happen again, though it is doubtful.

Senate Bill 143.—To permit the Board of Medical Examiners to suspend, as well as place on probation, the licenses of physicians who are called before the Board. The Board had only the power to revoke.

The bill was introduced through Faculty sponsorship and passed both houses without any changes. It awaits signature by the Governor.

Senate Bill 150.—To amend the battered child laws to require others who see children with this syndrome to report these cases to the local welfare department for investigation; to provide civil immunity for those making such reports; and to set up a central registry for such cases in the State Department of Social Welfare.

This bill was introduced through sponsorship of the Faculty and other interested groups. It passed both houses without any substantial change and awaits signature by the Governor.

Senate Bill 270.—To provide for an increase in the amounts paid medical examiners by local governments. This bill was supported by the Faculty and passed both houses without difficulty. It awaits signature by the Governor.

Other bills in which the Faculty was interested include:

Senate Bill 46.—To provide for a change in the insurance laws making it unnecessary for individuals to report possible lawsuits for alleged negligence. This passed.

Senate Bill 60.—Implied consent laws. After amendment in the Senate and further amendment in the House, it failed in conference committee and is dead until the next legislative session.

Senate Bill 61.—Making abortions in cases of rape and carnal knowledge legal, provided the local state's attorney certifies as to the authenticity of the case. This passed.

Senate Bill 325.—Requiring state agencies and other local government agencies to accept reports of optometrists in any matters with which they are concerned and within the scope of the practice of optometry. This passed both houses and awaits signature by the Governor. An attempt is being made to have a hearing befor the Governor in the hopes that this undesirable legislation can be vetoed.

HOUSE BILLS

The Faculty had no specific interest in introduction of various bills in the House except in the manner in which they might affect the health of Marylanders. A partial summary of bills and the Faculty's stand follows:

House Bill 277.—This would have required physicians to provide a certificate or statement to patients that they are unable to drive a motor vehicle, if the physician so thought. Such statements or certificates would have to be sent in with every third renewal for patients over 40; every other renewal for patients over 50; and every renewal for patients over 60. The Faculty opposed this and suggested instead a partial list of diseases or conditions which would be automatically reportable by physicians when patients presented themselves for care.

Neither of these bills was adopted, and this matter continues under study for some type of legislative suggestion in 1967.

House Bill 269.—To provide for license suspension for individuals driving while under the influence of barbiturates and/or amphetamines, as well as alcohol and narcotics. This bill passed.

House Bill 327.—To permit addicts to be released to an authorized aftercare program rather than being sentenced

to prison. The Faculty supported this proposal, and it was enacted into law.

House Bill 328.—To increase the penalties and amend the law to make it a crime to have possession of barbiturate and/or amphetamines except in the normal course of business, occupation, profession, etc. There was no exception in the original bill, but conference with the sponsors added the exemption noted. This bill passed.

House Bill 361.—This bill increased the size of the Board of Physical Therapy to add two physical therapists to the current Board of five physicians. All persons will be named by the Governor from lists submitted by the Faculty. The Faculty supported this bill, and it was enacted.

House Bill 487.—Known as the osteopathy bill, this would have given osteopaths full rights and privileges to practice allopathic medicine. The Faculty waged an all-out fight to ensure that it was killed in the House Ways and Means Committee, and the bill was defeated by a 30-5 vote.

House Bill 544.—This was a Humane Society proposal requiring record keeping and licensing and inspection of animal facilities. It did not exempt research laboratories. It passed the House but was held in the Senate committee.

House Bill 675.—This Health Department proposal ran into difficulties after it passed the House with an amendment. The original bill required the Health Department to establish minimum rules and requirements for laboratories and issue permits for them. The Faculty sponsored amendments that would require out-of-state laboratories to meet the same requirements as laboratories in Maryland and would prohibit solicitation or advertising by all such laboratories.

With deadline for adjournment of the General Assembly, the Senate Judicial Proceedings Committee amended the House-passed version and, at the last session of the House, the amendments were concurred in and the amended bill was enacted.

House Bill 1010.—This bill would have required all insurance carriers to offer policies which included payment for chiropractic services. The decision to accept or reject would be with the public. This bill passed the House but died in the Senate Insurance and Banking Committee.

A complete listing and breakdown of all bills with which the profession is concerned can be found in *The Assemblyman,* published during the legislative session.

Federal Legislation

With the passage of Medicare legislation, PL 89-97, in the summer of 1965, legislative attention on a federal level was turned to such items as animal care facilities, Hart Bill (making it illegal for a physician to dispense drugs, eyeglasses, etc.), and other similar items.

During the early part of 1966, the committee met with other health groups and representatives of Congress. Congressmen Friedel and Fallon both joined the meeting in person. An enjoyable evening was spent in becoming better acquainted with our representatives in Washington.

The first objective of our meeting was to acquaint them with the assistance that the physicians, dentists, nurses, hospital representatives, and others can be to them in many ways, not only in helping them to answer their constituents' queries but also in helping them with any problems of medical import. We believe these meetings are fruitful and plan to continue them at least once a year.

Our thanks go to all those individual members who assisted us in contacting their delegates or senators. Without their help, our work could not have been accomplished as successfully as it was.

Respectfully submitted,

LIAISON COMMITTEE

Mr. President and Members of the House of Delegates:

The entire committee met three times during the past year, and its subcommittees met at various times.

The Liaison Committee, through its Subcommittee on Nursing, has recommended certain policies which have been endorsed by the Council and Executive Committee. These policies related to the following: 1) protocol on registered nurse responsibilities in relation to the Medical Practice Act; 2) closed chest resuscitation and artificial respiration by the registered nurse; 3) intravenous administration of fluids, blood, medications by registered professional nurses practicing in Maryland. Copies of these policies are available through the Faculty office.

Pharmacy Liaison Subcommittee—This subcommittee has continued to cooperate with representatives of the Maryland Pharmaceutical Society and has provided speakers for its annual meeting. Plans are underway for a proposed code of cooperation with the pharmacists and for a series of articles dealing with pharmacy and medicine.

Another item of business, although no conclusions were reached, is that of volume discounts offered by drug manufacturers to the State Health Department for prescriptions written by physicians under the Medical Care program. Such discounts would be paid directly to the state and would be based on the total volume of drugs used in state agencies during any given year.

The chairman met with the secretary of the Maryland State Board of Pharmacy Examiners to clarify certain areas in connection with the "Protocol on Registered Nurses Responsibilities in Relation to the Medical Practice Act." These points were amicably settled, and the Maryland Nurses Association advised accordingly.

Other Matters—The committee, through Edgar P. Williamson, III, M.D., has maintained continuous contact with various state agencies to let them know that the Faculty is available to assist in any areas it can. The State Education Department has asked for assistance in revising its bus drivers' physical examination form, and discussions will be continued in this area.

The State Health Department, in response to a query, advised that x-rays are not provided to any "special interest" groups. The committee approved suggested PKU rules and regulations, approved a proposed policy with respect to examinations being performed by State Health Department laboratories, developed a new communicable disease reporting form in cooperation with the Health Department's Division of Epidemiology, learned that tonometry testing by optometrists, using the scleral tonometry procedure is within the scope of the optometry law, and approved a recommendation of the Community Hospital Liaison Subcommittee that it be disbanded and reactivated later if necessary.

Pending items—Items still pending in the committee include liaison with the Health Department in connection with PL 89-239 (Heart Disease, Cancer and Stroke) and PL 89-97 (Medicare), as well as development of a compendium of rules and regulations with which physicians must comply.

Respectfully submitted,

John F. Schaefer, M.D., chairman

LIBRARY AND HISTORY COMMITTEE
FINNEY FUND COMMITTEE

Mr. President and Members of the House of Delegates:

In 1965 the library reinstated visits to county society meetings whenever possible. By this means, the library personnel can become aware of the actual needs of members outside the Baltimore area. At the same time, these Faculty members have a chance to examine a sampling of the new books in the library and to discuss their needs for new subject materials and request titles not in their own libraries. Three such visits were made last fall, and more are scheduled this year.

New shelving was added in the reading room, and a new 72-drawer walnut catalog case supplements the outgrown cabinets already in use. New chairs replaced some of the damaged older chairs in the reading room. An order desk was bought for the office, and a new conserva-file cabinet contains the vertical file materials. With a fresh paint job in the spring, the library quarters will show considerable improvement.

The sale of duplicate sets of *Index Medicus* and *The Quarterly Cumulative Index of Medicine* brought $1875, which will be applied to library expenses.

During the year, Mrs. Sanford attended an advisory group meeting on Information Needs of the Practicing Physician, called by the Scientific Activities Section, AMA, in Chicago, May 10, 1965. This seminar was planned by Mrs. Susan Crawford, director of the Archive-Library Department, and was attended by representatives from the National Library of Medicine, several outstanding university libraries, the president of the Medical Library Association, and eight medical society librarians. Its purpose was to determine exactly what the physician wants from his own professional library.

Both Mrs. Sanford and Mrs. Miller attended the Medical Library Association meeting in Philadelphia, where they participated in continuing education courses in library techniques and visited several Philadelphia libraries, particularly that of the American College of Physicians and the rare book collection at the Free Library of Philadelphia. Special Libraries Association met later in Philadelphia and was attended by Mrs. Sanford.

In October the Medical Library Association held a regional meeting in Charlottesville, Va, to discuss "Upgrading the Rundown Medical Library." This group will meet in Baltimore next fall with Welch Library as host. Our library will cooperate with arrangements.

In November our library was host to the Baltimore Hospital Librarians Association. Louis Krause, MD, was speaker. Mr. Alfred Brandon, president of the Medical Library Association, also spoke briefly about the Medical Library Assistance Act of 1965.

Library exhibits were present at the annual and semiannual meetings of the Faculty, with a librarian in attendance.

Some progress was made in rearranging the basement collection, but this project is not completed. Securing part-time library assistants to complete this project is a problem. About half of the collection which has been housed in the corridor has been moved to the enclosed stacks, where the volumes will be better protected from dust. These titles are being interfiled with titles in the main basement stacks. Corridor shelves will eventually be used for a duplicate collection of journals.

Requests for bibliographies have steadily increased. These are often excessively time consuming, even though the librarians try to maintain a tentative time limit and scope within the potential of the small professional staff. Statistics show only the bibliographies which are actually typed and entered into the bibliography file. Many shorter searches are accomplished which do not appear in this figure.

Interlibrary loans constitute a great part of the library activity, both charged out to other libraries and borrowed by this library. The Medical and Chirurgical Faculty Library borrowed 329 items from the National Library of Medicine and other libraries in 1965.

No memorial gifts were received during 1965.

The Rare Book Room situation remains the same as in 1964, there being no other available space for it.

The following statistics for 1965 show a healthy increase over the 1964 statistics:

Circulation	
Journals	3905
Books	1784
Total	5,689
Attendance	3,091
Courtesy cards issued	15
Bibliographies	188
Additions	
Bound journals added	507
Books added	391
Total	898
Total volumes	92,332
Gifts	
Journals	1,065
Books	82
Pamphlets, pictures, reprints, etc.	100
Total	1,247

MARYLAND JOINT COUNCIL TO IMPROVE THE HEALTH CARE OF THE AGED

Mr. President and Members of the House of Delegates:

This organization was dissolved in June, 1965, and the money remaining in the bank balance has been prorated among the participating organizations.

Respectfully submitted,
Albert E. Goldstein, MD*
C. Rodney Layton, MD
John W. Clark, DDS, MD

*Deceased

MARYLAND MEDICAL SERVICE BOARD OF TRUSTEES

Mr. President and Members of the House of Delegates:

In the past year Maryland Blue Shield set new records in enrollment, in benefits provided, and in operating efficiency.

More than 47,600 new members were enrolled during the year, bringing total membership under all types of certificates to 889,572 as of December 31, 1965. The gain of 5.7% in membership was more than twice the national average and reflects both the public's confidence in Maryland Blue Shield and the effectiveness of its sales efforts. Enrollment in Blue Cross increased by about 35,000 during the year, bringing the total to 1,188,204. At the end of the year Blue Shield enrollment was 75% that of Blue Cross, as compared with 72% the year before.

At the year's end, 83% of Blue Shield members were enrolled through groups, the remaining 17% being direct payment (billed-at-home) members. Of total group membership, 74.4% were enrolled under special contracts, with employers contributing a substantial amount toward the cost.

Plan B enrollment (including the "High Option" Federal Employees) stood at 484,747 at the end of the year (it was 415,626 a year ago) and accounted for 63.6% of all enrollment, exclusive of the special Steel program. Membership under the special Steel contracts was 126,966 as of December 31. Continuing the shifting from Plan A to Plan B, which has been typical over the past several years, Plan A membership decreased to 277,859 from the 296,742 of a year ago.

Benefits provided to its members by Blue Shield for physicians' care rose to a record $15,666,826 in 1965, an increase of more than $2 million over the preceding year. The 1965 payments, representing 381,527 separate professional services, brought the amount paid for physicians' care to more than $98,000,000 since the Plan's founding in 1950.

Benefits were received by 241,464 members in 1965, almost 33,000 more than the year before. Included in the 381,527 claims covered during 1965 were 183,947 surgical services, 43,977 medical cases, 10,852 consultations, 13,540 obstetrical benefits, 50,513 anesthesia administrations, 53,101 radiological examinations or treatments, and 25,597 pathologic and other types of services.

Recognizing the value of early detection of disease, Blue Shield, in conjunction with Blue Cross, several years also began making benefits available for diagnostic services at physicians' office or hospital outpatient departments. By the end of 1965, more than 370,000 members had coverage for services of this nature, and more than 43,000 individual examinations were covered during the past year.

Maryland Medical Service continued to act as the fiscal intermediary for the Faculty and the Office of Dependents' Medical Care in 1965. Payments of $301,124 were made to Maryland physicians for their services to the dependents of active duty military personnel under this program, representing 4,201 claims for professional services.

During the year the Plan continued to give increasing attention to improving the effectiveness of its day-to-day working relationships with physicians. At year's end 3,338 physicians were formally participating in Maryland Blue Shield, representing 93% of those physicians who provided services to the Plan's members during the year. In 1965, representatives of the Plan's Physicians Relations Section made more than 2,500 personal visits to physicians' offices, discussing various aspects of Blue Shield operations with physicians and their office assistants.

I appreciate the time and effort given so unstintingly by the members of the Blue Shield Board of Trustees, both lay and physician, and the members of the Reference and Appeals and Medical Relations Committees.

Respectfully submitted,
J. Sheldon Eastland, MD, President,
Maryland Medical Service, Inc.

MARYLAND STATE MEDICAL JOURNAL

Mr. President and Members of the House of Delegates:

The financial report for 1965 is as follows:

Cash income received from Journal advertising, subscriptions, and other sources ..	$70,142.05
Cost of publishing Journal, including salaries, etc., (exclusive of light, heat, office space)	$82,321.39
Expenses over income	$12,174.34

The figure shown is not a true deficit, however, as the cost of publishing the transactions of the House of Delegates and the Membership Directory are charged to the Journal. In addition, the Journal office turned over to the library nearly $1,000 worth of books sent for review.

Most of the costs of Journal publication are met by advertising revenue. Several years ago the volume of advertising dropped sharply, then began to pick up gradually. Toward the end of 1965 and early in 1966 the advertising picture became much more encouraging. A number of new pharmaceutical firms have begun advertising in our Journal, and many former advertisers have resumed advertising. Four-color advertising has been introduced in our Journal this year.

Over the past few years a tremendous backlog of manuscripts has accumulated, and many authors have been displeased with the long delay between submission of a manuscript and its publication. The delay has been as much as two years. We try to maintain a ratio of approximately 50% editorial matter and 50% advertising. With the recent increase in the number of advertising pages, we are slowly shortening the time lag; but it is still longer than ideal.

Respectfully submitted,
George H. Yeager, M.D., Editor
Doris E. Fletcher, Managing Editor
Editorial Board
Henry P. Laughlin, M.D.
Louis R. Schoolman, M.D.
E. T. Lisansky, M.D.
Edward C. H. Schmidt, M. D.
Houston S. Everett, M.D.
Leon W. Berube, M.D.

MEDIATION COMMITTEE

Mr. President and Members of the House of Delegates:

During the year the Mediation Committee heard many grievances and acted as adjudicator in cases involving unethical acts on the part of physicians, particularly those that were brought to the attention of the Committee. These were in addition to cases handled by component societies, a summary of which is part of this report.

Cases involving court convictions are not acted upon until the Board of Medical Examiners has heard the case and determined its course of action. The Mediation Committee is then guided by the Board's decision.

Most of the cases brought before the committee are not serious enough to warrant court trial and possible conviction. They involve unethical matters which are sometimes hard to define. The committee often finds its hands are tied because the only disciplinary actions it can take are to censure, reprimand, place on probation, or expel from the Society. On the recommendation of the Policy and Planning Committee, a special committee is now studying this matter and, hopefully, can suggest some more adequate disciplinary procedures to be invested in both the Society and the Board of Medical Examiners.

During the year, the Mediation Committee:

1. Found that the program as presented by the Baltimore Regional Joint Board, Amalgamated Clothing Workers of America, Health and Welfare Fund, was not unethical. The decision to participate would rest with the individual physician.
2. Found that some physicians were engaging in unethical conduct by acting as "fronts" or "heads" of lay laboratory operations and not actually supervising or performing any work done by such groups.
3. Discussed with some physicians their alleged falsification and/or illegal submission of Blue Shield claim forms.
4. Reaffirmed the policy that physicians could not submit claims to Blue Shield for work not "personally and actually" rendered by them.
5. Directed a physician to cease engaging in fee-splitting, to which he pleaded guilty.
6. Censured a physician for accepting fees on a contingency basis and for perjuring himself in court.
7. Rendered a decision that it would be unethical for a physician to incorporate any portion of his medical practice as separate and distinct from his professional services.
8. Voted to bring to the attention of the District Medical Society the fact that a physician member of that group was permitting his name to be used in solicitation for laboratory work by a firm operating from Virginia.
9. Did a survey of all lay laboratories in the state to ascertain what role physicians played in operation of such laboratories. It was learned that five of these associations were ethical, five were unethical and the physicians were advised to cease their activity with such operations.
10. Surveyed the few physicians that owned pharmacies in violation of the recently enacted law prohibiting such physician ownership and ascertained that these were legal in view of the grandfather clause in the law.

MEDICAL ADVISORY COMMITTEE OF THE RED CROSS BLOOD BANK PROGRAM

Mr. President and Members of the House of Delegates:

The Baltimore Regional Blood Program of the American Red Cross operates as one of 56 blood centers throughout the country under the United States License No. 190 of the National Institutes of Health. It is a national voluntary blood donor service which produces one half of the blood used in the United States. The Baltimore program was established in December, 1958, to supplement the collections of the 32 hospital blood banks operating in the Baltimore area. The Red Cross now provides more than 40% of the whole blood used by these hospitals. In addition, the program is rapidly approaching a total supply of certain important blood derivatives.

The Baltimore Regional Chapter Program is and has been the largest single program in the Baltimore area and is the community's most significant voluntary donor program. It contributes more than any agency or group of agencies toward an adequate community supply of blood. There has been a gradual increase each year; last year the Red Cross collected and distributed 1,153 more pints than the previous year.

More than 800,000 individuals are protected by the Baltimore Regional Program, and this number continues to grow. Both group and individual plans of coverage are offered, making it possible for anyone in the community to participate and receive protection. The Red Cross has concentrated its efforts on the group donor coverage with only limited emphasis on the individual coverage. At the present time the total blood needs of the Baltimore area are estimated at approximately 70 thousand units per year.

The Baltimore program was originally established to supplement the hospital blood banks' supply by *replacing* the blood used for Red Cross eligibles. However, with the introduction of the revolving credit system, sufficient flexibility has been developed so that the Red Cross now distributes blood *in advance of credits,* which is used by the hospitals as needed for any patient. Accordingly, when the Red Cross advances blood to a hospital, it is considered the property of that hospital to be used as needed with the understanding that the hospital take steps to balance the credits used by Red Cross eligibles with the total amount advanced to the hospital.

The Red Cross does not transfuse any blood. It is the aim of the Red Cross, in partnership with the hospital blood banks, to obtain the total amount of blood needed.

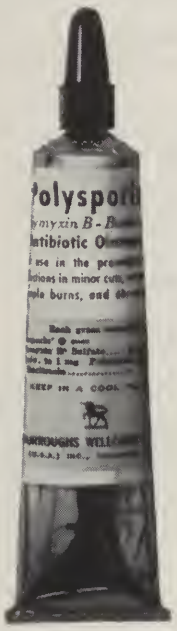
The Red Cross also assists hospitals in supplying blood, as available, for *community needs,* including lifesaving emergencies, blood for leukemia and hemophilia patients, and blood for indigents.

All Red Cross blood which is not distributed for transfusion is processed into important derivatives. From December 1, 1958, to December 1, 1965, the 32 participating hospitals received the following:

163,801—units refrigerated whole blood
876—units serum albumin (5%)
3,192—units fresh frozen plasma
795—20 cc units serum albumin
3,410—100 cc units serum albumin
2,573—units gamma globulin
299—units fibrinogen
1,340—units packed red cells
33,076—units gamma globulin were also distributed through the Maryland State Department of Health.

Of the 163,801 units of refrigerated whole blood, 17,379 units were donated to the hospitals to assist those *blood indigents* who could not replace their own blood or were not able to shoulder the financial burden. From the PULSE refrigerator an additional 4,329 units were rushed to the hospitals to help save the lives of 836 patients who needed blood because of an unexpected bleeding emergency.

The original agreement provided for the later development of a Lifesaving Emergency Blood Donor Corps, which would concentrate on enrolling persons of rare types and groups to further assist the hospital blood banks in meeting the general community needs. At a meeting of the Medical Advisory Steering Committee, November 13, 1963, it was considered highly desirable that the Red Cross should take steps to further expand its program to include the emergency donor corps. By so doing, the Red Cross established a separate blood inventory which is reserved for cases certified by the attending physician as being lifesaving emergencies. To make this program successful, the close cooperation of pathologists, blood technicians, and hospital administrators is essential. An effective control was established. The hospital technician is required to secure special authorization from the attending physician, which he submits in writing (within 72 hours) for review by the selected members of the Medical Advisory Committee. Replacements to the pool are made from special evening donations from members of PULSE (Public Unit for Life Saving Emergencies).



To establish the PULSE donor corps, the Red Cross Recruitment Committee and staff visited the existing blood assurance groups to enlist the support of management and the cooperation of their groups to obtain individual pledges to give blood on call. The Red Cross also invited the general public to join the emergency corps. The active support of the Baltimore Metropolitan Coordinating Blood Council, the Association of Commerce, the AFL-CIO Labor Council, and other appropriate organizations was sought. The PULSE donor corps was properly publicized to stimulate group and individual participation. All donors who are not already covered receive assurance of blood replacement for themselves and their families. The emphasis is placed on community service.

A special group of Red Cross volunteers was organized to assist in scheduling the appointments for the evening PULSE donations. All bloods collected are drawn by certified registered nurses under the supervision of a licensed physician, in accordance with the medical standards of the National Institutes of Health.

The PULSE program requires the continuing cooperation and support extended by civic leaders, the medical and hospital authorities, and the donors who are concerned with the blood needs of our community.

MEDICAL EMERGENCY DISASTER SERVICE COMMITTEE

Mr. President and Members of the House of Delegates:

The MEDS Committee sponsored a resolution urging federal legislation to provide a definition of civil defense to include natural as well as war disasters. This resolution was approved by the House of Delegates in September, 1965.

Several members of the committee attended a meeting of OCD regions 1 and 2, sponsored by Committee on Disaster Medical Care of the AMA Council on National Security, held in Washington, D. C., in August.

Two recommendations were made by the committee to the Executive Committee: 1) that hospitals be urged to combine their Emergency Room Committee and Medical Disaster Committee to make them more active parts of hospital staffs; 2) that hospitals be urged to enforce requirements for two disaster drills per year. These suggestions were carried out in a letter from the Faculty to all general hospitals.

Two bills backed by this committee, which would have extended licensure privilege to out-of-state doctors, dentists, veterinarians, etc. in time of emergency, failed to pass the General Assembly.

The MEDS Committee chairman attended the Conference on Medical Care in Chicago, which was entirely directed toward *natural* disasters.

This committee plans to request an exhibit at the 1967 Annual Meeting, and plans will be made soon for its preparation.

The State Department of Health has implemented a program of Medical Self-Help Training in schools throughout the state, with the support of the Faculty's Subcommittee on Medical Self-Help.

SUBCOMMITTEE ON PHYSICIAN ASSIGNMENTS: Raymond M. Cunningham, M.D., chairman, E. Roderick Shipley, M.D.

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

A new chairman of this committee was appointed from the ranks of the attorney members. Three subcommittees were appointed.

A symposium, "X-rays in the Courtroom—Fact or Fiction," was prepared by the Symposia Subcommittee and held in December. Another is to be presented at the 1966 Annual Meeting on "Alcoholism and the Law."

Most of the work was accomplished through the Subcommittee on Interprofessional Relations. Several meetings were held to discuss individual requests for assistance from both attorneys and physicians because of a lack of understanding of the Medicolegal Code of Cooperation. Each case was acted upon individually. Certain points of the Code will be clarified in the hope of achieving greater cooperation between the professions.

The question of fees for expert testimony keeps cropping up. The committee is awaiting decisions of the AMA-ABA in this connection so that local problems may be settled.

An Ad Hoc Committee on Traffic Safety was created to consider problems of enforcement of current traffic laws and study of proposed legislation. This committee has not yet met.

Respectfully submitted,
Howard F. Kinnamon, MD, chairman
Conrad Acton, MD

MEMBERSHIP COMMITTEE

Mr. President and Members of the House of Delegates:

A survey meeting was held by this committee in which present membership and ways of increasing membership were discussed. As a result, a letter was sent to all other state medical societies requesting any solutions they might have found for attracting new members. No outstanding or particularly applicable suggestions were made. In the future, attempts will be made to contact new physicians intending to practice in Maryland.

Eighty new members were admitted to membership in 1965, bringing active membership up to 2,932.

Respectfully submitted,
Nathan E. Needle, MD, chairman
Samuel Borssuck, MD
Edward Davens, MD
Robert A. Gaertner, MD

NOMINATING COMMITTEE

Mr. President and Members of the House of Delegates:

(Those elected will assume office at conclusion of the Annual Meeting 1967, unless otherwise indicated.)

President-elect
Richard D. Bauer, Adelphi — President-elect 1966-67; President 1967-68

First Vice-President
HOUSTON S. EVERETT, Baltimore

Second Vice-President
J. HOWARD BEARD, Annapolis

Third Vice-President
FRANCIS J. TOWNSEND, Ocean City

Secretary
WILLIAM A. PILLSBURY, Timonium

Treasurer
KARL F. MECH, Baltimore

Councilors
WILLIAM CARL EBELING, Baltimore, Central District (1970)
J. ARTHUR WEINBERG, Baltimore, Central District (1970)
JOHN F. SCHAEFER, Baltimore, Central District (1970)
JOHN COLLINS HARVEY, Baltimore, Central District (1970)
WILLIAM G. SPEED, III, Baltimore, Central District (1970)
ELDRIDGE H. WOLFF, Cambridge, Eastern District (1970)
WILLIAM B. HAGAN, Riverdale, South Central District (1969) (to assume office 1966)
HENRY P. LAUGHLIN, Bethesda, South Central District (1970)

Delegate to American Medical Association
RUSSELL S. FISHER, Baltimore
(Jan. 1, 1967-Dec. 31, 1969)

Alternate Delegate to American Medical Association
M. MCKENDREE BOYER, Damascus
(Jan. 1, 1967-Dec. 31, 1969)

Committee on Program and Arrangements

OCCUPATIONAL HEALTH COMMITTEE

Mr. President and Members of the House of Delegates:

The Occupational Health Committee met with Messrs. Gibbs and Donnelly, of the Baltimore Area Council on Alcoholism, and John H. Hirschfeld, MD, chairman of the Faculty's Subcommittee on Alcoholism, to discuss alcoholism in industry and ways of recognizing and dealing with it.

In October, 1965, the chairman attended the Congress on Occupational Health in Indianapolis.

Informational material on venereal disease was forwarded to each member of the committee for use in dissemination of this vital information.

Several minor points, such as cooperation with attorneys in supplying patients' reports, on proper request, were discussed and disposed of. Attention will be given in future meetings to problems and programs of industrial nurses.

Respectfully submitted,
JOHN R. DAVIS, MD, chairman

HENRY L. WOLLENWEBER, MD

COMMITTEE ON POSTGRADUATE EDUCATION, PREVENTIVE MEDICINE, AND PUBLIC HEALTH

Mr. President and Members of the House of Delegates:

This busy committee has studied, approved, or disapproved many projects and recommendations during the past year. Most of its work is carried out by dedicated subcommittees, with the parent committee meeting quarterly to coordinate activities and pass on recommendations.

Among the achievements of this committee during the past year are: 1) a Salmonellosis Seminar, held in conjunction with the State Department of Health and the USPHS Communicable Disease Center, 2) inauguration of the Medical Education's Dedicated Instructional Channel (MEDIC) for postgraduate education, 3) an unusually successful diabetes detection campaign, 4) an effective tetanus immunization program for industry and the general public, 5) completion and circulation of a retirement booklet, 6) a special issue of the *Maryland State Medical Journal* on "The Mores of Medical Practice," 7) cosponsorship with the Medicolegal Committee of a symposium on "Alcoholism and the Law," to be presented at the Annual Meeting, 8) the writing of a bill to enlarge and amend the present Battered Child law, 9) an active campaign to encourage the enactment of the Implied Consent law.

The Salmonellosis Seminar, held at the Faculty building on October 8, was a well-organized and stimulating conference which attracted many people throughout the state. Its purpose was to alert laboratory personnel and physicians to the recognition and prophylaxis of this common disease.

The March, 1966, issue of the *Maryland State Medical Journal* comprised articles written by members of this committee on the less pleasant aspects of medical prac-

tice, such as drug addiction, alcoholism, traffic safety, and malicious treatment of children. These distasteful areas of human behavior are too often ignored by the practicing physician, although he comes in constant contact with them during his daily practice. This issue of the *Journal* appeals to physicians to understand and treat these problems of medical practice.

Aging—The chief endeavor of this subcommittee has been the printing and distribution of an informative booklet for people contemplating retirement. It describes how they can enjoy fully their new-found freedom. This has been well received by both physicians and the general public, and many additional copies have been requested. Copies are still available from the Faculty office.

Alcoholism—This group has persisted in its work for the advancement of treatment of alcoholism. Through the personal efforts of some members of the subcommittee, several programs have been presented to physicians depicting the treatment of the alcoholic patient. The members of this subcommittee have given unstintingly of their time and have traveled at their own expense to present these programs. A study of the number of psychiatrists in Maryland treating alcoholics, conducted with the cooperation of the Committee on Emotional Health, has provided statistical data. At the request of the Subcommittee, the Council endorsed the Eastern Health District Alcoholism Clinic for an indeterminate period of time. Other activities include the preparation of a symposium on "Alcoholism and the Law" in cooperation with the Symposia Subcommittee of the Medicolegal Committee, to be presented at the Annual Meeting. An exhibit on the treatment of alcoholism will also be displayed during the meeting.

Most recently, the Council of the Faculty and the Executive Board of the Baltimore City Medical Society have approved a recommendation of this subcommittee that a detoxification center be established at the Baltimore City Hospitals. The members of the subcommittee are cooperating with the Mayor's Task Force on Alcoholism to have this much needed facility become a reality.

Plans are also being formulated to present a program on alcoholism over the MEDIC network in the fall.

Through the determined efforts of this group, many advances have been made during the past year and inroads established, which will enable further progress in the aspirations of this subcommittee.

Child Welfare—One of the aims of this subcommittee has been to extend the present legislation pertaining to the battered child to include a central reporting agency and broadening the mandatory reporting requirement to include other professional persons beside physicians. An ad hoc committee was formed to coordinate action with other interested groups, such as the courts, the Criminal Justice Commission, Welfare Department, nurses, and educators. A bill was drafted and presented in the state legislature. Further comment on this legislation may be found in the Legislative Committee report.

An exhibit on the Battered Child Syndrome and one on the Day Care Centers for the Mentally Retarded will be displayed during the Annual Meeting this year through the sponsorship of this subcommittee.

The Council's approval of a statement encouraging the schools in Maryland to engage in a program of tuberculin testing, issued by the Maryland Thoracic Society, represents another success of this subcommittee. We hope this will be implemented in Maryland schools soon.

Continuing Medical Education Program (MEDIC)—After the House of Delegates allocated money from the Educational Fund in September, this project began to take form. It began with presentation of two programs each month to 16 locations and has grown to presentation of from 17 to 22 programs each month to 24 locations. The programs are consistently of the highest quality and are presented mainly by the University of Maryland School of Medicine, Frederick Memorial Hospital, and the Johns Hopkins University School of Medicine. Pediatric and medical grand rounds are also produced weekly from the Johns Hopkins Hospital, and medical grand rounds from the University Hospital will be in the near future. Other presentations have been made by the Joint Anesthesia Study Committee of the Baltimore City Medical Society and the Baltimore City Health Department, the Maryland Pediatric Society, and the Anne Arundel General Hospital.

A series of lectures on the care of the newborn is being presented for nurses, and the Maryland Public Health Association is producing a monthly program for the education of its members.

As interest in the lectures grows and more physicians become aware of their availability, more hospitals are asking to join the network.

This project has proved to be one of the most meritorious activities engaged in by the Faculty, as substantiated by the increasing attendance at the lectures and the many favorable comments.

The Committee on Postgraduate Education, Preventive Medicine, and Public Health recommends that the House of Delegates appropriate from the Educational Fund an additional amount up to $10,000 to be used through December 31, 1966, by the Continuing Medical Education Program Subcommittee to continue and expand the MEDIC network.

Chronic Respiratory Diseases—This subcommittee replaced the former Subcommittee on Tuberculosis. The first area studied was a recommendation that beds, which supposedly are available in the tuberculosis hospitals, be used for persons suffering from chronic respiratory diseases. After thorough consideration, the subcommittee agreed that these beds are not available and that it would be better to have these patients cared for in a more accessible locale. A suitable location for a treatment center is now being sought.

This group is also concerned with the mounting problem of air pollution. It hopes to recommend some concrete corrective steps to combat this menace in the near future.

Diabetes—A three-day diabetes testing program was held again this year at the Fifth Regiment Armory for residents of the Baltimore City area. A new type of retesting program for people with a positive test result was conducted with the cooperation of the Baltimore City Health Department and the State Department of Health. This has proved most advantageous. The success of this follow-up program will attract attention throughout the nation, as this was the first area to employ this form of examination.

A two-day diabetes detection center was held in the Salisbury area, and a one-day program was conducted in Hagerstown. The Baltimore County Diabetes Committee administered a Dreypak campaign with the cooperation of pharmacies in the area.

Many previously unknown diabetics were discovered

during these detection drives, and useful statistical data were accumulated.

Maternal Welfare—Monthly publication in the *Maryland State Medical Journal* of cases of maternal deaths which may possibly have been prevented has been one of the activities of this subcommittee. Cases are reviewed regularly and the most instructive ones are printed. We hope that the Faculty attorney will make a new ruling to enable earlier publication of cases. At present cases are held for three years before publication, and this detracts from the educational value.

Plans are being made to enlarge the membership of this subcommittee and the scope of its activities to delve more deeply into maternal welfare, in order to cooperate more fully with a national survey to be conducted by the American College of Obstetricians and Gynecologists in the coming years and to promote improved maternal care in Maryland.

Pelvic Cancer—The study undertaken last year to determine the incidence and treatment results of carcinoma of the cervix in the State of Maryland has progressed under the direction of Dr. James H. Dorsey. It is anticipated that this survey will be completed during the next few months. No further activity of the subcommittee is planned.

Tetanus Immunization—A comprehensive tetanus immunization program has been conducted by this subcommittee for the past two years. Posters and educational pamphlets urging immunization have been distributed to industrial firms, pharmacies, and physicians throughout the state. With the completion of this worthwhile public service, the subcommittee requested its discharge. We are indebted to this group for implementing such an outstanding program for the education of both physicians and the general public.

Traffic Safety—Facing apathy among the general public, the legislators, and the physicians, this subcommittee has tried many ways of attracting attention to the much neglected and infinitely complex task of promoting traffic safety. The members of the subcommittee have engaged in a personal campaign to encourage the legislators to enact the Implied Consent law, which has been proposed to the State Legislature for the past several years. Further information on this bill may be found in the report of the Legislative Committee.

An ad hoc committee has been formed to plan a seminar on traffic safety in cooperation with the Maryland Chapter of the American College of Surgeons. We hope to hold the seminar this fall in order to generate enough public concern to force the legislature to enact much needed highway safety laws and, through this, to reduce the mounting carnage on the roads.

The chairmen of the subcommittees are to be congratulated for their alertness and industry in performing their assigned duties, which have made this a most productive and successful year for the Committee on Postgraduate Education, Preventive Medicine, and Public Health.

COMMITTEE ON PROGRAM AND ARRANGEMENTS

Mr. President and Members of the House of Delegates:

The 167th Annual Meeting of the Medical and Chirurgical Faculty, in April, 1965, under the chairmanship of Richard T. Shackelford, MD, was a complete success from all aspects. The total registration, was 1,412, of which 889 were physicians. This was the largest number of physicians to register at a Faculty meeting. The other registrants were mainly paramedical persons, including interns, nurses, and medical students, and exhibitors. Both the Round Table Luncheon and the Presidential Dinner were well attended.

Health evaluation tests for physicians were given for the second year. More than 250 persons were tested, about 70 more than in 1964. Many previously unknown abnormalities were found, and these are being followed up by the chairman, W. Bradley King, MD, and the 1964 chairman, Charles S. Petty, MD.

All technical exhibit space was sold, and scientific exhibit space allotted. The exhibitors were well pleased with the interest shown by those attending the meeting.

The Commander Hotel, in Ocean City, was again the headquarters for the 1965 Semiannual Meeting on Friday, September 10. This meeting was planned by the current committee. The registration was 429, one of the highest in the history of the fall meetings. Robert J. Stewart, administrator for the President's Council on Physical Fitness, gave an enlightening and entertaining discussion on "The Doctor's Role in Physical Fitness."

The Woman's Auxiliary held a meeting featuring a representative from the Institute for Biomedical Research, AMAERF. On September 11, there were meetings of the Maryland Chapter of the American College of Surgeons, the Maryland Psychiatric Society, and the Maryland Diabetes Association. All were well attended. A dinner-dance was held in conjunction with the Faculty's meeting. There was a capacity attendance for the dinner, but not many remained for dancing.

The 168th Annual Meeting will be held at the Alcazar in Baltimore, April 27 and 28, and will be continued aboard the SS Argentina to Bermuda from April 29 to May 4. The same number of scientific sessions as in previous years has been scheduled in Baltimore, starting in the morning of April 27 instead of the afternoon. The House of Delegates will convene on Tuesday evening and Friday morning in the Faculty building. Distinguished physicians from throughout the United States have accepted invitations to present lectures. The first Amos R. Koontz Memorial Lecture will be given by two local surgeons representing the University of Maryland School of Medicine and The Johns Hopkins University School of Medicine.

Each day of the Bermuda Cruise Convention will feature lectures by prominent members of the Faculty and grand rounds films. At this writing, more than 80% of the ship accommodations have been reserved by members of the Faculty and their families.

The usual scientific and technical exhibits will be displayed at the Alcazar. Once again, there is a waiting list of prospective exhibitors, both technical and scientific. Health evaluation tests will be available for the third year, under the chairmanship of Edward L. Sherrer, MD. These have proved to be both popular and worthwhile.

Our committee appreciates diligent efforts of the Faculty staff in carrying out the many details contributing to the success of our meetings.

Respectfully submitted,
John Collins Harvey, MD, chairman
James B. Brooks, MD
Thaddeus E. Prout, MD
Joseph D. B. King, MD
Donald B. Lurie, DDS

SUBCOMMITTEE ON EXHIBITS: James B. Brooks, M.D., chairman, Thaddeus E. Prout, M.D., Richard R. Crane, Sheldon Friedman.

PUBLIC RELATIONS COMMITTEE

Mr. President and Members of the House of Delegates:

The committee met in conjunction with the Legislative Committee. The concept of community service by physicians was unanimously endorsed by the joint group, which included members of the dental profession. Aims and purposes of the educational program of the Faculty were also discussed.

Criteria of the Community Service Award were revised for clarification. Selection was made of the winner of the 1966 award.

A full time staff member was assigned to work solely with Woman's Auxiliary officers, and $500 will be used from the Faculty's operating budget for stationary, printing, etc.

A Subcommittee on Quackery was formed, with the intention of holding a public Congress on Quackery. Material is now being obtained, and other organizations, such as the Heart Association, the Cancer Society and the Arthritis Foundation, will be contacted for possible inclusion in the program.

A series of 12 newspaper articles on various health subjects, entitled, "Your Health and Medicine," was published by the *Baltimore American*, with the assistance of several physicians. This series has already won the Albert & Mary Lasker Award for medical journalism and is a contestant for the 1966 Medical Journalism Award of the American Medical Association.

A proposal to link the physicians of Maryland in a communications network for transmittal of medical education programs was introduced. This program, known as MEDIC, has been developed through another Faculty committee and now links 21 hospitals as well as Hospital Council, State Health Department, and the Faculty. Money from the Faculty's educational fund was requested of the House of Delegates and approved in September, 1965.

Guidelines for the expenditure of the educational funds raised by the special assessment were set out by this committee and adopted by Council. This information, together with data on current expenditures and appropriations from this fund, are to be included in a general mailing to members.

A joint communications workshop and conference was held with the cosponsorship of the dental society. Attendance was good and interest ran high as members of the news media and other public representative groups gave their frank opinions of the medical profession. A panel of physicians and dentists reviewed the program and summarized comments and criticisms.

The annual Smith, Kline and French Speech Training Clinic is planned for October, 1966, in Baltimore, this being the earliest date available. Physicians, dentists, and Woman's Auxiliary members will be invited. Participants will be asked to put their training to use in fulfilling speaking engagements for the Faculty.

Groundwork has been laid for the berthing of the hospital ship HOPE in the port of Baltimore sometime within the next year. Contact has been made with port authorities to see that certain conditions are met.

A seminar for medical assistants was held in April, 1966. Subjects of interest to aides, nurses, and medical secretaries were discussed, such as billing procedures, office organization, legal aspects of medicine, and Medicare.

A program of educational meetings with executive secretaries of component societies has been instituted to keep them informed on current matters and to solve any problems that may exist.

The Public Relations Committee has had a busy year. Its members agree that creating and maintaining the favorable image of the physician in the mind of the public is becoming more and more difficult in the light of recent conflicts. It is, however, the consensus that public relations starts with the individual physician in his own office, clinic, laboratory, and operating room. We call on the profession to assist this committee in the work that must be done.

SUPPLEMENTAL REPORT OF THE CHAIRMAN

The Public Relations Committee held a statewide seminar for medical assistants on April 6, 1966, and considered it important enough to include in this report as a supplement. This all-day seminar, held in Osler Hall, was sponsored by the Public Relations Committee for the benefit of physicians' aides, secretaries, nurses, and other office assistants. The program consisted of talks by knowledgeable persons in the field, followed by question and answer periods. Response has been very enthusiastic, and similar workshops are planned on an annual basis, or more often if feasible.

Respectfully submitted,
Manning W. Alden, MD, chairman
John W. Clark, MD
David S. Clayman, MD
Robert B. Goldstein, MD
Calvin Y. Hadidian, MD
Walter E. James, MD
Robert L. Gray, MD
H. Berton McCauley, DDS
E. Roderick Shipley, MD
Mrs. John E. Baybutt
Joseph H. Seipp, Jr., DDS

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

Your Reference Committee met on Thursday, March 31, 1966, to discuss the two resolutions introduced for consideration by the House of Delegates on April 29, 1966. The meeting was well attended and the discussion was most interesting.

As has been the custom, your Committee will recommend action to the House. The question, however, will be on the Resolution itself and not upon the Committee report. All decisions were reached in accordance with the Faculty's Bylaws, Article X, Section 23.

RESOLUTION 1A/66

Submitted on: January 26, 1966

Introduced by: Maryland Radiological Society

Subject: Support Separating Professional Fees from Hospital Charges

Whereas, It is now the declared policy of the American College of Radiology that members of the College shall separate their professional fees from hospital charges and present their own bills to all patients expected to pay for services; and

Whereas, The House of Delegates of the American Medical Association on October 3, 1965, stated, "Hospital-based medical specialists are engaged in the practice of medicine. The fees for the services of such specialists should not be merged with hospital charges. The charges for the services of such specialists should be established, billed and collected by the medical specialist in the same manner as are the fees of other physicians."; and

Whereas, Congress established under the Medicare law, PL 89-97, provisions covering Radiology solely as a medical service, and radiologists are obligated to obey those legislative provisions; and

Whereas, The identification of radiology as a hospital service has led physicians away from training in the specialty of radiology, and has jeopardized the future of radiological practice and thus of all medical care due to professional personnel shortages; and

Whereas, Separate billing for professional services is feasible and desirable for *all* patients served by radiologists in hospital departments, just as it is for surgeons, obstetricians, internists, anesthesiologists, and other practitioners of medicine; now, therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland supports the policy of the American College of Radiology, the American Medical Association, and of Medicare law PL 89-97, of separating professional fees from hospital charges; and

Resolved, That copies of this resolution be sent to the American College of Radiology, the Hospital Council of Maryland, Maryland Hospital Service, Inc., and Maryland Medical Service, Inc.

This resolution is similar in content and intent to one introduced at the AMA House of Delegates session in Philadelphia in December, 1965. This was adopted unanimously by that House.

The Faculty's Council has also endorsed this principle at its January 27, 1966, meeting.

In view of this, and the Faculty's long-standing position that professional fees be separate from hospital charges, your Reference Committee recommends adoption of this resolution.

RESOLUTION 2A/66

Submitted on: January 27, 1966

Introduced by: Washington County Medical Society

Subject: Requesting Legislation for the Creation and Maintenance of a School of Medical Technology within the University of Maryland

Whereas, The shortage of properly qualified medical technologists remains acute, appears to be worsening and will become more and more acute in response to the increasing demands of coming years, and in view of the fact that theirs is a profession in which the work involved is becoming increasingly complex and important to patient care so that it is felt action must be taken at once to relieve the situation; therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland requests that the Maryland General Assembly appropriate the initial sum of at least fifty thousand dollars for the establishment of a formal School of Medical Technology at the University of Maryland and that sufficient appropriations be made annually thereafter for maintenance of same; and

Resolved, That the University of Maryland be commissioned and designated to establish and operate this school on a scale specifically designed to benefit equitably all geographic areas in the State of Maryland and expressly with the purpose of relieving present and future shortages in medical technologists in all areas of the State of Maryland; and

Resolved, That this School of Medical Technology be established within the University of Maryland in an organizational manner analogous to that of the Schools of Medicine, Dentistry, and Pharmacy; that the standards maintained in this school be satisfactory to the American Medical Association, the American Society of Clinical Pathologists, and the American Society of Medical Technologists, and to their respective Maryland component societies, and that the graduates be awarded the B.S. degree and be eligible by examination for certification and the professional designation M.T. (ASCP).

In recent weeks, considerable newspaper publicity has been published, all dealing with the shortages in these areas. In addition, the 1966 General Assembly adopted several resolutions urging attempts be made to recruit paramedical personnel.

For several years now the Faculty has participated in the Maryland Health Careers Council, a cooperative effort on the part of health and health-related agencies

to cooperate effectively in recruitment of young people into medicine, nursing, and other allied health fields.

The State Department of Health in its 1966 fiscal year budget requested the sum of $50,000 to establish a career recruitment program aimed specifically at the shortages in the health-related fields. This was cut from the budget by the Budget Bureau.

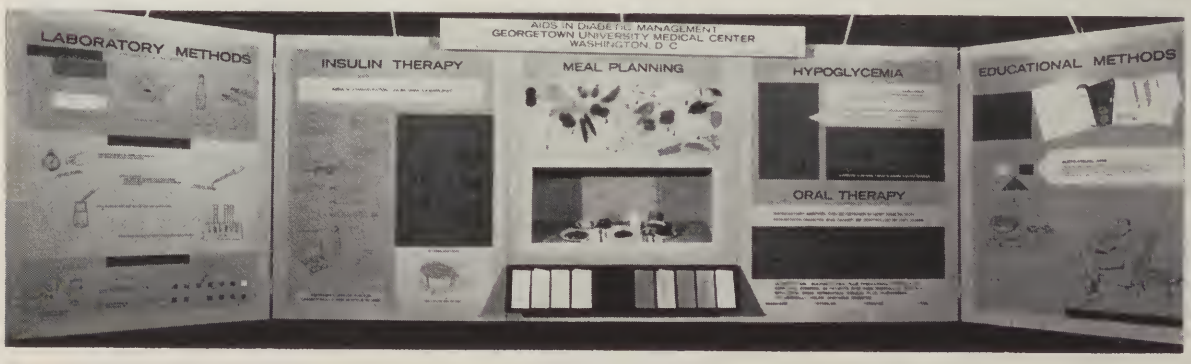
The Governor's Commission to Study the Shortage of General Practitioners in Maryland made a similar recommendation, although emphasis was to be placed on the recruitment of young people who would enter the field of medicine and agree to practice in the more rural areas of the state.

Since the introduction of Resolution 2A/66 and the appearance of several stories in the newspaper emphasizing the shortage of medical technologists, an announcement has been made by Wilson H. Elkins, president of the University of Maryland, that such a course may be instituted at the College Park campus in the fall of 1967. Funds for establishment of such a course would be included in the fiscal 1968 budget, it was stated.

It is evident that a shortage exists in the areas outlined in this resolution. Adoption of the resolution would add strength to the proposal as suggested by Dr. Elkins.

Your Reference Committee, therefore, recommends adoption of Resolution 2A/66.

It is noted that other schools may also be willing and able to establish such schools by coordinating their activity with hospitals, as well as other means. **In view of this, the Reference Committee also recommends that all appropriate universities in Maryland be requested to give this possibility some study and be advised that the counsel and advice of the Faculty and its members are available in this area.**

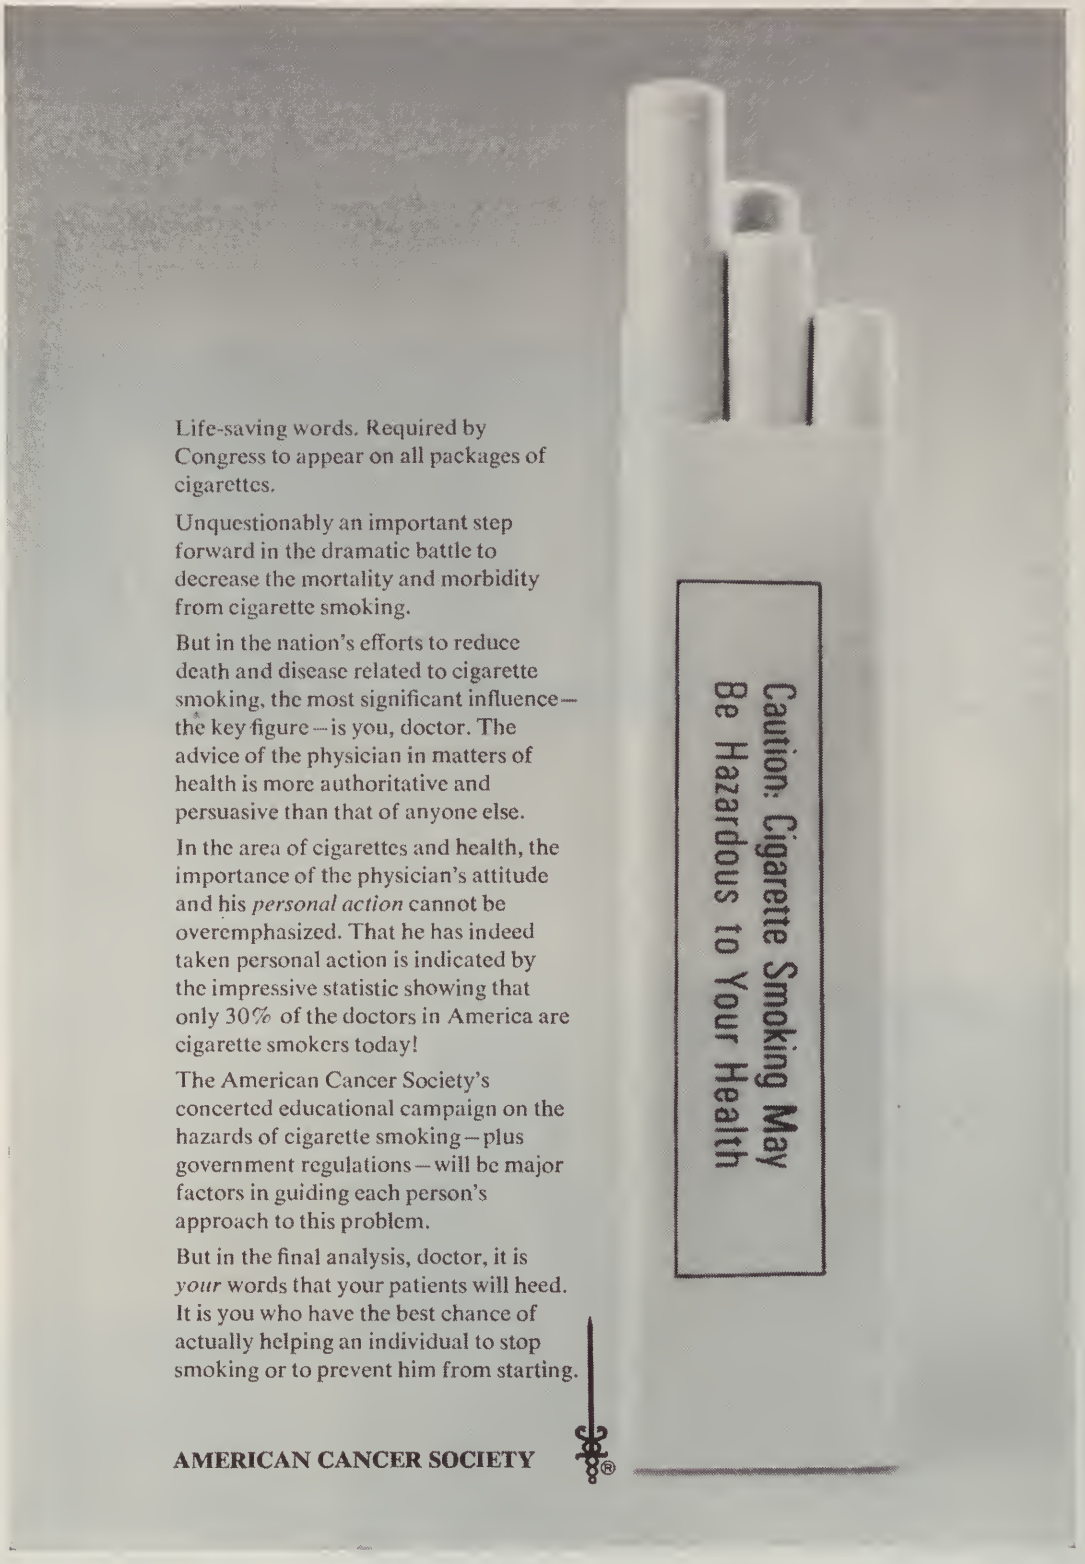


The Reference Committee also has an additional recommendation that the Faculty's Legislative Committee and approved legislative representative at the Annapolis General Assembly sessions be instructed to work closely with the University of Maryland in ensuring that funds for development of this course of training are retained in the University of Maryland budget.

The Reference Committee expresses its appreciation to all who assisted in its deliberations.

Respectfully submitted,
William B. Hagan, MD, chairman
DeWitt E. DeLawter, MD
Everett S. Diggs, MD
William G. Helfrich, MD
Howard F. Kinnamon, MD

An Aesculapius Award, offered by Mead Johnson Laboratories, was presented to De Witt E. De Lawter, MD (left), for his exhibit "Aids in Diabetic Management." During the 1966 Annual Meeting, a committee of the Medical and Chirurgical Faculty selected this exhibit as the one best representing "excellence in concept, originality, and execution of a scientific exhibit." John Collins Harvey, MD, chairman of the Faculty's Committee on Program and Arrangements, made the formal presentation of a plaque, a certificate, and a check for $200.



This award will be given again in 1967. All exhibits accepted for showing at the 1967 Annual Meeting of the Medical and Chirurgical Faculty will be eligible for judging. Physicians interested in showing an exhibit at this meeting should apply to the Chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty of the State of Maryland, 1211 Cathedral Street, Baltimore, Md 21201.

While Maryland and Bermuda physicians shared medical information, their wives became acquainted at a tea given by the Maryland Woman's Auxiliary.

Life-saving words. Required by Congress to appear on all packages of cigarettes.

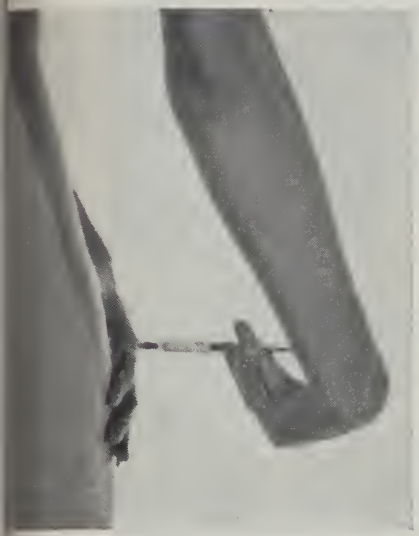
Unquestionably an important step forward in the dramatic battle to decrease the mortality and morbidity from cigarette smoking.

But in the nation's efforts to reduce death and disease related to cigarette smoking, the most significant influence—the key figure—is you, doctor. The advice of the physician in matters of health is more authoritative and persuasive than that of anyone else.

In the area of cigarettes and health, the importance of the physician's attitude and his *personal action* cannot be overemphasized. That he has indeed taken personal action is indicated by the impressive statistic showing that only 30% of the doctors in America are cigarette smokers today!

The American Cancer Society's concerted educational campaign on the hazards of cigarette smoking—plus government regulations—will be major factors in guiding each person's approach to this problem.

But in the final analysis, doctor, it is *your* words that your patients will heed. It is you who have the best chance of actually helping an individual to stop smoking or to prevent him from starting.



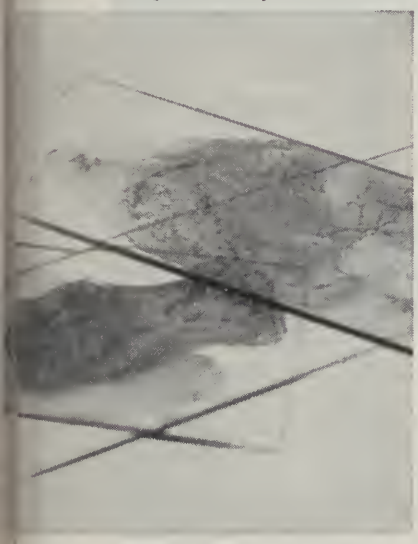
AMERICAN CANCER SOCIETY

New
low-cost tetracycline/antifungal therapy

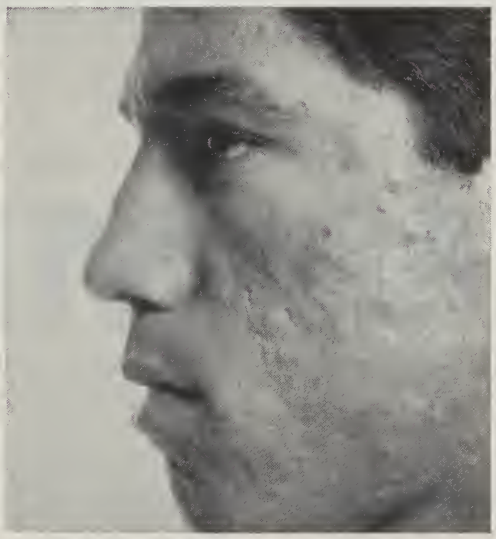
for broad-spectrum activity
plus specific antifungal prophylaxis
at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

liabetic patients



2. nonpregnant women with a history of recent or recurrent monilial vaginitis



3. elderly or debilitated patients

ıtients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

BRISTOL

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

Tetrex-F®

Ich capsule contains tetracycline phosphate complex equivalent to tetracycline hydrochloride 250 mg. and nystatin 250,000 units.

Tetrex-F is priced lower than most tetracycline-antifungal products.

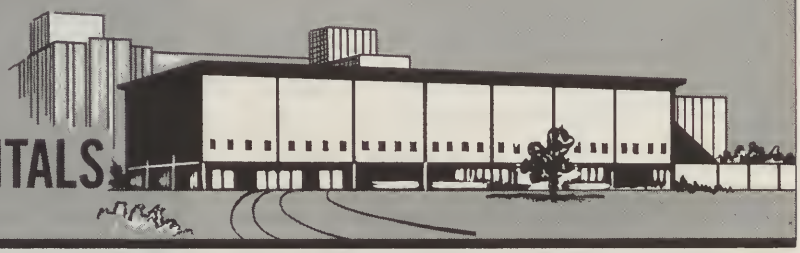
Night Leg Cramps...
Frequent Bedfellow in Diabetes, Arthritis, and Peripheral Vascular Disorders*

*"Nocturnal cramps occurring in the calf muscles and small muscles of the feet have been encountered in a significant number of diabetic patients."[1]

"... nocturnal cramps may be the presenting symptoms of patients with arteriosclerosis obliterans, deep thrombophlebitis, varicose veins, osteoarthritis..."[2]

now...specific therapy for night leg cramps

QUINAMM™



Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose ... helps restore restful sleep.

QUINAMM Composition: Each white, beveled, compressed tablet contains: Quinine Sulfate 4 grains (250 mg.), Aminophylline 3 grains (200 mg.). **Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastraintestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Contraindication:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets. **Caution:** Federal law prohibits dispensing without prescription. **References:** 1. HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 7.—The Bayview Asylum: The Influence of a University (1891- 1911)

It requires no prophetic eye, no special foresight, to discover that we are on the very verge of one of the most fearful and wide-spread revolutions in medicine that the world has ever witnessed; another of those astounding changes whose name is already legion, and which, whether for good or evil is destined to convulse the profession, and to exert a most powerful influence upon the practice of the healing art. (Samuel Gross, 1861)

The Revolution in Medical Teaching

In the year 1891, the Trustees of the Baltimore City Almshouse developed a system of student and residency training similar to what was being developed at the Johns Hopkins Hospital. Residents, assistant residents, and medical students were nominated by the medical schools to the Trustees for appointment at the Bayview Asylum. Students were directed to make up individual charts on patients in a methodical manner, to record treatment, and to keep progress notes. The three medical schools in Baltimore at that time—the University of Maryland, the College of Physicians and Surgeons, and the Johns Hopkins University—agreed to have one or more physicians from their respective faculties visit the Almshouse daily. The visiting men were required to be present at all important surgical or obstetrical operations. The residents were responsible to the visiting men; the assistant residents to the residents; and the student to the assistant residents. Four students were appointed by the University of Maryland and four by the College of Physicians and Surgeons to live in the Almshouse and pay the Trustees at the rate of $330 per year.

The influence of the Johns Hopkins Medical School at the Almshouse goes back to 1884, when Dr. William Welch arrived in Baltimore to begin his work as professor of pathology in the new medical school. He needed material with which to teach the students who had gathered around him. He turned to his assistant, Dr. William T. Councilman, a Baltimorean, who had been working at the Almshouse for several years. In following years, Drs. Councilman, Halsted, and Thomas, of the medical school, served as visitors in the insane hospital, reorganized the records, taught, and attracted younger doctors. Medical students were instructed in the insane hospital.

The revolution in medical education brought about at The Johns Hopkins Hospital and Medical School was the elevation of the practice of medicine from the bedside and autopsy table to the laboratory of the university and the research building. There was an advance from description and empiricism to planned experiment, statistical analysis and clinical trial.[1]

Specialization

A new influence was that of specialization. In 1885, the resident in the insane asylum for the first time made a separate report on the insane

Fig 1

William Thomas Councilman (1854-1933) MD, University of Maryland (1878); pathologist Bayview Asylum, 1879; student of von Recklinghausen at Strassburg and Cohnheim at Leipzig 1880-1883; visiting physician to the insane wards at Bayview (1883-1892); Shattuck Professor of pathology at Harvard Medical School, 1892. (Collection of Medical and Chirurgical Faculty of Maryland).

Fig 2

Views of wards in Bayview Asylum 1900.

patients. The only other service was a combined medical and surgical service. This division of the insane department from the general medical responsibility was the forerunner of more intensive specialization.

In 1890, a separate ward was established for patients with pulmonary tuberculosis. This was the first example in the United States of a separate ward for tuberculosis patients in a general hospital.

In 1893, the Trustees noted that many of the patients who entered the Almshouse returned to the community as valuable members thereof after they had received treatment. In 1894, unemployment was again recognized as affecting the infirm and elderly first.

In 1896, the admissions to the hospital were put on a more businesslike basis, a recognition of the fact that the problems of the poor could be handled in a logical and organized manner.

Around the turn of the century, a number of new influences developed at the Almshouse. The state mental hospitals began to take some of the insane patients, but the Almshouse insane hospital remained crowded. In 1897, a city ordinance abrogated the power of police magistrates to issue hospital permits to people appearing before them, thus decreasing the number of vagrants and alcoholics sent to Bayview. In 1898, a careful attempt to isolate all infectious diseases in the hospital was carried out. Improved screening of applicants to the Almshouse was started. These measures resulted in fewer insane, vagrant, and alcoholic people being admitted, making room for sick patients.

In 1904, another attempt was made to limit the power of police magistrates to send "beats and bums" to the Almshouse. It was pointed out that the Almshouse was neither a reformatory nor a penal institution. In 1906, a special plea was made by the Trustees for help in the care of chronic alcoholics and drug addicts. The problem of promiscuity in young girls was mentioned, and it was clear that the Trustees recognized that these were social problems that were not being met.

In 1908, in the report of the Trustees, a number of case histories were presented of patients with tragic social problems, demonstrating that the patients were the victims of circumstances and not responsible for their conditions.

In the same year, a special committee of experts was appointed by Mayor J. Barry Mahool to discuss the problems of the Bayview Asylum. It recommended a 300-bed hospital, more beds for tuberculosis patients, renovation and reconstruction of the Almshouse, and construction of new administrative facilities.

Growth of State and Federal Participation in Welfare Activities

Toward the end of the nineteenth century, the recurrent economic depressions brought acceptance of the view that poverty and unemployment might be the result of economic depression rather than individual fault. In 1908, certain states passed laws on industrial accidents, factory inspection, and regulation of child labor. The United States Children's Bureau was founded in 1912. A Federal Compensation Act, in 1908, covering government employees, led the way to state enactment of Workmen's Compensation laws. Workmen's Compensation laws, the welfare of children, a mother's pension law, and the needs of the blind all had their groundwork laid in many states before the First World War. The First World War and the period afterward resulted in little advance in the social reform movement except for the grants-in-aid for vocational rehabilitation of disabled persons in 1920.[2]

During the first two decades of the twentieth century, psychiatry increased its scope from that of a medical discipline to one including the study of psychological and social factors in mental illness. The development of social psychiatry from psychiatric social work was stimulated by the work of Elmer E. Southard in the second decade of the twentieth century.[3] Adolf Meyer, at the opening of the Phipps Psychiatric Clinic at The Johns Hopkins Hospital, in 1913, called for the broadest approach to psychiatric problems, using all possible disciplines and resources for their investigation. Particularly, he pleaded for psychiatric clinics to study and respond to the social and mental atmosphere of the local community.[4]

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets

In Granules for Oral Suspension

ERYTHROCIN®-SULFAS
Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

ABBOTT

COMPONENT MEDICAL SOCIETIES

BALTIMORE CITY

The Executive Board of the Baltimore City Medical Society met on May 10. **Dr. Hogan** discussed the problems of a fee schedule in relation to Blue Shield payments and the inception of the Medicare program. A thorough discussion ensued. It was agreed that a letter would be sent to Mr. Denwood Kelly, offering full cooperation of the Board of Directors of the Baltimore City Medical Society in assisting Blue Shield to prepare for the advent of Medicare.

A suggestion for a summer program was received from **Dr. George Vash.** In line with the decision taken by the Board of Directors at its meeting on April 12, Dr. Vash is to be notified that his activities were unnecessary.

Alfred C. Moore, MD, transferred from active to associate membership.

A sum of $100 is to be given to the Student American Medical Association at the University of Maryland for assistance of members attending the annual meeting.

John Collins Harvey, MD

HARFORD COUNTY

Speakers for the last three meetings of the Harford County Medical Society were **Byron Brogdon, MD,** on Radiologic Diagnosis of the Low-Back Syndrome; **William F. Rienhoff, Jr., MD,** on Carcinoma of the Lung, and **Donald Benson, MD,** on Cardiopulmonary Resuscitation. Subsequently, Heinz R. Linden, MD, chief of

At the March meeting, announcement was made that the Woman's Auxiliary to the Harford County Medical Society was making a donation to the AMA Education and Research Foundation for the student loan guarantee fund, in honor of the Harford County Medical Society on Doctors' Day March 30, 1966.

James McC. Finney, MD

WICOMICO COUNTY

Medicare rules and regulations were the topic for the May meeting of the Wicomico County Medical Society. Benefits, methods of physician reimbursement, and effect upon routine office business procedure were covered by a series of speakers, including **John Sargeant,** executive secretary of the Medical and Chirurgical Faculty; **Denwood Kelly,** director of the Maryland Blue Shield plan; **John Webb,** also representing Blue Shield; and **Leonard Kilbourne,** of Medical Management Consultants of Delmarva.

After the society meeting, Messrs. Sargeant, Kelly, and Webb remained in Salisbury to conduct a similar briefing program the next morning for office assistants. Approximately 55 physicians' employees attended that session, which was held in the auditorium of the Peninsula General Hospital School of Nursing.

"Some of us will smart for it"*

RUDIGER BREITENECKER, MD
Chairman, Ad Hoc Committee of the Traffic Safety Subcommittee

In 1965, nearly 50,000 persons were killed in traffic accidents, millions were injured, and untold millions of dollars in property damage were sustained. Maryland contributed her share in this "senseless slaughter" on the streets and highways with 696 traffic fatalities. The public and its political representatives are dulled by this daily mayhem on the road; some seem to considere it a risk of modern life, albeit an annoying one. More and more citizens, however, recognize the need of curtailing these untimely deaths, and a great variety of programs are in existence to enhance these perspectives. The yearly rising toll in traffic fatalities testifies to the poor results that such efforts have met. It is ironic to compare these frustrating efforts with the amount of energy and money spent on the solution of the poliomyelitis scourge, that at its worst killed less than one-tenth of the number killed in vehicular accidents.

What can be done? It seems that one of the major and well recognized causes that is amenable to correction should be attacked first and vigorously. This is the problem of the drinking driver. Year after year, we at the Medical Examiner's office find that half of the dead drivers were "under the influence" of alcohol, that is, their blood alcohol level was above 0.10%. Repeatedly it has been shown conclusively that such a driver is a menace to himself and, worse, to the lives of others as well. Yet the present judicial attitude shows complete unwillingness to adequately punish such offenders, frequently for "lack of evidence."

For many years efforts have been made to have Maryland legislators enact an implied consent law, which would allow temporary suspension of the driver's license for refusing a breath-alcohol test ordered by a law enforcement officer. Under present conditions a driver knows from extensive news coverage that it is fairly easy to beat a drunken driving charge.

Without such legislation, law enforcement and protection of the public against the menacing drinking driver are seriously jeopardized. This becomes evident by the increasing number of refusals to submit to the breath test, which had reached 40% in 1965. In the same year, 95% of the drivers tested had blood levels in excess of 0.10%, which means that their driving ability was seriously impaired.

One wonders about the motives that have prevented passage of this essential bill. The most common criticism is that this type of law is unconstitutional. However, this charge is unfounded, since 16 other states have such a law in effect, and many courts have held such legislation not to violate any constitutional rights. The American Trial Lawyers Association favored such legislation, and the Medical and Chirurgical Faculty has strongly endorsed the efforts of the law enforcement agencies to have such a bill passed; but it has been ignominiously defeated each time.

As physicians, we are concerned with prevention of traumatic as well as pathologic illness.

To furnish a tool to the authorities that would help eliminate irresponsible drivers from the roads *before* they cause an accident would help to achieve just such a goal.

For this reason the Traffic Safety Subcommittee of your society is working diligently to support passage of the necessary bills at the next legislative session. We will need all the support we can muster to influence the representatives of the people who want to survive the highway slaughter. Any suggestions of how to help achieve this goal will be welcome.

Most of my patients with high blood pressure are as old as I am. A lot of them are living on pensions. They're grateful when I can keep prescription costs down.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down

Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Kenneth B. Lewis, MD—*Editor*

A SERVICE OF
THE HEART ASSOCIATION OF MARYLAND

IDIOPATHIC MYOCARDIOPATHY

Part II: Treatment and the Role of Long Term Bed Rest

GUSTAV C. VOIGT, MD
Fellow in Medicine

KENNETH B. LEWIS, MD
Chief, Cardiovascular Service, and Assistant Chief of Medicine, Baltimore City Hospitals

Heart failure from idiopathic myocardiopathy is a challenging therapeutic problem. While it may respond satisfactorily at first, relapses are frequent and cardiomegaly, gallop rhythm, and chronic cardiac decompensation may persist in spite of ideal management. Low cardiac output, arrhythmias, and pulmonary and systemic emboli compound the situation further. Although the treatment of heart failure and its complications in patients with idiopathic myocardiopathy is basically the same as that for heart failure from other causes, certain aspects of this disease merit special therapeutic consideration.

Diuretics

Salt restriction and the judicious use of diuretics are routine measures in heart failure. Use of mercurials presents no particular problems in patients with idiopathic myocardiopathy. It has been suggested that thiazides not be used because of the danger of producing hypokalemia in patients who may be receiving digitalis and in whom arrhythmias are common.[1] We believe that thiazides can be used safely as long as supplemental potassium is given. Aldosterone antagonists, (spironolactones) may be beneficial in some patients who have edema refractory to other agents, but these drugs may produce hyperkalemia even when administered with thiazides, particularly in the presence of renal insufficiency which often is present in patients with idiopathic myocardiopathy who have extraordinarily low cardiac output and decreased renal blood flow.[2,3] Ethacrynic acid, a new and potent diuretic, is presently limited to investigational use. It should be given cautiously and only when more conventional measures fail to promote diuresis. Patients with edema, low cardiac output, and diminished renal blood flow may not tolerate the acute decrease in blood volume which may accompany the sudden and copious diuresis produced by this agent.[4,5]

Digitalis

It has been suggested that patients with idiopathic myocardiopathy are exceptionally sensitive to digitalis.[1,6] Such observations are diffi-

From the Departments of Medicine, The Johns Hopkins University School of Medicine and The Johns Hopkins Hospital and Baltimore City Hospitals.

This investigation is supported by USPHS Research Grant HE 2 ROI HE 05584 from the National Heart Institute and Clinical Center Grant FR-35 from the Division of General Medical Sciences.

Dr. Voigt receives support from a National Institutes of Health Research Fellowship I-F2-HE-28,655-01.

cult to evaluate since arrhythmias are common in this disease even in the absence of digitalis. Our experience, and that of others, indicates that most of these patients can tolerate digitalis and that it should be used when indicated.[6, 7] Shorter acting preparations, such as digoxin, are safer since the toxic effects are more readily reversed when the drug is stopped. Starting the patient on a maintenance dose rather than on the conventional loading dose may increase the margin of safety yet provide sufficient digitalis to improve myocardial function.

Anti-Arrhythmic Agents

The high incidence of arrhythmias, most commonly premature ventricular contractions and atrial fibrillation, may prompt the use of an anti-arrhythmic agent, such as quinidine or procaine amide. These drugs depress myocardial contractility, and their use in patients with poor myocardial function and low cardiac output must be considered carefully.[8] We would reserve the use of such drugs for potentially life-threatening arrhythmias and not use them to suppress frequent premature ventricular contractions unless they occur in runs or are multifocal and the threat of ventricular tachycardia or fibrillation exists.

Anticoagulants

The role of anticoagulants in patients with heart disease is controversial. If the therapeutic aim is to decrease the likelihood of pulmonary embolism from pelvic and deep leg vein thrombosis induced by shock, heart failure, or prolonged bed rest,* then the use of anticoagulants is probably salutary.[9] There is evidence, however, that they will not prevent mural thrombosis in the heart, a common event in idiopathic myocardiopathy and the source of systemic emboli.[10] Systemic emboli often occur in such patients who are adequately anticoagulated.

Steroids

Reversal of a deteriorating course concomitant with the administration of high doses of adrenocorticosteroids has been reported in patients with *acute* myocarditis. The use of steroids is justifiable and probably indicated in such patients who are not responding to other measures.[11-14] In idiopathic myocardiopathy, however, the response to steroids has been generally disappointing. There is little evidence of any therapeutic benefit, and undesirable side effects and complications of steroid therapy interdict their administration in any routine fashion. In an occasional patient with idiopathic myocardiopathy the addition of steriods seems beneficial, so their trial use in the desperately ill patient may be justified.[6, 12]

Long-Term Bed Rest

Patients with idiopathic myocardiopathy often have persistent cardiac dilatation and are in a state of chronic uncompensated heart failure. Since the dilated heart is inefficient and operates at a tremendous mechanical disadvantage in its function as a pump, prolonged bed rest in a controlled hospital environment has been advocated as a means of reducing blood volume and cardiac size and improving mechanical efficiency. Burch has reported a significant reduction in heart size and improvement in heart failure in patients with idiopathic myocardiopathy after periods of bed rest of 18 months or more.[1] The early results of our experience with a program of long-term bed rest in such patients appear to confirm his studies. In order to properly evaluate these observations, however, and to establish the place of long-term bed rest in the treatment of idiopathic myocardiopathy, we need to know the course of such patients after a period of bed rest. Because long-term bed rest imposes severe social and economic hardship on the patient and his family, it is important to learn whether the improvement brought about by such a program is maintained after he returns to the community and whether his ultimate prognosis is significantly altered.

*Burch reports that long-term bed rest does not seem to increase the incidence of pulmonary embolism in patients with idiopathic myocardiopathy.

Problems of Diagnosis in Chronic Diseases *Part II*

DOUGLAS G. CARROLL, MD
Chief of Physical Medicine and Rehabilitation, Baltimore City Hospitals

Hemiplegia

Cerebrovascular occlusion or hemorrhage followed by infarction of the brain with hemiplegia is such a common occurrence in elderly people that the presence of rare curable causes of hemiplegia is apt to be overlooked. It is possible that the recent interest in identifying stenosis of a carotid artery may result in prevention of a small number of cerebral infarctions. Patients with meningiomas, subdural hematomas, meningococcal meningitis, acute syphilitic meningitis, and tuberculous meningitis may present with hemiplegia of rather rapid onset. An early correct diagnosis and appropriate therapy in such patients may result in complete recovery.

A 16-year-old girl was transferred from another hospital, where she had been for two weeks with a hemiplegia and diagnosis of poliomyelitis. She was found at operation to have a subdural empyema and made a partial recovery after one year.

A 52-year-old man was transferred from another hospital, where he had been for a week with a diagnosis of cerebrovascular accident and hemiplegia. He was found to have a brain abscess, which was drained, but he did not regain complete function.

A 75-year-old woman, eight days before admission, was found to be unable to speak and became bedridden. The fundi were inadequately visualized. She responded minimally to commands. There was definite weakness in the left leg. The eyes deviated to the left. There was bilateral hypereflexis, a fixed and dilated left pupil, and a left facial weakness. She suffered several right sided convulsions. The plantar responses were extensor.

A lumbar puncture performed on the day after admission showed an opening pressure of 230mm of saline, three cells, and no increase in protein. The blood serologic test for syphilis was positive. The fasting blood sugar was 392mg% and the glucose tolerance test was abnormally high. Insulin, phenobarbitol, and a 1,500 calorie diet were started. The temperature rose to 103 on the eleventh hospital day, and penicillin and streptomycin were started with the presumptive diagnosis of aspiration pneumonitis. The fever persisted. The leukocyte count rose to 24,500, and she died on the sixteenth hospital day.

Postmortem examination showed a subdural hematoma covering the entire right hemisphere. There was atrophy and laminar necrosis under the hematoma. There were mild changes in the kidneys thought to be compatible with diabetes mellitus. There was syphilitic aortitis and slight enlargement of the heart with mild coronary artery thickening and myocardial fibrosis.

The gradual development of the hemiplegia, the presence of convulsions, the elevated spinal fluid pressure, and the dilated pupil suggested retrospectively that this patient did not have an ordinary cerebrovascular occlusion.

A 74-year-old Negro woman was admitted from a nursing home on July 14, 1961, because of a generalized convulsion. For several years there had been increasing mild disorientation, but the

patient never had experienced a previous convulsion.

Initial examination revealed a blood pressure of 175/110, a regular pulse with a rate of 92 per minute, and respirations at 16 per minute. The patient was somewhat disoriented, but except for evidence of moderate emphysema, the general physical examination was not remarkable. There was slight tenderness on percussion over the left side of the skull; no bruit was noted. Extraocular movements were normal, and there was no papilledema. There was a mild left hemiparesis and a moderate right hemiparesis with bilateral positive Babinski signs. Sensory examination was not entirely satisfactory, but there was no gross loss of position or vibratory sensation. Reflexes where hyperactive everywhere but slightly more in the right upper and lower extremities. There were no cerebellar signs.

On admission, the urine, blood, and electrolytes were normal. An expanding intracranial lesion was suspected. A brain scan with arsenic 74, on August 13, was unremarkable. A lumbar puncture yielded clear fluid with an opening pressure of 120 and a closing pressure of 85. The protein was 51 mg%, the chloride, 118mEq/l. There was no growth on culture. Electroencephalogram showed a diffusely abnormal record with a little more abnormal activity in the left hemisphere than in the right. It was felt that the tracing did not constitute good evidence for a space-occupying lesion. X-rays of the skull revealed advanced hyperostosis frontalis interna. No displacement of the pineal gland was noted.

On September 13, the jaw jerk was noted to be hyperactive and there was increased tone on both sides with greatly increased deep tendon reflexes but no clonus There was a well developed grasp reflex on the right. The patient's disorientation had increased since initial diagnosis.

Over the next few days the patient developed bronchopneumonia, refused to eat, developed severe hypernatremia, went into renal failure, and died on November 2.

A complete postmortem examination revealed pneumonia of the right upper and right lower lobes and the left lower lobe with diffuse emphysema. There was moderate atherosclerosis, nephrosclerosis, and hyperostosis frontalis interna. When the brain was removed from the cranial cavity, a 2x3cm pale pink mass was noted 4cm anterior to the optic nerves in the anterior fossa of the base of the cranium in the midline. This turned out to be a meningioma.

Endocrine and Metabolic

Methods of diagnosis of endocrine and metabolic disease have advanced as rapidly as our ability to treat them, and it is rare indeed for a patient with these diseases to die undiagnosed and untreated. To be sure, irreparable neural damage may occur before a diagnosis of pernicious anemia is made; and patients die of myxedema and Addison's disease, but generally not without a diagnosis.

One patient presented a most confusing clinical picture of anorexia, nausea, vomiting, weakness, dyspnea, tarry stools, electrocardiographic changes, a rising serum urea nitrogen, and lethargy—perfectly classical, in retrospect, of hypercalcemia (17.8 mEq/1) and parathyroid adenoma. Unfortunately, a blood calcium was not obtained until the day of death.

Summary

In the management and rehabilitation of elderly patients with chronic diseases, the physician must be alert to diseases which are treatable or curable. Treatable diseases may be concealed by the presence of another more obvious incurable disease. Treatable diseases most frequently missed are infections (especially tuberculosis), intra-abdominal abscesses, perforations and gangrene, various diseases presenting with a hemiplegia, and, more rarely, endocrinopathies.

Hyperplastic Cholecystoses

S. I. MARGULIES, MD
B. G. BROGDON, MD

In 1960, Jutras[1] described a group of nonmalignant noninflammatory gallbladder conditions having related pathologic, physiologic, and radiologic changes. He suggested the term *hyperplastic cholecystoses* to encompass these entities—cholecystoses, since they seem to be related to an inflammatory process only incidentally; hyperplastic, since they appeared as a disordered result of overwork or as a premature manifestation of senescence.

The major entities included in the hyperplastic cholecystoses are cholesterolosis, adenomyomatosis, and neuromatosis. All are, in a sense, degenerative phenomena; frequently they coexist.

Radiographically, these conditions are manifest on contrast studies by filling defects or abnormal configuration of the gallbladder in association with hyperconcentration, hyperexcitability, and hypersecretion.

CHOLESTEROLOSIS is characterized by multiple mucosal collections or excrescences of cholesterol deposits which may be either diffuse and granular or disseminated and multiple (Fig 1). These cholesterol "polyps" are usually less than one centimeter in diameter and are best seen in the contracted gallbladder, either as notches if seen tangentially or as filling defects if seen *en face* (Fig 2). Ordinarily these polyps maintain a relatively fixed position on the gallbladder wall.

Nonlithic filling defects of the gallbladder are differentiated from stones by virtue of their peripheral location and relative lack of mobility. In the differential diagnosis of the various nonlithic filling defects, one must consider cholesterol polyps, true adenomas (papillomas), and inflammatory polyps. Cholesterol polyps are the most common. They are usually multiple and vary from 2-6mm in greatest diameter. Adenomas are rare and are usually solitary, measuring 3-8mm. Inflammatory polyps are even more rare and are associated usually with severe cholecystitis, which virtually precludes radiographic visualization of the gallbladder. Therefore, the visualization of multiple, small peripheral, fixed filling defects of varying size and uneven distribution should lead to the almost certain diagnosis of cholesterolosis. Conversely, a single fixed filling defect of less than one centimeter is still most often a cholesterol polyp but may represent a true adenoma.[1-3]

ADENOMYOMATOSIS is characterized microscopically by mucosal and muscular hyperplasia in which mucosal villi branch beneath the mucosa and pouch through the muscularis to form diverticula called Rokitansky-Aschoff sinuses. With radiographic contrast studies, the gallbladder is well visualized; its walls are interrupted by multiple small diverticula seen in profile (Fig 3). Often there is narrowing or stricture of the gallbladder where the diverticula are most numerous. A careful evaluation of stricture or septum formation within the gallbladder will often allow the diagnosis of adenomyomatosis to be made. The adenomyomatous "septum" or stricture may be located anywhere in the gallbladder and is usually more than 2mm in thickness, thus differentiating it from the Phrygian cap or the postural kink[4] (Fig 4).

The Rokitansky-Aschoff sinuses associated with the hyperplastic cholecystoses may predispose to stone formation by stasis and hypercon-

From the Department of Radiology, The Johns Hopkins Hospital. This work was supported in part by USPHS Grant No. 5T1-GM-1328.

centration of bile with a secondary inflammatory response. The sinuses may not be appreciated radiographically until after contraction of the gallbladder following fatty meal stimulus.

A separate form of adenomyomatosis is the solitary adenomyoma, a fundal lesion with no neoplastic potential. When the gallbladder is distended, the mass is usually extraluminal and thus not evident. With contraction of the gallbladder, the mass projects into the lumen as a rounded intraluminal or intramural filling defect, and diverticula may be seen at that time[1, 5] (Fig 5).

NEUROMATOSIS is a non-neoplastic proliferation of the nerve fibers of the gallbladder. This lesion is quite common and is frequently

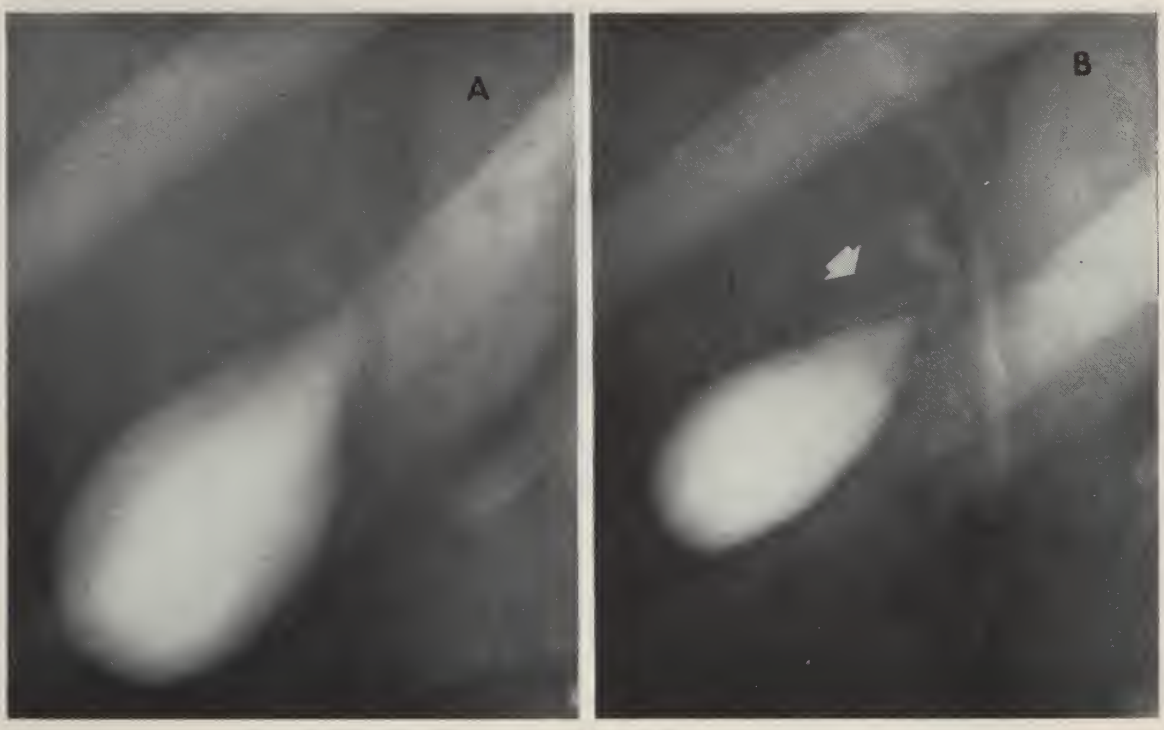

Fig 3
Adenomyomatosis: Before stimulation (a) diverticula poorly visualized. After stimulation (b) diverticula fill with contrast media and are visible (arrow).

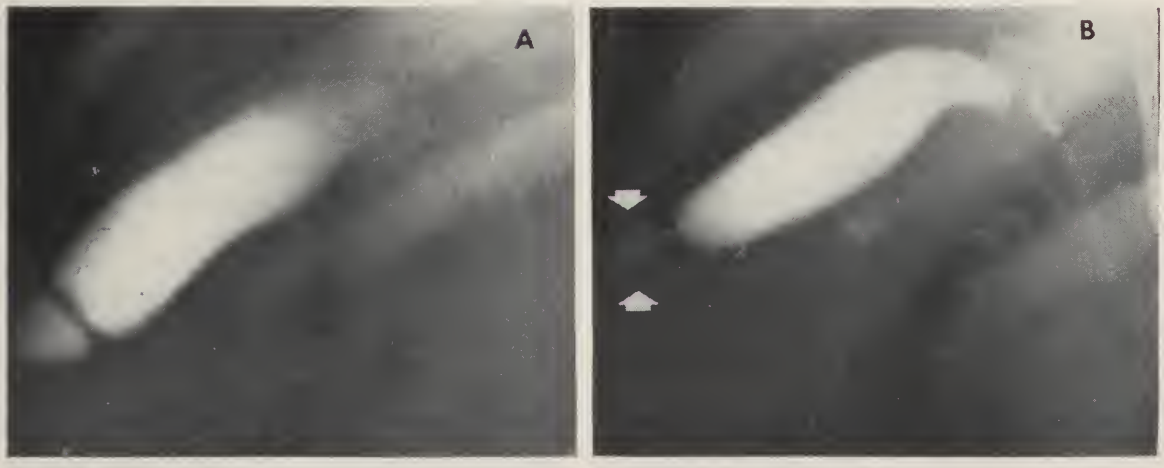

Fig 4
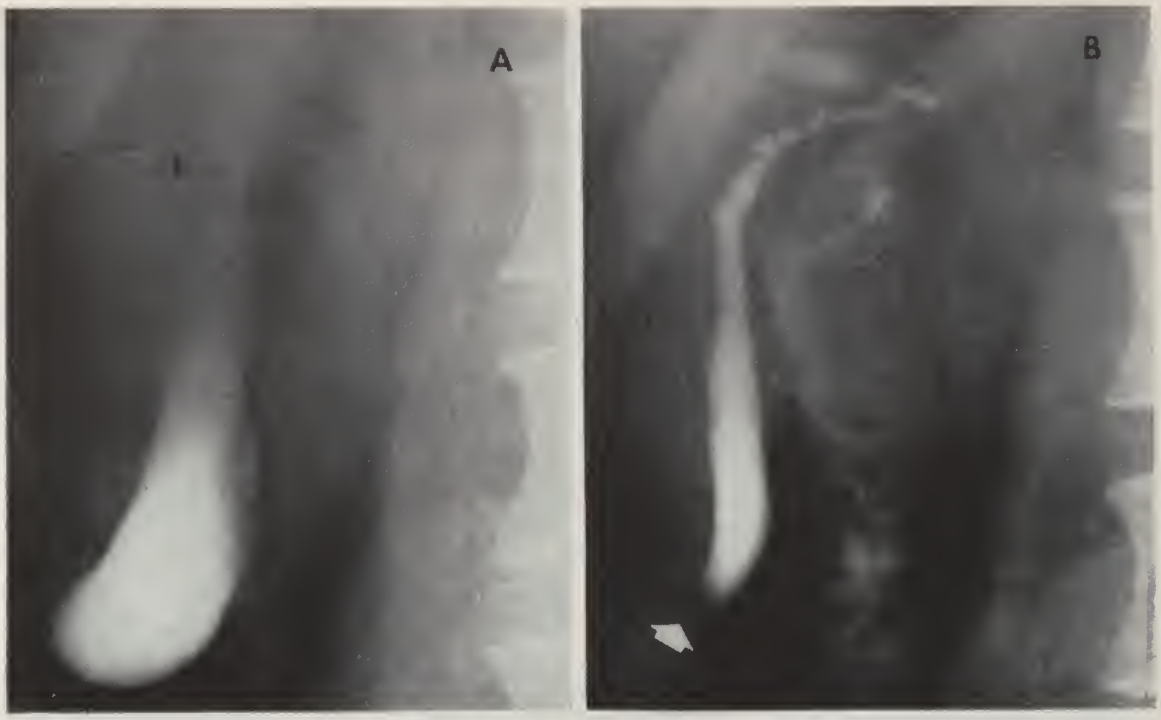
Hyperplastic cholecystoses (adenomyomatous septum) before (a) and after (b) fatty meal stimulus. Note thickness of septum and greater contraction of distal loculus than of proximal one after stimulation (arrow).



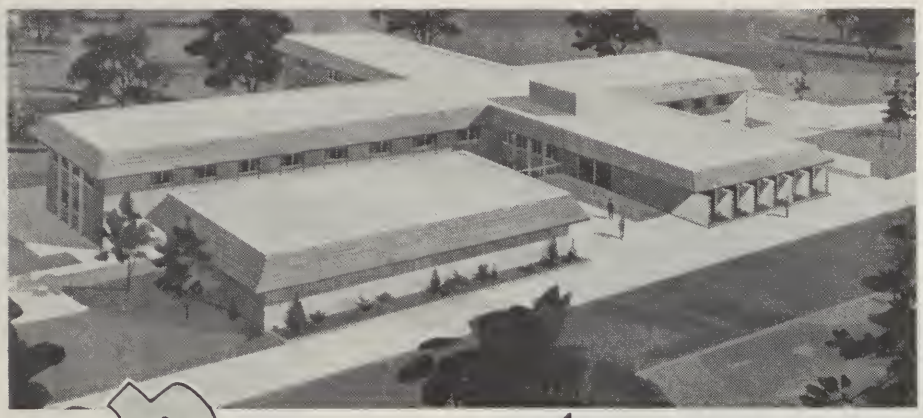


Fig 5
Fundal adenomyoma: Before stimulation (a) defect is extraluminal and not seen. After stimulation (b) defect becomes intraluminal (arrow). Note also hyperconcentration and hyperevacuation.

associated with other manifestations of the hyperplastic cholecystoses. Radiographically, neuromatosis is evidenced by hyperexcitability of the gallbladder, that is, by an unusually strong contractile response to stimulation. The presence of a superimposed neuromatosis probably explains the intense pain experienced by many patients with cholesterolosis or adenomyomatosis.[1]

RADIOGRAPHIC FINDINGS in the hyperplastic cholecystoses are not limited to observation of the filling defects or diverticula that correspond to the morphologic abnormalities. The functional radiographic findings due to the pathologic physiology involved are similarly striking. The mucosal hyperplasia causes an increase in the speed and intensity of concentration of contrast media: the neural hyperplasia produces an acceleration in response to stimuli; and the muscular hyperplasia initiates an exaggerated contractile response leading to rapid and excessive evacuation.[1] In more than 80% of patients with hyperplastic cholecystoses, the opacified gallbladder will be as dense as, or more dense than, the adjacent skeletal structures.[1] Frequently the hepatic and common bile ducts are visualized after the fatty meal.

Many patients with hyperplastic cholecystoses will have biliary calculi which will, to some extent, confuse the radiographic diagnosis and clinical management of their basic disease.

CLINICAL MANAGEMENT depends upon the presence or absence of biliary calculi and the severity of symptoms. The presence of stones usually is an indication for a cholecystectomy. Hyperplastic cholecystoses producing severe symptoms in the absence of stones probably is a valid indication for cholecystectomy; it frequently relieves symptoms.[6] Since the hyperplas-

tic cholecystoses have no increased malignant potential, surgery is not imperative for the mildly symptomatic or asymptomatic patient. Although the policy of careful observation is well accepted,[3, 7] the occasional solitary cholesterol polyp may be operated upon since it cannot be differentiated with certainty from the true adenoma, which may have some potential for malignant degeneration.[2, 8]

Summary

The hyperplastic cholecystoses are a group of gallbladder conditions that are proliferative and degenerative rather than inflammatory or neoplastic. They are a manifestation of overwork or premature senescence of gallbladder tissue. The hyperplastic cholecystoses most commonly encountered are cholesterolosis, adenomyomatosis, and neuromatosis.

Radiographically, they are characterized by fixed, small filling defects, diverticula formation, or fundal defects in association with the functional triad of hyperconcentration, hyperexcitability, and hyperevacuation.

Clinical management depends upon the severity of symptoms and the presence or absence of gallstones. The probability of malignant degeneration is no higher than for that of a normal gallbladder.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslan Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

PKU LAWS, A MODEL FOR THE FUTURE?

SAMUEL P. BESSMAN, MD

Testing of children at, or shortly after, birth for mental retardation is a desirable objective if the test is reliable, and the therapy is not implied by law, and if we can be confident that no injury is done to children who are mistakenly diagnosed.

On November 21, 1965, as part of the 75th Anniversary Celebration of the Rosewood State Hospital, a panel of distinguished scientists considered biochemical problems in mental retardation. Dr. George Donnell reviewed studies in galactosemia, Dr. Alfred Knudson analyzed various genetic aspects of mental retardation, and Drs. George Jervis and Mary Efron discussed recent developments in diagnosis and treatment of phenylketonuria.

Some questions were raised during the talks on phenylketonuria and the question period afterwards tended to emphasize the growing misgivings of the medical community concerning this disease.

1. What evidence do we have that excess phenylalanine causes the mental retardation in phenylketonuria?

2. What evidence do we have that a child born with a high content of phenylalanine in his blood will be mentally retarded if he is not treated?

3. What are the blood test values to be designated as positive or negative for potential mental retardation? Dr. Efron suggested 20 mg% of phenylalanine as the lower limit of positive diagnosis, but Dr. Jervis and others mentioned lower and less exact standards, because there are no clear data.

4. What are the social implications for a family which is told that its child is potentially mentally retarded?

5. How effective is the restrictive diet in preventing mental retardation?

There are at present no unequivocal, or even scientifically valid answers to any of these questions, yet the public has been convinced that solid proof exists, and, on the basis of this impression, about 32 states have passed legislation, in most cases compelling evaluation of children by some chemical test.

The testing of children at, or shortly after, birth for mental retardation is a desirable objective if the test is reliable, and the therapy is not implied by law, and if we can be confident that no injury is done to children who are mistakenly diagnosed.

Unfortunately, at the present time it is not clear that any of these conditions are fulfilled. There is no assurance that a child who is born with a high blood phenylalanine will continue to have this high level throughout life. Both Dr. Efron and Dr. Jervis reported early variable and falling levels in a large number of children. The validity of the blood phenylalanine level as a gauge of the degree of mental retardation is very poor, and more and more children with normal mentality are being found who have had high blood phenylalanine levels throughout life. The numerical values obtained by different tests differ, the quality of the laboratories varies remarkably, and there is no consensus about what blood content of phenylalanine is diagnostic by any test. The only defensible statement which could be made at the present time would be:

This child was found to have a large amount of phenylalanine in its blood by two different tests. Phenylalanine might cause mental retardation because it is found in excess in the blood of ½ of 1% of mentally retarded children. Animal experiments may or may not show that phenylalanine is toxic for they are

K. Merrill Sumey, Resident Manager

not conclusive. If we deprive this child of phenylalanine to the extent that his blood content drops to a range which we have not yet determined or agreed upon, we hope we can get information that we have prevented the mental retardation which the child may or may not get if he is not treated.

The most unusual aspect of the new laws is the legal assumption of the relation between a chemical test and the psychologic diagnosis of mental retardation. This would be serious if it were simply a problem of phenylketonuria, which is rare in itself, and only a minor cause of mental retardation. It becomes grave in its import when we note that the phenylketonuria programs are being offered as a model of legislation relating to many, if not all, forms of retardation "detectable" at birth.

Proponents of the mass testing programs claim that they will lead to new knowledge. As they are now constituted, PKU testing and treatment programs are unlikely to yield data of scientfic value. If we deprive all children found with excessive amounts of one amino acid or other then we shall have no knowledge of the course or natural history of disease. We shall claim "cures" for diseases which may never have occurred.

Doctors do not dare to withhold deprivation therapy unless they see severe growth failure or other clear evidence of immediate danger. The recent judgment obtained against those who did not diagnose and "treat" phenylketonuria is a case in point.

Surely, the poliovirus vaccines were far better documented and the prize far greater, but the approach has been more deliberate. Millions of children were tested and results were compared in many countries. There is still no law about polio. Much more is known about the biologic basis of heart disease and kidney disease in children than is known about the chemical mechanism of mental retardation, but no legislation has been proposed.

There are two general types of medical legislation—one is the attack on the financial problems of medicine, as exemplified by Medicare. The second is the crystallization into law of criteria for diagnosis and implication of therapy, such as the PKU laws.

It is important in the months ahead, as the drive for federal legislation gains momentum, that we sit back for a moment to weigh the consequences of premature action, both to the child and to society.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown®
(meprobamate)

Indications: Meprobamate is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, meprobamate fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: 'Miltown' (meprobamate) is available in two strengths: 400 mg. scored tablets and 200 mg. coated tablets. 'Meprotabs' (meprobamate) is available as 400 mg. white, coated, unmarked tablets. *Before prescribing, consult package circular.*

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, Commissioner

Highlights

Laboratory Accreditation

The Bureau of Laboratories has been notified of the laboratory's accreditation by the College of American Pathologists, a professional society which conducts the only nationwide program for inspecting and accrediting clinical laboratories. Evaluation is made only when a laboratory is headed by a physician. To date this recognition has been given to only one other state health department laboratory. In order to receive accreditation, the laboratory submitted detailed information in response to a questionnaire; this was followed by an extensive review of all aspects of the laboratory's operations by a pathologist from a large District of Columbia hospital.

Dental Service for Handicapped

Implementation of a federally financed dental service for inpatients and outpatients at Kernan Hospital soon will be effected. Two dentists have been employed for two half days weekly; both have had excellent experience in remedial dentistry for physically and mentally handicapped children. A clerical-dental assistant is being sought to work three days a week.

Start of the project is pending the purchase of necessary specialized dental equipment and some structural changes in the hospital in which the dental facility is established.

Health Referrals for Military Rejectees

The Department is conducting a federally financed program to provide health referrals for young men who are medically disqualified for induction into the Armed Forces. A Health Department counselor informs the military rejectees of the examining physicians' diagnoses and endeavors to see that they are evaluated by their own private physicians, rather than through various local health facilities, in order to maintain the continuity of doctor-patient relationships. If necessary, referral to local health resources is suggested for rejectees who do not have private physicians, who do not understand the nature of their health problems, or who do not realize the importance of seeking necessary treatment or medical advice.

In a direct mailing and through the *Maryland State Medical Journal*, the Department is requesting private physicians who are consulted by the military rejectees to relay information needed for the compilation of statistics and the evaluation of the program's effectiveness. All information on individual cases will be considered confidential.

Chronic Disease Hospitals

Francis J. Borges, MD, a senior member of the University of Maryland Medical School faculty, has accepted the position of chief of medical and professional services at Montebello State Hospital. He will be responsible for patient care, teaching programs for residents and medical students, and research activities. It is hoped that the residency program at Montebello can begin on September 1, 1966.

A contract has been signed between Montebello State Hospital and the University of Maryland School of Nursing, providing for use of facilities at Montebello for teaching all aspects of

Industrial Health

Personnel from the Division of Occupational Health cooperated with the Prince George's County Health Department in the investigation of a case of poisoning by cadmium oxide fumes. Work was being done in a small, unventilated room in the back of a gun shop, and the exposure occurred while the sights were mounted on rifle barrels using cadmium bearing silver solder.

PENTID®-SULFAS FOR SYRUP

SQUIBB BUFFERED PENICILLIN POWDER WITH SULFADIAZINE, SULFAMETHAZINE, AND SULFAMERAZINE

the fruit punch that packs a wallop

Pentid-Sulfas for Syrup is a real knock-out when it comes to good taste. And, with a single prescription, you provide an anti-infective that combats both gram-positive and gram-negative bacteria. Notable for its economy, Pentid-Sulfas for Syrup is everybody's choice, patient, parent and physician.

Contraindications: Contraindicated in patients sensitive to sulfa or penicillin, pregnant females at term, premature infants, newborns during first week of life. **Precautions:** Watch for hypersensitivity reactions and overgrowth of nonsusceptible organisms. Observe usual precautions for sulfonamide therapy: adequate fluid intake; force fluids if urine volume is low; maintain urinary pH of 7 or higher; use only after critical appraisal in patients with liver or renal damage, urinary obstruction, blood dyscrasias. **Adverse Reactions:** Anaphylactoid shock (rare), G.I. disturbances, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, urticaria, purpura, hematuria, crystalluria, conjunctival and scleral varicula, petechiae may occur. **Dosage:** Daily pediatric dosage should supply 65-100 mg. trisulfapyrimidines per pound body weight in divided doses q. 4 to 6 h. **Supply:** Pentid-Sulfas for Syrup when prepared, provides 80 cc. (16 doses) or 150 cc. (30 doses) of fruit-flavored syrup providing in each 5 cc. teaspoonful 125 mg. (200,000 u.) potassium penicillin G and 167 mg. each of sulfadiazine, sulfamethazine, and sulfamerazine.

Now . . . **NEW PENTID® '400'—SULFAS FOR SYRUP** (buffered penicillin powder with sulfadiazine, sulfamethazine, and sulfamerazine each 5 cc. providing 250 mg. [400,000 units] potassium penicillin G and 167 mg. each of sulfadiazine, sulfamethazine, and sulfamerazine). Available in 16-dose (80 cc.) and 30-dose (150 cc.) bottles.

Rabies Control

In the recent Vaccination Days for Dogs, conducted on May 15 and May 22, 20,479 canines received anti-rabies vaccine in the Baltimore metropolitan area. In Baltimore City, 6,009 animals were protected.

The rabies control program was a coordinated project of the Maryland Veterinary Medical Association, the Maryland State Department of Health, and the local health departments of Baltimore City, Anne Arundel, Baltimore, Carroll, Harford, and Howard counties. In view of periodic reports of rabid animals in Maryland, the possibility of having a human case is always present. Physicians are reminded that all cases of dog bite or other animal bites are to be reported to the Baltimore City Health Department, telephone 752-2000, extension 312.

Mr. Sachs Promoted

Mr. C. Edward Sachs has been promoted to director of the Bureau of Environmental Hygiene in the Baltimore City Health Department. He will supervise the activities of the Division of Community Sanitation and the Division of Rodent Control. This administrative position has been vacant since the death of Mr. George O. Motry on November 4, 1965.

Mr. Sachs, a native of Baltimore, attended Baltimore schools and graduated from the Johns Hopkins University, where he engaged in both pre-medical and civil engineering studies. In 1943 he became a senior sanitary inspector in the Division of Housing, then a subdivision of the Bureau of Environmental Hygiene. After a year's military service in 1945 and 1946 as an administrative specialist in the U.S. Army Air Force, he returned to the Bureau of Environmental Hygiene as sanitarian.

In 1952 Mr. Sachs transferred to the Bureau of Industrial Hygiene and in 1956 was promoted to chief of the Division of Industrial Hygiene Investigations. Later, after successive advancements, he became principal public health engineer in the Division of Air Pollution Control, where he was responsible for supervising the air pollution control work of the department.

Mr. Sachs performed important work in air pollution surveys before the Harbor Tunnel was built and more recently has assisted in the planning and conduct of the Metropolitan Air Quality Survey Program now in progress. He is a member of the National Association of Santitarians, the National Air Pollution Control Association, the American Association of Sanitarians, and the Maryland Public Health Association.

BALTIMORE, MD. 21218

Many anxious patients need more than just calming.

Stelazine®

brand of trifluoperazine

offers true tranquilization.

Sedative or muscle relaxant-type tranquilizers are often all that's needed for patients with temporary situational anxiety. But in the many patients whose anxiety presents a continuing problem these agents are limited by their generalized dulling effects.

'Stelazine' can attack anxiety directly without producing annoying dulling effects. On 'Stelazine', patients can react more normally to day-to-day stress yet remain alert, able to carry on their normal activities.

Contraindicated in comatose or greatly depressed states due to CNS depressants and in cases of existing blood dyscrasias, bone marrow depression and pre-existing liver damage. *Principal side effects,* usually dose related, may include mild skin reaction, dry mouth, insomnia, fatigue, drowsiness, dizziness and neuromuscular (extrapyramidal) reactions. Muscular weakness, anorexia, rash, lactation and blurred vision may also be observed. Blood dyscrasias and jaundice have been extremely rare. Use with caution in patients with impaired cardiovascular systems. Before prescribing, see SK&F product Prescribing Information.

SK&F Smith Kline & French Laboratories, Philadelphia

STATE OF MARYLAND

Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, Statistics Director

A Report to the 15 Southern States

The southern states* have made substantial progress in recent years in providing improved hospital services for their mentally ill; yet they still lag appreciably behind the rest of the United States, according to statistics published by the Office of Biometry of the National Institute of Mental Health.

Total hospital maintenance expenditures by the 15 states nearly doubled in this nine-year period (from $110,000,000 in 1956 to $215,000,000 in 1965), and average daily per patient expenditures are now more than twice the 1956 figure. However, since comparable changes have occurred in the other 35 states, the South's relative position has remained essentially unchanged. In fact, the South's daily average in 1965 of $4.96 was exceeded by at least 10% by each of the other 35 states. Available statistics indicate similar variations in the facilities for the mentally retarded.

Average Daily Per Patient Expenditure	15 Southern States	Rest of United States	Percent Difference
1956	$2.37	$3.53	—32.7
1959	3.11	4.66	—33.3
1962	3.91	5.91	—33.8
1965	4.96	7.30	—32.1
Number of Employees For Every 100 Patients			
1956	23.6	28.9	—18.3
1959	26.9	33.9	—20.5
1962	31.4	37.8	—16.9
1965	37.1	43.2	—14.1

This disparity does not reflect a lesser interest and support for mental hospital programs. Rather, it is related to the relatively lower economic level of most southern states. Latest figures released by the U.S. Department of Commerce indicate that per capita income in the South continues to be one-fourth lower than in the rest of the United States. This in turn has produced lower than

*Alabama, Arkansas, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia.

average per capita expenditures for all state services.

The South has been characterized as an area in transition. Gradual economic and social development can be expected to produce in the mental health field a concomitant continuation of the progress experienced in recent years. However, unless this is rapidly accelerated, much of the South will perpetually lag behind the rest of the United States.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

The accompanying photo was taken during the semiannual meeting of the Maryland Association of Medical Assistants, which was held at the Sheraton-Belvedere Hotel on April 30.

Jose Martinez, MD, on the left, gave the welcoming address. Dr. Martinez is instructor in medicine and lecturer in the Department of Public Health Administration, Johns Hopkins University. He is also consultant in nuclear medicine for the Veterans Administration and associate director, Health and Welfare Fund, Amalgamated Clothing Workers of America. Dr. Martinez has given several talks on radioisotopes, before both the Maryland and the Washington Associations of Medical Assistants. His contributions have been most valuable.

Raymond Atkins, MD, center, was master of ceremonies at the banquet which followed the educational seminar. Dr. Atkins is assistant director of medical education at Church Home and Hospital, instructor in surgery and clinical anatomy at the University of Maryland, and instructor in the Outpatient Vascular Clinic, Johns Hopkins Hospital. He taught a class in anatomy and physiology for the medical assistants last year, which added much to the educational background of those attending. This course was particularly helpful to those members who took the examination for Certified Medical Assistant in June.

Dr. Atkins was appointed advisor to the Maryland Association of Medical Assistants for 1966 and 1967 by the Medical and Chirurgical

Faculty of Maryland. His term of office began at the meeting on April 30. The entire membership appreciates his willingness to accept this responsibility.

Jack Zimmerman, MD, on the right, was a speaker during the afternoon seminar. His subject was "Cardiac Pacemakers." Dr. Zimmerman is chief of surgery and director of medical education at Church Home and Hospital and associate professor of surgery at Johns Hopkins University. Dr. Zimmerman also has contributed to our meetings by acting as master of ceremonies at the banquet and installation ceremonies of the Baltimore City chapter of Medical Assistants on "Bosses' Night" in January. His ready wit makes him an ever-welcome addition to our gatherings.

Eleanor Scott, MD, chief of obstetrics at Church Home and Hospital, gave a most illuminating talk on "The Use of the Vacuum Extractor in Obstetrics." This is a fairly new development, and Dr. Scott's talk was particularly interesting to the many obstetric assistants in the audience.

Mr. Jerome Wilkenfeld, of the Hooker Chemical Corporation in Niagara Falls, NY, spoke on "Air Pollution," a topic of timely interest.

Captain Frank Voris, of the Medical Corps, U. S. Navy, gave a fascinating glimpse into the future of medicine through his work with space medicine and the medical programs connected with our astronauts and space explorations. He showed three memorable films, one of the "Walk in Space" and two official films of the NASA showing the Rendevouz in Space and the aborted Agena flight.

After the banquet, an installation ceremony for new officers was held. Officers are: president, Miss Betty Fern, secretary for Dr. Harry Kelmenson; president-elect, Mrs. Nell Chaney, secretary for Dr. Jack Zimmerman; secretary, Mrs. Lottie Wolfson, secretary to Dr. A. Cole; treasurer, Mr. John Komber, laboratory technologist for Dr. Henry Wollenweber.

Russell Fisher, MD, past advisor of the MAMA, initiated a standing ovation for the retiring president, Mrs. Katherine Kousouris, secretary for Dr. Charles Doeller. Under her leadership, many changes and gains in membership were accomplished.

Bamadex® Sequels®

Contraindications: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised; especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of pre-existing symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dose—operation of motor vehicles, machinery or other activity requiring alertness should be avoided. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia, the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor, and respiratory collapse.

Bamadex® Sequels®

d-amphetamine sulfate (15 mg.) and meprobamate (300 mg.)
Sustained Release Capsules

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients makes possible convenient one-capsule-a-day dosage.

The discomforts of

DIARRHEA
MUCOUS COLITIS
DIVERTICULITIS
SPASTIC URETERITIS
BLADDER SPASM

are relieved by direct musculotropic action with.....

Trocinate®

BRAND THIPHENAMIL HCl

Available in 100 milligram pink sugar-coated tablets.

The high therapeutic index permits dosage sufficient to relieve spasm promptly. The usual initial dose is 4 tablets. Maintenance dosage is usually one or two tablets 4 times a day.

Trocinate *BRAND* THIPHENAMIL HCl
BETA-DIETHYLAMINOETHYL DIPHENYLTHIOACETATE HYDROCHLORIDE

Directly relaxes smooth muscle spasm
Combats hypermotility
Non-mydriatic, may be used in glaucoma

Trocinate (Thiphenamil HCl) has been found in three clinical studies, (J. Mo. Med. Assoc., 48:685-6; Med. Rec. & Annals, 43:1104-6; J. Urol., 73:487-93), to be effective and to be virtually free of side-effects. Fifteen years of wide clinical usage has affirmed the safety and effectiveness of Trocinate.

The MISSING LINK in Weight Control

Diet Control — **Appetite Control**

and now finally
. . . the neglected factor

Ex-Caloric Wafers *

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

)ESCRIPTION:
rtificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking gents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients laced on a restricted reducing diet. Usual daily intake less than 3 calories per day.

ACTION:
x-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness or those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived f their between-meal snacks.

ADMINISTRATION:
or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of wafer must be taken vith each dose.

CONTRAINDICATIONS:
x-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese atients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

when anxiety is part of the clinical picture

Librium®
(chlordiazepoxide HCl)

In prescribing: Dosage — Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to o.i.d.
Side Effects: Side effects, usually dose-related, include drowsiness, ataxia, minor skin rashes, edema, menstrual irregularities, nausea and constipation. When treatment is protracted, blood counts and liver function tests are advisable. Paradoxical reactions may occasionally occur in psychiatric patients. Individual maintenance dosages should be determined.
Precautions: Advise patients against possibly hazardous procedures until maintenance dosage is established. Though compatible with most drugs, use care in combining with other psychotropics, particularly MAO inhibitors or phenothiazines; warn patients of possible combined effects with alcohol. Observe usual precautions in impaired renal or hepatic function, in long-term treatment and in presence of depression or suicidal tendencies. Exercise caution in administering drug to addiction-prone patients or those who might increase dosage; withdrawal symptoms, similar to those seen with barbiturates or meprobamate, can occur upon abrupt cessation after prolonged overdosage. Caution should be exercised in prescribing any therapeutic agent for pregnant patients.
Supplied: Capsules, 5 mg, 10 mg and 25 mg, bottles of 100.

to help restore and stabilize the intestinal flora

LACTINEX®

TABLETS & GRANULES

for fever blisters and canker sores of herpetic origin

LACTINEX contains a standardized viable mixed culture of *Lactobacillus acidophilus* and *L. bulgaricus* with the naturally occurring metabolic products produced by these organisms.

LACTINEX was introduced to help restore the flora of the intestinal tract in infants and adults.[1,2,3,4]

LACTINEX has also been shown to be useful in the treatment of fever blisters and canker sores of herpetic origin.[5,6,7,8]

No untoward side effects have been reported to date.

Literature on indications and dosage available on request.

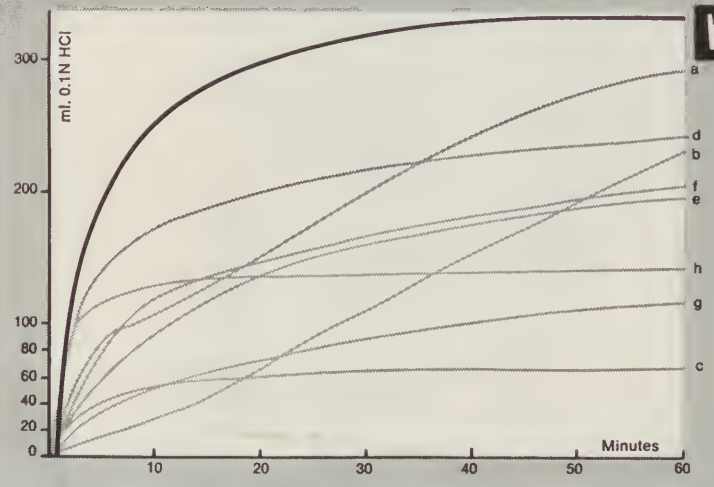
Winthrop announces new WinGel®

ANTACID TABLETS AND LIQUID

For peptic ulcer, gastric hyperacidity, gastritis

Each WinGel tablet or teaspoon (5 ml.) contains 410 mg. of combined, highly reactive, short polymer, aluminum and magnesium hydroxides **stabilized with hexitol.**



Neutralizes 300 times its active-ingredient weight in gastric acid for fast, long-lasting relief

Gastric or duodenal ulcer, acute or chronic gastritis, gastric hyperacidity...wherever there is "acid overflow" new WinGel can provide faster, longer, more complete neutralization.

In recent laboratory comparisons* with eight other leading antacids, new WinGel tablets not only neutralized more hydrochloric acid per active-ingredient weight, but neutralized it faster and longer than all other antacids tested.

Pleasant pink in color, WinGel is delicately mint flavored with a smooth-as-cream texture—qualities sure to please the patient on long-term therapy. New WinGel is also specially formulated to avoid constipation or diarrhea.

New WinGel neutralizes 300 times its active-ingredient weight in 0.1N hydrochloric acid—neutralizes more acid faster than other leading antacids

Rate of 0.1N hydrochloric acid neutralization at pH 3.5 and 37° with WinGel and eight other leading antacid tablets—*in vitro*. Samples equaled the weight of tablet material containing 1.0 Gm. active ingredients.*

*Hinkel, E. T., Jr. (New York): Data in the files of the Department of Medical Research, Winthrop Laboratories.

Dosage: Peptic ulcer or gastritis—from 2 to 4 teaspoons of WinGel liquid or 2 to 4 tablets chewed or allowed to dissolve in the mouth every two to four hours. **Gastric hyperacidity**—2 tablets or teaspoons about ½ to one hour after meals as needed; children from 7 to 14 years of age, 1 or 2 tablets or 1 or 2 teaspoons of liquid as needed.

How Supplied: Liquid in bottles of 8 fl. oz. and 1 pint. **Tablets** in cellophane strips, boxes of 50 and 100. (One teaspoon of WinGel liquid is equivalent to one WinGel tablet in acid-combining capacity.) WinGel, trademark reg. U.S. Pat. Off.

Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Finally — a taste your patients will truly like

So I said, "All right, Raymond, if you don't take your cough medicine this minute, I'll call Doctor Peabody."

Controlling the child is sometimes as big a problem as controlling his cough. But with most children and with most coughs, the job is usually much easier with one of these effective Novahistine formulas.

If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.

Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

EXECUTIVE SECRETARY'S NEWSLETTER

August, 1966

IT'S NOT TOO LATE!!

It's not too late to make your reservation for the Semiannual session on September 9, 1966. Fun for all at the Diplomat Motel, Ocean City. If the Diplomat can't accommodate you, arrangements have been made for your reservation to be sent to nearby motels.

COMING EVENTS

**** TRAFFIC SAFETY**

An all-day Seminar on the Medical Aspects of Traffic Safety is scheduled for **Wednesday, October 12, 1966.** Gubernatorial candidates, the Governor and others have already indicated their acceptances to appear on the program. Full details will be sent to all members shortly.

**** MEDICAL ETHICS**

An all-day session on Medical Ethics has also been scheduled for Saturday, October 15, at the Med-Chi Building. Primarily aimed at residents and interns who obtain very little of this during their student days, the sessions are open to all members.

Topics will range from "The Ethical, Legal and Moral Responsibilities" of physicians to a panel which will discuss "On Entering Practice."

Full details to all members shortly.

PLEASE TAKE NOTE

It has been brought to the attention of the Faculty office that physicians throughout Maryland are being solicited for $58.00 for a "listing in a Classified Directory."

This company, based in California, operates within the confines of the law in all states throughout the country. A careful perusal of the "invoice" indicates that it is a "solicitation", and not a "bill, invoice or renewal".

Physicians are cautioned against believing that this represents an organization officially recognized by medical groups. Physicians are also cautioned that the Medical Practice Act of Maryland prohibits advertising of any sort by physicians.

NEW LABORATORY RULES AND REGULATIONS

New rules and regulations for laboratories in Maryland have been published and are effective on October 1, 1966.

In essence, certain standards and educational qualifications will be required of personnel operating such establishments.

Physicians are reminded of the ethical standards established by the Faculty in connection with services offered by laboratories. It is our understanding that a representative of the U. S. Senate Antitrust and Monopoly Committee is now conducting an investigation of laboratory operations in Maryland to ascertain:

ANTITRUST INVESTIGATION

1. Which, if any, physicians bill for services not actually performed in their offices and by their own personnel.

2. Which physicians, if any, have a "contract" arrangement with laboratories whereby they pay a flat rate per month to the laboratory for an unlimited amount of services and, in turn, bill the patients for these services.

3. Physicians who are or have permitted their names to be used as a "front" for so-called lay laboratories.

NEWS NOTES

Pediatricians whose names are not on the rolls of the Maryland Pediatric Society are urged to contact the current secretary, Clewell Howell, M.D., 102 Allegany Ave., Towson 21204. Members of this group who have recently moved are also asked to advise the Secretary of their new addresses.

John C. Harvey, M.D., was named Professor of Medicine in the Johns Hopkins University on July 1.

New Diplomates of the American Board of Anesthesiology include Yavuz V. Kent, M.D., Pikesville; and George H. Friskey, M.D., Baltimore.

September 9—Semiannual meeting, Medical and Chirurgical Faculty of the State of Maryland, Ocean City.

THE MARYLAND-DISTRICT OF COLUMBIA SOCIETY OF ANESTHESIOLOGISTS

Annual meeting, Sunday, September 18
U. S. Naval Medical Center, Bethesda

PROGRAM

1:30 PM annual business meeting

2 PM "*PRACTICAL PULMONARY PHYSIOLOGY*"

Sol Katz, MD, chief, Medical Service, Veterans Administration Hospital, Washington, DC; professor of medicine, Georgetown University School of Medicine.

Peter C. Luchsinger, MD, chief, Cardiopulmonary Physiology Research, Veterans Administration Hospital, Washington, DC; associate professor of medicine, Georgetown University School of Medicine.

Hall G. Canter, MD, assistant chief, Medical Service, Veterans Administration Hospital, Washington, DC; assistant professor of medicine, Georgetown University School of Medicine.

Donald P. Schilder, MD, director, Emphysema Unit, Veterans Administration Hospital, Washington, DC.

4-5 PM cocktails

5 PM buffet dinner

MARYLAND STATE DENTAL ASSOCIATION

September 18-21
Lord Baltimore Hotel

Four speakers (one half hour each) will talk on timely dental topics each day. In addition 30 table clinics will be presented. On Sunday, September 18, the annual seafood dinner party will be held from 1 to 5 PM at the Oriole Gun Club. The President's Reception and Dance will be held at the Lord Baltimore Hotel on September 19 from 7:30 PM to 1 AM.

AMERICAN COLLEGE OF PHYSICIANS
Postgraduate Courses 1966

The courses run from three to five days and are held in cooperation with medical schools and teaching institutions throughout the United States. The concentrated courses are aimed at providing practicing physicians with formal instruction in new developments affecting the diagnosis and treatment of diseases. The courses are part of the College's continuing education program to help internists keep their medical knowledge and skills current.

The courses are open to all physicians. However, in each case enrollment is limited, and priority is given to members of the American College of Physicians.

September 28-October 1 *Advances in Cutaneous Medicine,* Mayo Graduate School of Medicine, University of Minnesota, Rochester.

October 3-7 *The Care of the Critically Ill Medical Patient,* State University of New York College of Medicine, Syracuse.

November 7-11 *Endocrine and Metabolic Disorders,* The State University of New York, Downstate Medical Center, Brooklyn.

November 14-18 *Newer Aspects of Experimental and Clinical Allergy,* Harvard University Medical School, Boston.

November 28-December 2 *Progress in Gastroenterology,* University of Pennsylvania School of Medicine, Philadelphia.

December 5-9 *What the Internist Should Know About Cancer,* College of Physicians and Surgeons of Columbia University, New York.

December 14-17 *Infectious Diseases,* University of Pittsburgh School of Medicine and Medical Center.

SOUTHERN MEDICAL ASSOCIATION
60th Annual Meeting

November 14-17, Washington, DC

Programs with outstanding speaker in each of the 22 medical specialties.

UNIVERSITY OF MARYLAND SCHOOL OF MEDICINE

POSTGRADUATE COURSES—1966-67

#1 BASIC ELECTROCARDIOGRAPHY
November 10
Designed with the general practitioner of medicine in mind.

#2 EYE, EAR, NOSE & THROAT
December 1
Presenting the practical problems of these two specialties for the general practitioner of medicine.

#3 NEUROPATHOLOGY FOR PATHOLOGISTS
December 5-10
Given at the practical level and including basic neuropathology, trauma, tumors, infections and degenerative diseases; surgical neuropathology; the neurological clinicopathological conference; and practical drill in cutting, blocking, staining, and microscopic study of provided specimens.

#4 SURGICAL PHYSIOLOGY
December 15
Preoperative and postoperative physiology, functional derangements, and management of the clinical problems commonly presented by the surgical patient will be discussed.

#5 ADVANCES IN MEDICAL SCIENCE
January 11-April 15
(Wednesdays, 3-5 PM)
Designed for physicians in practice who wish to keep abreast of the important advances in medical science. Emphasis is placed on a basic scientific approach to an understanding of the more common clinical problems and their management.

#6 DERMATOLOGY
January 19
A clinical session in which many dermatologic disorders will be seen and examined by the attending physicians, followed by presentation and discussion of the problems of diagnosis and management of each entity.

#7 CLINICAL ANATOMY
February 1-May 24
(3 hours/day; 2 days/week)
Emphasizing the practical application of anatomy and anatomical principles in physical and x-ray diagnosis. Anatomical knowledge is related to the use of needling in performing diagnostic procedures and in treatment. The course is directed toward both the medical man and the surgeon. It is an aid in preparation for the American Board Examination.

#8 GYNECOLOGY
February 9
Designed to be of interest to both general practitioners and specialists.

#9 DIABETES
March 2
Presenting recent advances of great practical interest in this field.

#10 HEMATOLOGY
March 16
A review of current trends and investigative efforts in selected areas of hematology and their implications, both practical and theoretical.

#11 IN-SERVICE PROGRAM
The enrollee spends a week in pre-selected department, accompanying members of the department on rounds, conferences, clinics, etc. Time is arranged upon application. This course will not be available during the months of May, June, July.

Advance registration is requested on all courses.

Category I Credit of Academy of General Practice is allowed on all courses.

JOHN SARGEANT — EXECUTIVE SECRETARY

COUNCIL, JUNE 9

1. A portrait of the late Edgar B. Friedenwald, MD, presented by his son, was accepted on behalf of the Faculty by the Council Chairman.

2. Henry P. Laughlin, MD, was elected to fill the unexpired term of Richard D. Bauer, MD, as councilor from the South Central District.

3. Approval was given to charging to the Educational Fund expenses in connection with the regional Medicare seminars.

4. Physicians' Defense was approved for members requesting it.

5. The Council was advised of settlement of a case.

6. The resignation of George H. Yeager, MD, as editor of the Journal was accepted with regret and expression of appreciation for his many years of service.

7. Approval was given to the proposed immunization program of the State Health Department with the following stipulations: 1) that only the measles vaccine be provided free; 2) that the publicity program will encourage the public to obtain the immunizations from their family physician and not state that they are available without charge from the State Health Department clinics. It is understood that the approval is limited to measles, DPT, smallpox, and polio vaccines and that the Health Department will specify the exact type of measles vaccine to be used.

8. A recommendation that funds be allocated to reimburse speakers for travel expenses to meetings in distant points of the state was denied.

9. A recommendation asking Blue Cross to provide benefits for care of patients with chronic respiratory disease in approved specially equipped nursing homes was ratified.

10. A recommendation that tuberculosis hospitals in the state institute treatment of alcoholism in their alcoholic patients was adopted.

11. The recommendation that renegotiation of the Dependents Medical Care contract be made only on the basis of usual and customary fees was endorsed.

Opening soon in Prince George Plaza

12. A recommendation condemning the practice of various state and local agencies to determine fees paid to physicians without consultation with the medical profession and notifying these agencies of the Faculty's desire to participate in discussing such fees was adopted.

13. A suggestion that the Council and the Executive Committee call upon the Fee Schedule Committee for guidance in matters pertaining to fees in all areas, and particularly in matters dealing with Titles 18 and 19 of PL 89-97, was noted and will be complied with whenever possible.

14. The Council approved the sending of a letter to the State Departments of Health and Mental Hygiene urging that meetings of committees and councils on which Faculty members serve be scheduled at more convenient times.

15. Recommendations of the Program and Arrangements Committee were adopted: 1) that the 1967 scientific sessions be held April 19, 20, and 21 and the House of Delegates meetings on the morning of April 26 and the afternoon of April 29; 2) that a seven-day Caribbean cruise convention be held in conjunction with the 1968 Annual Meeting.

16. A representative from The Johns Hopkins Medical Institutions discussed the question of a branch or satellite hospital in Howard County. A motion was adopted that the President appoint a committee to confer further with Johns Hopkins and other interested parties concerning this; that this does not imply approval of the concept of a closed panel operation; that the Faculty reiterate its policy of favoring free choice of physician over the closed panel plan; and that the desires and previous action of the Howard County Medical Society be considered.

17. A representative from the Eastpoint Medical Center explained its operation and organization. In subsequent discussion, the matter was brought out that the Faculty should make clear at all times its position concerning free choice of physician versus closed panel practice.

18. A resolution was approved asking the Board of Medical Examiners to check with the Faculty and with knowledgeable people in the community before restoring a physician's license or releasing him from probation.

19. A recommendation was approved that all physicians be reminded of the provisions of Federal Trade Commission Rule #7 dealing with acceptance of kickbacks from opticians; also physicians should be aware of the illegality of physician-owned pharmacies.

20. A request from the Med-Chi Insurance Trust to plan a retirement program for Faculty members, in lieu of the Medre program which was adopted but not implemented, was tabled. The Medre Fund is working out details of its own program; however, the Med-Chi Trust might work with the Medre Fund trustees and coordinate activities.

IDENTI-CODE™

(formula identification code, Lilly)

takes the guesswork out of product identification

A special letter-number symbol will appear on each Lilly capsule or tablet. By checking this code against the *Identi-Code™ Index*, you will be able to identify each unit quickly and accurately:

In cases of overdosage

As a safeguard against error or substitution

When medication was prescribed by another physician

When the prescription label is lost

During telephone conversations with patients

Shipments of products bearing Identi-Code symbols are now leaving Indianapolis. Of course, it will be some time before these drugs reach patients. Before they do, you will have received a complete *Identi-Code Index.*

Maryland State Medical Journal
Vol. 15, No. 8
August, 1966

IMMUNIZATION SCHEDULE

Maryland's program of immunization of infants and preschool children has recently received a substantial grant from the Public Health Service under the Vaccination Assistance Act. This grant enables the State Department of Health to supply certain vaccines, personnel, and educational materials for a project aimed at protecting all children against diphtheria, polio, whooping cough, tetanus, smallpox, and measles by the time they are ready to enter school and preferably during the first 15 months of life.

Vaccines which are safe, effective in producing immunity, relatively cheap, easily administered, and which usually do not cause severe systemic reactions are now available for these six diseases. It is believed that when 85% or more of a population has been vaccinated against any one of these diseases, there is little danger of an outbreak. Obviously, high levels of immunity in the population can be reached and maintained only by a continuing program of vaccinations of: 1) the backlog of unvaccinated, especially children of preschool age; 2) children born in the area, beginning when at two months of age; 3) unvaccinated persons moving into the community; 4) booster injections to vaccinated persons at recommended intervals.

Since most of these diseases are more dangerous to children in the first years of life, it is important that the child be given adequate protection beginning as soon after he reaches the age of two months as is convenient and being completed as quickly as is compatible with the recommendations governing the administration of each type of vaccine.

The following schedule is up-to-date insofar as latest available recommendations from recognized authorities are concerned.

Recommended Schedule of Primary Immunizations

Approximate age	Interval between doses	Vaccines	
2 mos.	Start	DPT, OPV[3]	
3 mos.	1 mo.	DPT	
4 mos.	1 mo.	DPT, OPV[3]	
6 mos.	2 mo.	Smallpox	
12 mos.		Measles	
15 mos.		DPT, OPV[3]	Boosters Observing minimum intervals between doses.
5 to 6 yrs. (Before entering school)		DPT, OPV[3] Smallpox	
10 yrs.		DT Smallpox	
15 yrs.		DT Smallpox	

ABBREVIATIONS: DPT—diphtheria, pertussis, and tetanus vaccine. OPV[3]—trivalent oral polio vaccine. DT—adult type diphtheria and tetanus vaccine.

Only well children should be vaccinated.

Oral polio vaccine (OPV) is preferably administered in the fall, winter, or spring months; however, should the child's dose fall due in a summer month and difficulties arise for arranging a return

visit to the physician or clinic, the dose should be given regardless of the season.

The triple vaccine OPV[3] is preferable to the monovalent type.

OPV should not be given to persons who have passed their nineteenth birthday. For these individuals the Salk vaccine should be given in the usual series of three doses and a booster. This rule should be followed in vaccinating pregnant women against polio.

Smallpox vaccine should not be given to children with eczema or any other type of dermatitis or to children whose siblings have a skin disease.

Do not vaccinate children simultaneously with measles and smallpox vaccine, or measles and OPV, or OPV and smallpox. There should be an interval of eight weeks between each of these vaccinations.

Smallpox, measles, or OPV may be given simultaneously with DPT.

DPT is not given beyond the age of 6 years because of the reaction which may be produced by pertussis vaccine. The *adult type* DT should be used for persons 7 years and older.

When a child begins the series of primary vaccinations at an older age than two months, the above schedule may be shortened provided the minimum intervals of one month between doses of DPT and eight weeks between doses of OPV, measles, and smallpox are observed.

If primary DPT series is interrupted for more than six months, the series should be begun again. If the primary OPV[3] series is interrupted for more than the scheduled interval, it is not necessary to begin the series again. Complete the three doses regardless of the time which has elapsed since the last dose, observing the minimum interval of eight weeks between doses. The objective in all vaccinations is to give the child the maximum number of antigens in the shortest allowable time.

The Maryland Immunization Project, with the endorsement of the Medical and Chirurgical Faculty of Maryland, will emphasize particularly immunization against measles during the early months of operation. Special instructions regarding the administration of measles vaccine, issued June 1, 1966, may be obtained from the Division of Epidemiology of the State Health Department or your local health department.

"I like Bronkometer... I breathe better... don't get the jitters."

Patients feel relaxed with Bronkometer. Its bronchodilator-decongestant action has minimal central nervous system stimulation.[1] Isoetharine,* Breon's exclusive bronchodilator, shows only 1/16 to 1/64 the cardiotonic effect of isoproterenol.[2] *Dilabron®, brand of isoetharine

BRONKOMETER® ASTHMA, CHRONIC BRONCHITIS, EMPHYSEMA

isoetharine 0.6%; phenylephrine 0.125%; thenyldiamine 0.05%—Superior because it contains isoetharine

COMPOSITION: Bronkometer delivers at the mouthpiece 200 metered doses of: 350 mcg isoetharine methanesulfonate (0.6%); 70 mcg phenylephrine HCl (0.125%); and 30 mcg thenyldiamine HCl (0.05%) with saccharin, menthol and fluorochlorohydrocarbons as inert propellants. Preserved with ascorbic acid 0.1% and alcohol 30%.

RECOMMENDED DOSAGE: One or two inhalations with at least one minute between inhalations. Occasionally more may be required, however in most cases, inhalations need not be repeated more than every four hours. Dosage should be adjusted to the severity of the condition and to patient's response.

PRECAUTIONS: Bronkometer is unusually free from cardiovascular and other side effects, but the usual precautions associated with sympathomimetic amines should be observed. Bronkometer should not be administered simultaneously with epinephrine or similar compounds because of the possibility of tachycardia, although it may be alternated with these agents. Dosage must be carefully adjusted in patients with hyperthyroidism, hypertension, acute coronary disease, cardiac asthma, limited cardiac reserve and in individuals sensitive to sympathomimetic amines.

SUPPLIED: 10 ml pressurized aerosol vials complete with measured dose valve and oral nebulizer.

ACUTE THROMBOPHLEBITIS AND ITS COMPLICATIONS

JOHN N. CLASSEN, MD
Chief of Surgery, Union Memorial Hospital

ALBERT C. W. MONTAGUE, MD
Associate, Surgical Visiting Staff, Union Memorial Hospital

Acute thrombophlebitis and its complications are often fatal and always incapacitating. Treatment should be directed at prophylaxis. Measures to obviate trauma, overcome stasis, and provide anticoagulant therapy should be instituted in all bedridden cardiac, severely traumatized, and immobilized patients, as well as in those who have had previous attacks of thrombophlebitis. Prophylaxis and therapy are achieved by essentially the same means, but the indications for their use are different. Surgery plays a relatively minor role in the treatment of this disease and its complications. Femoral thrombectomy is indicated in cases of massive ileofemoral thrombophlebitis. Pulmonary thrombectomy may be indicated in cases of massive pulmonary embolism. The postphlebitic syndrome, a distressing but not lethal complication, is best treated by conservative measures. Phlegmasia cerulea dolens should be attacked surgically by thrombectomy followed by anticoagulant therapy.

Acute thrombophlebitis has plagued mankind persistently in the past centuries. In spite of continuous interest in the pathophysiology and clinical manifestations of the disease, there is no evidence to indicate that it is on the decline. On the contrary, Ochsner's[16] statistics show an actual increase of the disease in his clinic. Even more distressing is the fact that in a significant percentage of cases the complication of a fatal pulmonary embolism is the first manifestation of the disease.

Definition.—We shall define the term "acute thrombophlebitis" as any form of intravenous clotting in the deep venous system, with or without endothelial irritation or inflammation. We believe that phlebothrombosis is but a different clinical manifestation of essentially the same pathologic process and hence will not use this term.

The term "acute superficial thrombophlebitis" will be used when referring to thrombosis of the superficial veins.

Etiology.—Endothelial irritation, venous stasis, and hypercoagulability have been recognized since the days of Virchow as the major causes of throm-

Delivered before The Maryland Chapter of The American College of Surgeons, September, 1963.

bophlebitis. There is no evidence to suggest that one of these factors plays a more important role than the others.

Experimentally, one can produce thrombophlebitis by endothelial irritation, whether by mechanical, chemical, or bacterial insults. However, in most clinical cases, a history of such trauma is lacking.

The importance of stasis is well appreciated. Sevitt[20] and Roberts[18] have found that length of hospital stay was a contributing factor to the venous stasis. Byrne[3] attracted the attention of the medical world to the element of heart disease as a common denominator in the production of stasis. Age is also an important factor, producing general debility and consequent prolonged inactivity.

Blood hypercoagulability probably plays a significant role in causing this disease. Physiologic, pathologic, and pharmacologic factors have been incriminated, but the exact mechanism of their action has not been clarified. Ochsner[15] has found the thromboplastin generation test to be helpful in identifying patients predisposed to intravascular thrombosis. Because it is expensive and time consuming, this test is impractical for most hospitals and for most patients.

Symptoms and Signs.—The classical signs and symptoms of acute thrombophlebitis are fever, swelling of the extremity, and pain. The temperature elevation is usually slight and is caused by a pyrogenic response to the breakdown of white cells in the thrombus. Swelling is the most frequent finding and is caused primarily by the thrombus occluding the vein and the associated venospasm. The stasis produces anoxia, capillary permeability, and extravasation of fluid into the tissue spaces. The associated arterial spasm reduces arterial flow, which in turn leads to lymph stasis and more edema. Pain may be severe or merely constant. It is caused by endothelial irritation, venous dilatation, and congestion. Anoxia secondary to capillary stasis and smooth muscle spasm are also contributing factors.

Frequently the disease process is silent; the first indication of its presence may be the manifestation of a complication.

Diagnosis.—The diagnosis of thrombophlebitis is made clinically. Seldom does one receive any help from laboratory or ancillary studies. A classical case of massive swelling of the extremities, calf pain, and low-grade fever is easy to diagnose, but this is the exception rather than the rule. Homan's,[10] Lowenberg's,[11] and Peabody's[17] signs are of some aid, but they are often negative. We firmly believe that every case of unilateral swelling of the lower extremities or postoperative lung infiltrate, even in the absence of other signs, should be considered as evidence of thrombophlebitis unless another cause can be found and treated.

Prophylaxis.—A disease whose clinical course may be ushered in by death in a significant number of cases can be treated effectively only by good prophylaxis. Prophylactic treatment must be directed toward the prevention of hypercoagulability, stasis, and endothelial irritation.

It is not practical to prevent coagulation in all surgical patients, but it is practical to prevent stasis. Many methods have been suggested. Elastic support of the lower leg postoperatively has been popular in many institutions, but its benefit is questionable. McLachlin's[13] papers prove conclusively that elevating the foot of the bed 15 degrees is the best way to avoid stasis. We believe that all beds of surgical patients, even those in the recovery room, should be kept with a 15 degree foot elevation unless the patient's condition contraindicates this. For patients with a failing heart, a 15 degree flexion of the hip is beneficial but not as effective as foot elevation.

Anticoagulation for surgical patients may be indicated in the prophylaxis of thrombophlebitis, but we do not advocate doing this promiscuously or routinely. The indications for its use are: 1) a previous bout of thrombophlebitis, 2) confinement to bed for long periods of time with multiple fractures of the lower extremities or long leg casts, 3) obese patients undergoing major surgery, 4) known cardiovascular disease. Patients in the last group not only are more prone to develop thrombophlebitis but also tolerate emboli poorly. Contraindications to anticoagulant prophylaxis include surgery of the brain and operations requiring extensive dissection.

Treatment of Thrombophlebitis

The aims of treatment are: 1) to bring about the subsidence of acute symptoms of pain and swelling as soon as possible, 2) to limit extension of the disease, 3) to prevent embolization, 4) to minimize the postphlebitic sequelae, and 5) to

avoid recurrence. The approach to treatment is threefold:

1. Mechanical.—A regimen of rest, elevation, and support. The leg should be wrapped securely from the foot to the knee. The foot of the bed should be elevated 15 degrees according to McLachlin's principles. If there is massive edema, the leg itself should be raised to 45 degrees by flexing the hip. Occasionally it is necessary to suspend the leg from an overhead frame. The patient should stay in bed with the foot elevated until the pain subsides or until adequate anticoagulation is achieved. He is then allowed to walk, but he should not sit with legs dependent. There is no merit in applying heat or cold to the extremities.

2. Drug therapy.—Once the diagnosis of thrombophlebitis is made, anticoagulant therapy should be started. Heparin is the drug of choice because of quick initial therapeutic level, prompt clinical response, and safety of control. The recurrence rate of the disease and embolization is three times as great with antiprothrombin drugs as with heparin, and the antiprothrombin drugs are not as effective in protecting the injured endothelium.

Although the dosage of heparin must be varied with the patient's drug sensitivity, his size, and the extent of the disease, the following schedule is a useful guideline to therapy. The initial dose of 100mgm is given intravenously in order to achieve a rapid therapeutic blood level. Thereafter it is administered by deep subcutaneous injections. The dose is adjusted to maintain clotting time between two and three times normal. The usual dose is 50-75mgm, given every six hours. After a steady level of anticoagulation is attained, the clotting time need be measured only once a day.

Antibiotics or chemotherapeutic agents are used only if a septic process is present or if massive edema has been present for a long time. In the latter situation, we use them to prevent cellulitis, since edema fluid is a good medium for bacterial growth. We don't use enzymes, for they may be toxic, they are unpredictable in their effects, and are expensive. Undoubtedly, in the future, some enzymes will be isolated which will activate those within the thrombus itself and will be helpful in the resolution of the process. Phenylbutazone (Butazolidin) and other anti-inflammatory agents are used only in superficial thrombophlebitis. It has not been proved, to our knowledge, that phenylbutazone added to anticoagulant therapy has any greater benefit than anticoagulant therapy alone.

Recently, dextran became another therapeutic agent in the treatment of thrombophlebitis. Bernstein[1] and coworkers have shown that in dogs dextran reduces venous thrombosis produced by chemical irritants. Both 45,000 molecular weight and 75,000 molecular weight Dextran have been used in the treatment of human thrombophlebitis with the best results in the early phlebitis. Cox[7] and his group used it for three days, giving 500cc each day intravenously. They reported good results in nearly 90% of the early cases.

3. Surgery.—Surgery has a limited place in the treatment of acute thrombophlebitis. Lumbar sympathetic block in the early stages might reduce the pain and limit the swelling. Thrombectomy is indicated in massive ileofemoral thrombophlebitis if the patient is seen early in the course of his disease.[9] It will, undoubtedly, reduce morbidity and the ravages of postphlebitic syndrome. Other surgical procedures are warranted only for treatment of complications of the disease.

Treatment of Acute Superficial Thrombophlebitis.—This usually is a self-limiting disease which is best treated by conservative measures. Ice packs to the involved area will relieve the pain. Phenylbutazone will hasten resolution of the inflammation, and elastic support will prevent extension of the process. Occasionally, its course may be protracted. In this case, a proximal ligation and excision of the diseased segment of the vein is indicated.

Complications of Thrombophlebitis

The most dreaded complication of thrombophlebitis is pulmonary embolism, which may appear early or late in the course of the disease. Any patient with pleuritic-like pain, bloody sputum, hypotension, or a lung infiltrate should be suspected of having an embolic episode. Diagnosis is often difficult, especially since the x-ray or ECG findings are not specific. Recently, radio-isotope scanning using albumin tagged with I^{131} and Cr^{51} have shown great promise in the detection of emboli. Pulmonary angiography has also been used as a diagnostic test. The serum enzyme levels are usually not helpful in acute cases.

The treatment of pulmonary embolism should be conservative. It is geared to supporting the

failing cardiopulmonary systems and includes oxygen, vasopressors, digitalis, atropine, and anticoagulants. In institutions where a trained cardiovascular team and a cardiopulmonary bypass are available, pulmonary embolectomy has been successfully performed. This treatment should be reserved for patients who survived the initial massive pulmonary embolization long enough to institute cardiopulmonary bypass and who would not be expected to survive without pulmonary embolectomy. Here, also, treatment should be geared to preventing further embolization. It should include long-term anticoagulant therapy and partial or total interruption of vena cava in recurrent cases.

The second major complication of thrombophlebitis is the postphlebitic syndrome, referred to as the ball-and-chain, which remains as an aftermath of the disease. This is a common and a most incapacitating complication. It is manifested by hyperpigmentation, swelling, secondary varicosities, ulcerations, stasis dermatitis, and recurrent cellulitis. A causalgia-like state of the involved limb may also be present. It is best treated by a conservative regimen. The patient must realize that the disease is never cured, only controlled. This philosophy must prevail until the day that one can replace the vein deprived of its competent valves by disease with venous grafts having competent valves.

The regimen which we recommend consists of rest, elevation, and elastic support. Open ulcers, if not grossly infected, are best treated by Unna Paste Boots. These are changed weekly at first and, as healing progresses, at longer intervals up to one month. Cellulitis should be treated by appropriate antibiotics. Edema should be controlled by mechanical means; in stubborn cases, systemic diuretics may be helpful. Stasis dermatitis often responds to topical steroids. Systemic steroids should be reserved for extensive cases only. Causalgia, though seen infrequently, is a distressing manifestation and requires sympathectomy for cure. Economically, it is unsound to excise and graft all stasis ulcers. Furthermore, there is little evidence that grafts are superior to the epithelium that forms over the ulcer by centripetal regeneration. Ligation and stripping of secondary varicosities and subfascial ligation of the perforating veins will lessen the chances of recurrence of ulceration.

The third major complication is phlegmasia cerulea dolens. Fortunately, it is infrequent. It is caused by extensive thrombosis of the major venous channels of the limb, often extending up to the renal veins and leading to venous insufficiency. Major tissue loss is inevitable unless thrombectomy is performed promptly.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown®
(meprobamate)

Indications: Meprobamate is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, meprobamate fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.

Supplied: 'Miltown' (meprobamate) is available in two strengths: 400 mg. scored tablets and 200 mg. coated tablets. 'Meprotabs' (meprobamate) is available as 400 mg. white, coated, unmarked tablets. *Before prescribing, consult package circular.*

only one in the morning

and one in the evening

Now b.i.d. convenience plus even greater patient savings over q.i.d. tetracycline therapy

(plus all the advantages of tetracycline phosphate complex)

new Tetrex bidCAPS™*

(tetracycline phosphate complex)

laximum patient savings. New idCAPS now enable you to prescribe tetracycline in an even ore economical, more convenient form. Your patient's prescription dollar gets maximum value: a aily bidCAPS dose is priced lower an any other leading brand of tracycline—b.i.d. or q.i.d.

Vell tolerated. Tetrex (tetracycline phosphate complex) is well lerated. Side effects are few nd, to date, no photodynamic actions have been reported.

More of the active antibiotic in the blood. The basic tetracycline in Tetrex (tetracycline phosphate complex) is less bound to serum protein than is demethylchlortetracycline.[1] Result: Tetrex (tetracycline phosphate complex) provides a higher percentage of active antibiotic in the blood.

Available in bottles of 16 and 50.

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms. *Contraindications:* The drug is contraindicated in individuals hypersensitive to tetracycline. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with tetracycline phosphate complex. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Mycotic or bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis and allergic reactions may occur. *Usual Adult Dose:* 500 mg. b.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.

*ch bidCAP contains Tetrex (tetracycline phosphate complex equivalent to 500 mg. tetracycline HCl activity).

Behind continued high blood pressure readings lies the possibility of organic damage[1-13]

MANY OF THE aspects of essential hypertension are unpredictable—either because there are a number of mechanisms involved or because individuals differ in their responses to these mechanisms.[1]

There is one aspect of hypertension, however, that seems, in many cases, predictable. ". . . when the blood pressure is elevated to a marked degree for an adequate period of time, this in itself leads to perpetuation of the syndrome with resulting vascular damage throughout the body."[14] All too often the disease progresses until there is damage to one of three vital organs: the heart, the kidney, the brain.

"Hypertension is certainly a major factor in the genesis of coronary heart disease, and it is even more important when compounded with obesity."[4]

"[Vascular deterioration] can be clearly seen in the kidney with a degree of damage that can be measured by renal function studies."[10]

". . . most evidence suggests that reduction of blood pressure, when it is too high, not only relieves the heart of excess work but reduces vascular damage."[1]

"In short, treatment is indicated."[1]

Antihypertensive therapy will not restore the blood vessels to normal. Yet many of the vascular changes and symptoms caused by increased blood pressure may be arrested or alleviated when the blood pressure is reduced to normotensive levels.[7]

Reducing the blood pressure helps curtail further vascular damage and improves the prognosis — when damage is not too far advanced before therapy is started.[14] Essential hypertension is an indication not only for treatment, but for *early* and adequate treatment of the patient in question.

Reduce the blood pressure with Rautrax-N

Rautrax-N combines the antihypertensive-tranquilizing action of whole root rauwolfia with the antihypertensive-diuretic action of bendroflumethiazide in one convenient medication. The two drugs complement each other so that smaller doses of both are possible.

Rauwolfia combined with bendroflumethiazide is pa ticularly effective in long-term therapy,[15-17] since bene ficial effects do not diminish with continuous dail administration.

For most patients 1 or 2 Rautrax-N tablets daily ar sufficient for maintenance therapy. The simplicity, cor venience and economy of such a dosage schedule ar of particular benefit to older patients.

'The Priceless Ingredient' of every pro is the honor and integrity of its make

ALCOHOL INDUCED HYPOGLYCEMIA

is potentially fatal and can be classified as a medical emergency. Dextrostix determination of blood sugar can expedite diagnosis in the emergency room. • The patient generally responds promptly to intravenous glucose, but prolonged severe hypoglycemia can seriously affect the nutritional status of the central nervous system, causing irreparable damage. • This condition is a consequence of heavy drinking without eating over a long period of time. It can occur in normal, well-nourished people, but clinically it is found as a repetitive phenomenon in "binge" drinkers who do not have overt signs of liver damage but, on testing, show reduced effectiveness of their carbohydrate regulating mechanisms. • The metabolism of high concentrations of alcohol rapidly depletes the liver of its glycogen and impairs glycogenesis and gluconeogenesis, resulting in a profound hypoglycemia.

LEON W. BERUBE, MD

Hypoglycemia as a sequela of alcohol ingestion is a potentially fatal condition which, until recently, has received little attention in medical literature. Since many students as well as practitioners may not be familiar with it, a discussion of this entity appears worthwhile.

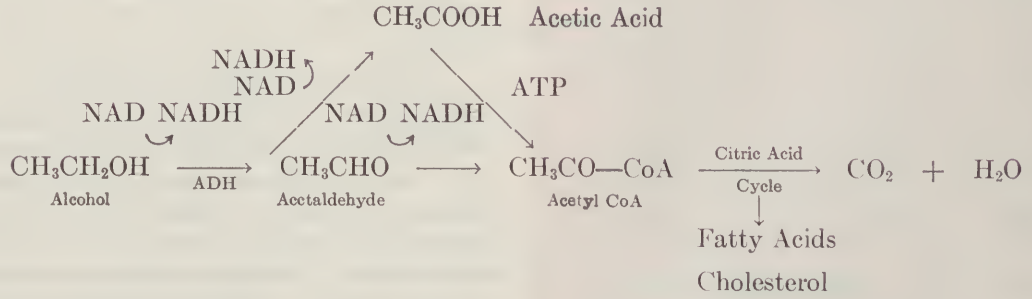
Physicians must consider a diagnosis of alcohol induced hypoglycemia in the unconscious or comatose patient. Typically, the patient is brought to the hospital emergency room in a stuporous or insensible state. Frequently he is having or has had generalized convulsions. The skin is usually cold and may or may not be wet. The pupils may be constricted or dilated; deep tendon reflexes may be brisk or absent. There is no nuchal rigidity between seizures. Blood pressure, pulse, and respiratory findings are inconsistent. Lack of a history or failure to detect the odor of alcohol on the patient's breath may make diagnosis difficult. Grand mal epilepsy, post-epileptic states, acute alcoholism, hepatic coma, insulinoma, hypertensive encephalopathy, strychnine poisoning, cerebral embolus, internal head injury, and intracerebral disease have all been considered as the probable diagnosis after initial examination of the patient.

The blood sugar determination is the key diagnostic aid. Often blood sugar will be lower than 15mg%. Intravenous glucose usually brings immediate gratifying and dramatic results.

Since so many people drink often to excess, why is this condition not commonplace? Why does not each of us see 10 or 15 cases every New Years Day? Why is it that since 1941, when Harvey and Brown described six cases of hypoglycemia after alcohol ingestion, fewer than 100 such cases have been reported?[1] It is safe to say that many cases go unrecognized and that many a DOA is signed out with an inaccurate diagnosis.

To better understand the phenomenon of hypoglycemia, it is helpful to know the manner in which alcohol is metabolized. Although all the steps and possible side reactions of alcohol metabolism are not yet understood, it is generally agreed that alcohol (ethanol) is first oxidized to acetaldehyde. This process takes place mainly in the liver through the action of alcohol dehydrogenase.[2] This enzyme has a molecular weight of 84,000. It contains two atoms of zinc and two molecules of nicotinamide adenine dinucleotide (NAD).* In the oxidation of alcohol to acetaldehyde, NAD is reduced, becoming NADH. The equilibrium point for this reaction would result in metabolism of little alcohol if it were not for

*This substance was formerly known as diphosphopyridine nucleotide (DPN).



the fact that acetaldehyde and NADH do not accumulate.

Acetaldehyde is rapidly metabolized in the liver by acetaldehyde dehydrogenase. Under the usual physiologic conditions it is transformed to Acetyl CoA and possibly to acetic acid, although the latter reaction is questioned by some investigators.[2]

The NADH is reoxidized to NAD through the flavo protein-cytochrome system in the hepatic cells. The NADH in the cytoplasm of the hepatic cell is oxidized by reacting with the cells mitochondria. When large amounts of hydrogen must be handled, other hydrogen acceptors are used. Pyruvate will then be reduced to lactate and acetoacetate reduced to β-hydroxybutyrate.[3] Fatty acid formation from Acetyl CoA also requires hydrogen, which can be supplied by NADH. The reoxidation of NADH is a complex affair and imperfectly understood. It may well be the rate limiting factor in alcohol metabolism.

Acetyl CoA is oxidized via the citric acid cycle to carbon dioxide and water. Acetyl CoA, an important intermediary in alcohol metabolism, is used in the synthesis of fatty acids and cholesterol by the body.

Thus the generally accepted steps in alcohol metabolism might be shown in simplified form as follows:

Disulfiram (Antabuse) has the oxidation of acetaldehyde as its site of action in this metabolic process. Although disulfiram does not completely stop the oxidation of acetaldehyde, higher blood levels of acetaldehyde must be present. The effect of drinking on patients taking this drug is due to these elevated blood acetaldehyde levels.

Hypoglycemia can ensue from inordinate loss of glucose from the body or from inadequate production of glucose. There are many known causes of hypoglycemia: 1) insulin overactivity, 2) excessive tissue utilization, 3) increased metabolism by tumor or bacteria, 4) renal tubular poisons causing glucosuria, 5) starvation, 6) hepatic toxins, 7) hepatic disease, 8) hepatic enzyme defects, or 9) inadequate supplies of glucose precursors.[4] What is the role of alcohol in the production of hypoglycemia?

It was hypothesized that alcohol could stimulate insulin secretion and thereby lower blood sugar. Freinkel and coworkers[1] measured plasma insulin levels and found no increase after ethanol ingestion. In one patient, seen at the time of admission with a blood sugar of 6mg%, they found an increase in plasma insulin after dextrose infusion.

Glucosuria has not been found in patients with alcoholic hypoglycemia.

Increased tissue utilization of glucose has also been considered as a cause of hypoglycemia. Available evidence indicates that there is no increased utilization after ethanol ingestion. Freinkel et al[1] found alcoholic hypoglycemia associated with rising levels of free fatty acids.

Can ethanol induced hypoglycemia then be due to either or both inadequate carbohydrate ingestion and inadequate endogenous glucose production? It is known that prolonged fasting for several days will produce only modest reductions of blood sugar. Clinical experience has also made clear that the alcoholic who eats does not become hypoglycemic. Investigators have starved patients known to have had ethanol induced hypoglycemia for various intervals. Short fasts, 12-24 hours, did not result in hypoglycemia with the amount of alcohol given.[5] Longer fasts, 44-72 hours caused alcoholic hypoglycemia shortly after alcohol ingestion.[1, 5] However, if these patients fasted but were not given alcohol, they would respond with

a prompt rise in blood glucose following 1mg of glucagon,* suggesting that a fast of three days duration did not totally deplete the liver of the glycogen that was readily available for conversion to glucose.

Field and coworkers[5] starved a patient with known alcoholic hypoglycemia for 68 hours, then gave him 40cc of alcohol. His blood sugar dropped in three hours to 35mg%, and 1mg of glucagon had no effect in raising his blood sugar.[5] This would indicate that ethanol induced hypoglycemia follows removal of all available glycogen from the liver cells. This observation concurs with the findings of Neame and Joubert.[6] In 1960 they performed liver biopsies at the time of admission and before treatment on three patients with alcohol induced hypoglycemia. They found no glycogen in the hepatic cells. Ninety minutes after the intravenous administration of dextrose, one patient had small amounts of hepatic glycogen present.

Why does alcohol rapidly deplete hepatic glycogen, especially if there has been antecedent fasting? Although the last word on this mechanism has not yet been written, a study of the literature suggests the following explanation. The oxidation of large quantities of alcohol results in large amounts of reduced NAD or NADH. Ordinarily the NADH is oxidized via the cytochrome chain, but whenever the NADH load is great, other metabolites accept hydrogen. With the body trying to metabolize large quantities of alcohol at a maximum rate by reoxidizing the reduced NADH, liver glycogen must be used. Liver glycogen breaks down to pyruvate, supplying energy to the reaction. The pyruvate, in turn, is reduced to lactate, thereby oxidizing the NADH to NAD and permitting more alcohol to be oxidized to acetaldehyde.

Seligson et al[3] measured lactate, pyruvate, β-hydroxybutyrate, and acetoacetate levels in the hepatic vein of man 90 minutes after alcohol infusion. Their work showed a relative decrease in pyruvate and a corresponding increase in lactate; a relative decrease in acetoacetate and an increase in β-hydroxybutyrate following alcohol infusion. These results are compatible with this concept of glycogen utilization and explain why a non-fasting individual with abundant liver glycogen would not be as affected by alcohol as he would after a fast had reduced his store of glycogen. They are also consistent with the observation that small quantities of alcohol, not sufficient to bring into play alternate routes for the reoxidation of NADH, do not reduce liver glycogen or produce hypoglycemia. They support Tennent's[7] observation that food taken with modest amounts of alcohol after a short fast (17 hours) brought about no significant change in blood sugar levels from the group who fasted then ingested the same 122cc of whiskey. They agree also with the findings of Forbes and Duncan,[8] who starved rats for 16 hours and then gave some of them large quantities of alcohol and glucose. All of the rats were then killed and the amount of liver glycogen determined. The liver glycogen was much higher in the alcohol-glucose fed rats than in those killed solely in the fasting state.

Alcoholic hypoglycemia can be profound. Numerous investigators have reported levels below 20mg%.[1,6,9,10] Freinkel et al reported patients with blood sugars of 5 and 6mg% on admission. In the first case to be discussed, the patient had a blood sugar of 13mg% on one admission. It would seem reasonable to propose that the extremely low blood sugar levels found after ethanol ingestion could result only from almost total lack of glucose production. If alcohol actively promotes the removal of glycogen from the liver, a point will be reached when the original predrinking glycogen is gone. Any additional new-formed glycogen must come from food or endogenous sources via gluconeogenesis then glycogenesis. It has been shown that the type of patient to become hypoglycemic is the "binge" drinker who "ties one on," having had little or no food[1,5,6,9,10,]; it can thus be assumed that any new-formed glycogen must come through gluconeogenesis. Glycogen synthesis may or may not be affected by alcohol. If gluconeogenesis does not proceed at a sufficiently rapid rate, blood sugar and liver glycogen levels will not return to normal for a considerable length of time, even in the absence of continued drinking. If alcohol interferes with gluconeogenesis, then prolonged drinking without food could result in profound

*Glucagon, a pancreatic hormone with an epinephrine-like action, produces rapid hepatic glycogenolysis and elevation in blood sugar. It activates the enzyme phosphorylase which converts glycogen to glucose-1-phosphate.

hypoglycemia even if alcohol has no effect on glycogen synthesis per se.

It is extremely difficult to show in humans whether alcohol interferes with glycogen synthesis. Field and coworkers[5] showed that fructose given during ethanol induced hypoglycemia resulted in higher blood sugar levels than when given without ethanol. Glucagon given one hour later, however, did not cause as great an increase in blood sugar in those patients who had previously had alcohol as it did in those who had none.[5] This study shows that the conversion of fructose to glucose is not affected by alcohol and implies that the synthesis of glycogen is impaired by alcohol.

Since it is not possible from this study to determine the rate of glycogen formation and breakdown, one could wonder whether the higher blood sugar levels in the alcoholic group might be due to increased glycogen synthesis and subsequent breakdown. Field's experimental work on rat and rabbit livers tends to support his conclusions that alcohol does in fact interfere with glycogen synthesis. In one experiment he perfused isolated rat livers with ethanol, then added fructose to the perfusate. An increase in glucose concentration in the media was noted in both the ethanol perfused livers and the controls, but the glycogen content of the ethanol perfused livers was much less than in the controls. The conversion of fructose to glucose was not influenced by ethanol at concentrations of 0.41%, indicating that the inhibitory effect of ethanol in glycogen synthesis occurs after glucose-6-phosphatase is formed. In a second experiment, he found that liver slices from ethanol treated rabbits metabolized less radioactive glucose into glycogen during a 90-minute incubation period than did liver slices from controls.[5]

How does alcohol interfere with gluconeogenesis to produce the extremely low values of blood sugar encountered in alcoholic hypoglycemia? Direct experimental evidence on humans on the site of alcohol inhibition of gluconeogenesis is not available. Field and coworkers[5] perfused isolated rat livers and found amino acid production to be essentially the same in both controls and ethanol perfused livers. Urea production, however, was substantially decreased in the ethanol perfused group, suggesting the point of interference in gluconeogensis occurs in the deamination of the amino acids, and not before their formation.

Only a small percentage of heavy drinkers become hypoglycemic, but most of those that do have a history of repeated episodes. Several explanations have been suggested. Brown and Harvey thought that hypoglycemia was due to a contaminant in the alcoholic mixture their patients drank, not in the alcohol itself, giving rise to the term "smoke poisoning."[11] As more case reports were published, it became apparent that there was no contaminant: ethyl alcohol itself was the hepatotoxic substance. Neame and Joubert,[6] among the first to reach this conclusion, thought that a poor diet over a long period was the essential factor that predisposed one to hypoglycemia after alcohol ingestion. However, there have been cases of hypoglycemia in children who accidentally drank alcohol who had neither been chronic drinkers nor been on an inadequate diet.[12,13]

Chronic liver disease was thought to be necessary to development of hypoglycemia. Neame and Joubert[6] performed liver biopsies on 17 patients who developed alcoholic hypoglycemia and found evidence of cirrhosis in only three. The remaining 14 had normal hepatic architecture. Hed[14] performed biopsies in 12 cases and found some degree of fatty liver in 11, but none had cirrhosis. Other investigators[1,10] also have found no evidence of chronic liver disease in their patients.

The possibility of an underlying defect in carbohydrate metabolism as the necessary factor in alcoholic hypoglycemia has been studied. Freinkel[1] admitted nine patients with this condition during a 21-month period. After the acute episode was over, these patients were subjected to various "loads" to test how they handled exogenous glucose and utilized endogenous glucose. Responses to glucose tolerance tests were equally divided among normal and diabetic type responses. Response to intravenous insulin was at a maximum somewhat later (30 to 60 min.) than in normal patients (20 to 30 min.) and somewhat more pronounced with a blood sugar one-third of pretest value as compared to one-half in normal patients. Maximal response to IV tolbutamide was generally delayed to 60 minutes rather than a normal 30 minutes, even in those patients who had a normal glucose tolerance curve. They concluded that patients developing clinical alcoholic

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

in chewable tablets

in granules for oral suspension

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets
In Granules for Oral Suspension

ERYTHROCIN®-SULFAS
Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

ABBOTT

hypoglycemia did not handle test loads as well as a normal group, even though gross abnormalities in maintaining glucose balance were not found.

The search for the cause or causes of alcoholic hypoglycemia is not over. It has recently been shown that acute sublethal alcohol intoxication produced a substantial increase in urinary excretion of epinephrine and levarterenol in dogs[15] and that an intravenous infusion of alcohol caused reduction of serotonin and norepinephrine in the rabbit's brain stem.[16] The significance of these effects in producing hypoglycemia is a current area of investigation.

CASE REPORTS

Case 1. The patient was a 51-year-old Negro man with a history of alcoholism of at least 15 years duration. He had not been gainfully employed for the past 10 years. He was divorced.

He was 62″ tall and weighed 110 lbs, much shorter and lighter than his brothers. His sisters are tall and thin. They are heavy drinkers, but there is no available history of their having alcoholic hypoglycemic episodes.

Between January, 1964, and April, 1965, the patient was admitted to the local hospital eight times, in various degrees of unconsciousness. He was hospitalized twice in Johns Hopkins Hospital, with one admission of six weeks duration. He was extensively studied at Johns Hopkins. His liver function was normal, and a needle biopsy of his liver showed only mild fatty changes. He had two glucose tolerance tests, one with an essentially normal response, the second with a diabetic type response. He had a prompt hypoglycemic reaction to intravenously administered alcohol, no response to glucagon, but a prompt response to intravenous dextrose. Additional findings were chronic renal disease, inactive pulmonary tuberculosis, and anemia.

Almost all of his admissions occurred between 10 AM and noon, because his cronies would miss seeing him in the neighborhood. As a rule he would have generalized seizures either before or at the time of admission. He usually responded well to intravenous dextrose, becoming alert and symptom-free in two to four hours. On one admission, his blood sugar was 22mg% and blood alcohol level, only 0.05%. This is consistent with the finding that there is no correlation between the blood alcohol and the blood sugar levels.[14] His lowest blood sugar on admission was 13mg%.

Matters took a turn for the worse in December, 1964. On December 16, he was seen in the emergency room with a blood sugar less than 40mg%. He responded well to IV dextrose and was allowed to return home with friends. But he was returned to the hospital at 3 PM, comatose and in convulsions, which continued for 12 hours. His blood sugar on admission was 110mg%; at 4:30, 150mg%; at 9:55, 250mg%. He had neither food nor IV fluids until 10:20 PM. He was mentally depressed on December 17. Not until the next day did he appear alert; he then complained of weakness in his right hand.

His final admission was April 20, 1965. Blood sugar was 49mg%. He responded promptly to IV dextrose, but his mind was not clear. Five hours after admission he suddenly developed generalized seizures, became unconscious, and died 30 minutes later. We were unable to obtain an autopsy.

This case illustrates many of the observations noted by other investigators. In some ways it is a composite of their findings.

This case has its bittersweet side. Throughout Lent, March 3 to April 18, the patient gave up alcohol as a measure of self-denial. He started drinking heavily after attending midnight mass on Easter Sunday. He was found at home, unconscious, on Tuesday, April 20. It might be that his abstinence from alcohol during Lent had permitted his central nervous system to lose its tolerance to alcohol, contributing to the effect of his heavy drinking Easter Sunday and Monday.

Case 2. The patient, a 74-year-old Negro man, was brought to the emergency room at 8 AM on April 18,1965. It was presumed that he had a cerebrovascular accident. He was in a deep coma. An airway was positioned with no response. A Dextrostix blood sugar determination showed a blood sugar of less than 40mg%, found later to be 35mg%. He responded promptly to IV dextrose. The airway was removed by 9:30 AM, and half an hour later, he was talking and moving about. We learned that the patient had not eaten while drinking his Old Crow. He was told in not uncertain terms that that was a "bad bird" for him, and he has not been in trouble since.

These cases are mentioned to make two points and one conjecture. First, alcohol induced hypoglycemia is probably more common than is generally considered. Second, prolonged hypoglycemia can produce serious, irreversible changes in the central nervous system. The CNS depends on blood glucose for its nutrition. Other metabolites in the blood cannot replace the need for glucose, even for relatively short periods.

One must remember that the biochemical and physiologic changes that take place in the body are not isolated occurrences in time and space but go on simultaneously in the various organs and blood stream. Glycogen, a source of readily available high energy glucose is contained in the muscles. This glycogen is not affected by alcohol or fasting, but during convulsions, considerable quantities of it must be used in producing lactate. Since the glycogen-lactate reaction is reversible, one can conjecture that the convulsive seizures seen in alcoholic hypoglycemia are an attempt by the body to convert lactate to glycogen and glucose in order to provide nourishment for the CNS.

Frankly, most antihypertensives are pretty good if you give an adequate dose. I'm looking for one with a simple regimen so that mix-ups in doses and therefore the chance of side effects are minimized.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down

Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Geigy

Thanks to Dexamyl®

brand of dextroamphetamine sulfate and amobarbital

she can say "No thank you" to the crêpes suzette.

'Dexamyl' does more than most anorectics. Because it curbs appetite *and* lifts mood, 'Dexamyl' can encourage the discouraged dieter to stay on her diet.

The mood lift with 'Dexamyl' can make the difference between the success or failure of her diet plan.

Formulas: Each 'Dexamyl' Spansule® Capsule (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming].

Principal cautions and side effects: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Insomnia, excitability and increased motor activity are infrequent and ordinarily mild.

Before prescribing, see SK&F product Prescribing Information.

Smith Kline & French Laboratories SK&F

MEDICAL HYPNOSIS

JACOB H. CONN, MD

Whether treatment by hypnosis is here to stay or whether it will be disparaged, ridiculed, and again disappear from the medical scene will depend upon its use in carefully selected cases by informed practitioners. The history of hypnosis repeatedly has demonstrated that hypnosis has been destroyed not by the excessive criticism of its skeptical opponents but by the extravagant claims of its overly enthusiastic proponents. The members of this Academy and physicians belonging to other practitioner groups are the future hope of medical hypnosis. I have spoken at national meetings to doctors from all parts of the country who have become interested in hypnosis. To them, the practice of hypnosis represents a way of getting closer to their patients and helps them to feel more like doctors practicing an art and less like technicians carrying out routine studies.[11]

The use of hypnosis is a natural consequence of what the doctor is doing in everyday practice.[14] The physician makes direct and indirect suggestions to every patient. When he tells a patient that a laboratory test is non-contributory or that the physical findings are negative, he is in effect suggesting to the patient, "You can stop worrying." When an injection is given, the doctor is suggesting, "You are being cured." Thus, the injection of a saline placebo reportedly has been effective in significantly reducing the systolic pressure over a period of 59 weeks (and the diastolic pressure for 123 weeks) in a series of patients with essential hypertension, while an oral placebo yielded no such response.[19] The writing of a prescription suggests to the patient that his condition can be helped without probing into psychological issues and that he can ignore or forget (repress) the underlying conflicts.[22]

Medical hypnosis organizes these suggestive influences which are based upon the sick person's need for someone to relieve his distress and, therefore, to endow his physician with the power to help and to heal. Hypnosis is not a state of mind but the end result of various psychologic processes. The ideal patient is intelligent and cooperative. The best hypnotist in the world cannot walk up to a stranger in a hotel lobby, announce, "I am going to hypnotize you," and succeed. The patient must be willing and able to concentrate on what is being said and to believe that whatever the doctor says will happen can and does happen. In brief, if the patient will look where you tell him to look and will pay attention only to what you say

Presented before the Maryland Academy of Medicine and Surgery, Baltimore, October 20, 1964.

to him; if he will follow your instructions and let things happen and implicitly believe that you have the power to predict what will occur, then he can be hypnotized effectively.[4-6]

The doctor, in turn, must be convinced of his ability to succeed. He must learn to overcome the feeling of self-consciousness during the phase of induction when he is instructing the patient how to act and what to expect.

Hypnosis has been used to relieve intractable pain in patients with terminal cancer.[2] The relief of pain may last up to several hours or longer, and the patient is taught how to hypnotize himself whenever he requires relief from pain. One comprehensive report concludes that the use of hypnosis substantially reduces the amount of narcotics and helps to keep the terminal cancer patient comfortable and free from anxiety.[3]

I am convinced that excruciating pain—pain that is refractory to narcotics and resistant to all types of analgesic drugs—always includes a major psychologic component. Last year I was asked to see a woman who accidentally had severed the radial and ulnar nerve and most of the tendons of one hand. Her pain was excruciating and did not respond to any type of medication. I hypnotized her, and in about five minutes she reported that her pain was 90% better! Now, a moment's serious reflection is enough to conclude that merely staring and concentrating upon a spot could not have produced this effect unless the patient had an intense conscious need and an unconscious wish to develop this type of interpersonal relationship, which is characterized by selective inattention and passive detachment.

This need on the part of the patient is illustrated by Crasilneck's observation that the sicker the severely burned patient is the better he is as a hypnotic subject. The burned patient not only obtains relief from pain but can be made to exercise the burned limb and can be influenced to eat larger quantities of required foods so that healing occurs more rapidly.[18]

The value of hypnosis in reducing pain and anxiety has been reported in cases of urethral and rectal instrumentation, minor surgery, changing of dressings, and the manipulation of painful joints.[23] In the accident room, hypnosis has been found to be useful when a patient has eaten recently and a general anesthetic cannot be given immediately. Many reports have cited the value of hypnosis in gynecology and obstetrics. The pain of causalgia, phantom limb, and post-herpetic neuralgia has been relieved in selected cases. It cannot be emphasized too often that if the patient is to be helped he must be cooperative and be able to live without his symptoms, which may be of use to him as a neurotic defense and represent a secondary gain. The patient may have become the center of attention, may need to punish himself, or is being supported financially and is receiving the sympathy which he requires and now demands as his right. He may thus be unwilling, hence unable, to surrender his symptoms even under hypnosis.[10, 14, 15]

Chronic skin disorders have been alleviated; warts respond well to hypnotic treatment. In selected cases, persistent hiccups, migraine, thumbsucking, enuresis, nail biting, excessive cigarette smoking, alcoholism, and obesity[24] can be treated effectively. Frigidity, dyspareunia, premature ejaculation, and impotence usually are associated with severe personality disturbances and therefore require psychotherapy as well as hypnotherapy.[20] I have reported the beneficial effects of the hypnotic treatment of war neuroses, sex offenders, and severe hysterical depressions.[6-8, 12]

The treatment of stuttering is not as easy or as successful as some reports would suggest. The lifelong stutterer has developed severe neurotic defenses and is resistant to hypnotic treatment. The onset of stammering in adolescence is usually an hysterical disorder which is amenable to hypnotherapy. There are the amnesias of acute onset and fugue states for which hypnosis is a specific form of treatment.

The recall, under hypnosis, of a single traumatic event or series of traumatic experiences (which often are spurious) is not invariably associated with cure. Therefore, it is wrong in principle and misleading in practice to inform the patient directly or indirectly that he will recover as soon as he can recall certain "buried" memories. What usually happens is that the patient feels compelled to fabricate traumatic events in order to please the hypnotist. Hull has shown that patients fabricate more readily under hypnosis than in the waking state.[20] Each hypnotist obtains those psychological contents, which he indicated to his patient as being the ones that interest him.

The practitioner must remember that the value

of emotional release (abreaction) lies not in itself but in the fact that the patient is ready (set), able (mature enough), and willing (unconsciously wishes) to get well and to stay well (that is, he can maintain realistic goals). Only then can the patient endow the therapist of his choice (the transference object) with the power to cure him.

Hypnosis, like penicillin, should be used discriminately and always with the full consent of the patient.

The general practitioner should always begin by using waking suggestion. Certain patients are more suggestible when fully awake. The doctor who tells a patient: "You are beginning to look better. You are one of my best patients, and I expect you to improve even more during the next two weeks," is bringing new life to his patient. A recent study of glaucomatous patients[1] demonstrated that intraocular tension was reduced more effectively when the doctor directly told the patient, in a sincere manner, that the headaches would disappear and that the eye condition had improved than when suggestions were given while the patient was under hypnosis or posthypnotically.

Some patients are most suggestible when asleep; others respond best to suggestions in the light stage of hypnosis. A patient may develop a somnambulistic state and still may not respond to suggestion if he is not properly motivated. Dr. Wolberg tells of a doctor who asked to be hypnotized to prepare himself better for the New York State Board examination. He was an excellent subject and all went well. On the day of the examination he called Dr. Wolberg and sheepishly confessed that he had not taken the examinations because he had overslept. His father had insisted that the patient take the examinations in New York, but the young man had a sweetheart in another state and preferred to take his boards in that state. He had solved the problem by oversleeping, after having consented to take them in New York to please his father.

Many patients are passive and remain silent as soon as they develop the specific interpersonal relationship which is the trance state. These individuals should be told, "Enjoy being relaxed. You have nothing on your mind. That is good. Don't say anything until it comes to you naturally and without effort. What you say is not as important as how you act in keeping with your natural, real feelings. You can say nothing and get well, if that is what you want to do." In this manner the patient is free to find his own way of expressing himself while in the trance state.[10]

One of the recurrent problems is the patient who insists that he has not been asleep; hence he has not been hypnotized. Hypnosis is not sleep, it is "imitation" sleep. I tell my patient that hypnosis is not sleep and that if he wants to sleep to do it at home. "You came here," I say, "not to sleep but to learn how to relax and how to live more effectively, fully, and without your present neurotic complaints." The patient in the hypnotic trance is not passive; he is an active agent who uses the doctor as the means of restoring the patient's feeling of mastery and control.[9]

The patient will not do anything contrary to his moral code if it is directly suggested; but if his perceptions and conceptions are altered, he may steal or attack any person who is pointed out as being a danger to himself or to his loved ones.[11]

The patient awakens when he is told to do so with very few exceptions. It takes much more skill to induce the trance state than to arouse the patient, who, if left alone, will "sleep it off." Failure to awaken (dehypnotize) usually occurs either because the patient is hostile to the hypnotist and wants to remain longer in the trance so as to "even things up" or because he enjoys being in the relaxed trance state and does not care, for the time being, to return to his troubled life situation. The effective handling of such resistance and hostility should be part of the training of any hypnotherapist.[12]

Neither amnesia nor the "deep state of hypnosis" is necessary for therapeutic success, since in many cases "cures" can be achieved with suggestion in the light stages of hypnosis. It is not necessary for the patient to talk while in the trance state. Excellent results can be obtained without probing for psychological contents. The hypnotist only sets the stage; it is the patient who induces the trance by doing what is expected of him.

In 1941, a young married woman whom I had interviewed several times asked: "Why don't you do something else besides talking to me? Why don't you hypnotize me?" I was willing to do so, but as I had never hypnotized anyone previously, I hesitated until the patient added the additional stimulus which I needed by saying, "I know that you can hypnotize me because my husband can do

it, and he is not even a doctor." As my professional self-esteem was at stake, I held up my hand with an assumed self-assurance, and before I had a chance to speak, the patient entered into the trance state; she had hypnotized herself.[15] This experience taught me humility. All I had done was to set the stage; it was the patient who had satisfied a particular psychological need by establishing a specific type of interpersonal relatedness which was characterized by passive compliance and selective attention. Thus, at the very beginning of my interest in hypnosis, I learned that anyone, even someone who was ignorant of the theoretical and technical implications of hypnosis, can hypnotize a patient.

Even when the patient is skeptical and says that he has no faith in hypnosis, it is how he behaves rather than what he says which indicates the degree of his unconscious need for a regressive, compliant relationship.

The psychodynamics involved in the hypnotic relationship can be summarized as a need to dominate or to be dominated, a conviction on the part of the subject that he will fail in the task of hypnosis, a fear of losing his will power, a need for dependency, expiation, or the feeling of guilt and a terror of intimate interpersonal relations. To some patients, hypnosis may mean death, a homosexual or heterosexual relationship, or a rebirth fantasy.[9]

The hypnotist also must know himself. He must not derive too much vicarious satisfaction or power from the treatment of the patient in the trance state. He must be aware of the dangers of becoming involved in the patient's paranoid projections, of arousing repressed conflicts which may overwhelm the patient, of becoming the object of the patient's sexual fantasies, or of removing symptoms in disturbed, unstable individuals who require their symptoms as defensive maneuvers.

The dangers of hypnosis are those which accompany every psychotherapeutic relationship. Anyone who hypnotizes a prepsychotic patient without knowing what he is getting into is like the fool who ventures where angels fear to tread. *Psychiatric training is an absolute prerequisite for diagnosis as well as for intensive hypnotherapy.*[13] The average practitioner should confine his hypnotic efforts to the preparation of the patient for surgical procedures, and the alleviation of pain (analgesia and anesthesia) and postoperative comfort.

Every medical procedure includes the same fundamental ingredient: the personal worth of the doctor. Hypnosis is nothing more than suggestive influence of the doctor upon whom the patient depends for both care and emotional support, presented in a specific interpersonal setting. It is not a panacea for all the ills of mankind. If it is used discriminately for those who can endure living without their neurotic defenses, then in these *carefully selected* cases hypnosis can help to remove the functional overlay of organic disease, to relieve pain, to alleviate anxiety, and to facilitate the recall of significant traumatic events.

Diagnosis:

cystitis?
pyelonephritis?
pyelitis?
urethritis?
prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.d.
(initial adult dose)

cations: Urinary tract infections caused by gram-negative and some gram-
itive organisms.

effects: Mainly mild, transient gastrointestinal disturbances; in
asional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild
nophilia, reversible subjective visual disturbances (overbrightness of
s, change in visual color perception, difficulty in focusing, decrease in
al acuity and double vision), and reversible photosensitivity reactions.
ked overdosage, coupled with certain predisposing factors, has produced
convulsions in a few patients.

autions: As with all new drugs, blood and liver function tests are advis-
during prolonged treatment. **Pending further experience, like most
notherapeutic agents, this drug should not be given in the first trimester
egnancy. It must be used cautiously in patients with liver disease or
re impairment of kidney function.** Because photosensitivity reactions have
rred in a small number of cases, patients should be cautioned to avoid
cessary exposure to direct sunlight while receiving NegGram, and if a
tion occurs, therapy should be discontinued. The dosage recommended
dults and children should not arbitrarily be doubled unless under the
ul supervision of a physician. Bacterial resistance may develop.

h testing the urine for glucose in patients receiving NegGram, Clinistix®
ent Strips or Tes-Tape® should be used since other reagents give a
-positive reaction.

**ge: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times
for one to two weeks. Thereafter, if prolonged treatment is indicated,
osage may be reduced to two Gm. daily. Children may be given
ximately *25 mg. per pound* of body weight per day, administered in
d doses. The dosage recommended above for adults and children
d not arbitrarily be doubled unless under the careful supervision of a
cian. Until further experience is gained, infants under 1 month
d not be treated with the drug.**

supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conve-
y available in bottles of 56 (sufficient for one full week of therapy) and in
s of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

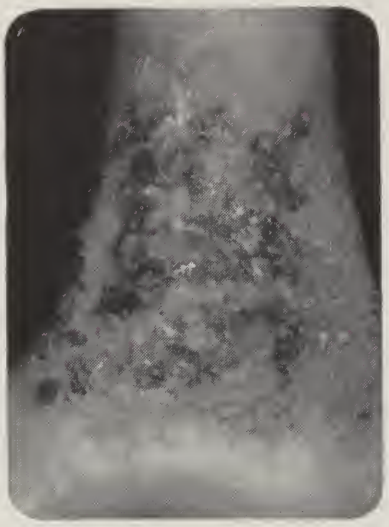
Winthrop Laboratories, New York, N. Y. 10016

NegGram®

Brand of

nalidixic acid

a specific anti-gram-negative



eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.

- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

Eczema of many years... controlled in two weeks

Before treatment

After treatment –
with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

THE BONUS YEARS

Suggestions for mature people approaching retirement

W. GRAFTON HERSPERGER, MD

It is important for men to plan for their retirement or bonus years—more people are living longer. At the beginning of the Christian era, the average life span was only a little more than 22 years. Records in England and Wales during the 1850-1860 decade show that the average length of life in those countries was approximately 40 years. In 1900, the average American could expect to live 47 years. In 1960, in the United States, the average life expectancy for men was 69 years and for women 73 years. An article in January, 1965, indicated that the age for women has advanced to 75 years. During the past several decades, the life expectancy for women has been lengthened because of a significant reduction in deaths associated with childbirth.

The exact reason why women live longer than men is not entirely clear. Some have suggested that nature places a higher value on the female of the species; others have suggested that women have a more rugged and durable constitution. We know that the high level of the female hormone is significant in reducing the incidence of coronary artery heart disease during the childbearing period. There are exceptions, however, as evidenced by the occurrence recently, in Baltimore, of coronary thrombosis in a woman 22 years of age. It is generally believed that women do not experience as much stress and that, for the most part, they do not work as hard or as intensively as men. In the past it was thought that women worried more than men, but recent observations indicate that husbands are worrying equally as much as their wives.

At the present rate of increase, it appears that the average life span will have reached 80 years in 1980. The life expectancy increases with advance in age; when one has attained the age of 65 years, there is every reason to believe that he will live to be almost 80 years of age. At age 85, an average of 90 years may be anticipated.

In many undeveloped areas of the world where modern methods of sanitation, health facilities, and disease control are essentially unknown, the average life span is not much greater than it was during the early Christian era. When the limited life expectancy in such areas is compared with the present figures for longer life in North America, it is interpreted as evidence of the part science is playing, and will continue to play, in prolonging life.[1]

How long then can a person live with the best possible heredity, the most healthful living conditions, the ultimate in medical attention, and, in addition, good luck? In the fifth chapter of Genesis, one reads that Methuselah lived 969 years and that Lamech lived 777 years; and in the ninth chapter of Genesis, we find that Noah is said to have lived 950 years. Most interpreters explain the high figures given for these ages as a manifestation of the enthusiasm of the chronicler for his ancestors and believe that the writing is basically symbolic. Methuselah was 187 years old when his son, Lamech, was born; Lamech

---

This paper is based on talks given to retiring letter carriers of Baltimore City and Anne Arundel County, to the Board of Lady Managers of Keswick, and to the Civitan Club of Baltimore and the Torch Club of Baltimore. A condensed version appeared in *The Torch*, October, 1965.

was 182 years old when his son, Noah, was born. Noah was 600 at the time of the flood. If one adds 187, 182, and 600, the total is 969 years, which is the age at which Methuselah died. One well might ask, "Did Methuselah drown at the time of the flood and die prematurely?"

The Ninetieth Psalm tells us that we may expect to live three score years and ten and, by reason of strength, four score years. The average life expectancy in the United States has passed the three score years and ten mark and is now on the way to four score years, which will probably be attained in approximately 1980. The sixth chapter of Genesis states, "Man's days shall be an hundred and twenty years," this concept having been obtained from the Egyptians by the Jewish people. It is not at all unusual, when one orthodox Jew takes leave from another, to hear him say, "I will see you in Jerusalem and may you live to be an hundred and twenty years." A doctor here in Baltimore who has many orthodox Jews as patients reports that when they leave his office they will frequently say to him, "May you live to be an hundred and twenty years."

An Eighteenth Century French anatomist, Georges Buffon, observed that the average duration of life of an animal was approximately five or six times the period required for the maturing of his bones.[1] He observed that the average dog's bones matured in two to three years and that the dog lived to an average of between 12 and 18 years. One of my anatomy professors reports that chimpanzee bones mature in five to six years and that, in captivity, it is not at all unusual for a chimpanzee to live to be 30 to 35 years in age. Man's skeleton matures in about 25 years. If we multiply 25 by 5 or 6, the product is 125 to 150 years. To be scientifically honest, however, I must say that my former anatomy professor reports that in some rodents a few of their bones do not mature until the animal has reached old age. These facts, then, with respect to the Buffon formula are reported simply as a matter of interest and speculation.

How close has anyone ever come to attaining such an age? There have been reports from time to time of a person's having lived to a fabulous age; but these reports have not been adequately documented. The oldest Civil War veteran lived to be 117 years old, and more than 40 others lived more than 100 years. There are now several thousand centenarians in the United States. The University of Kharkov, in Russia, has several thousand centenarians under observation and study, and numerous other centers on the Continent are making similar observations.[1]

Recurring reports during the past score or more years have described the Hunzas as people of extraordinary good health and exceptional longevity. It is said not to be unusual for the men to attain ages of 120 to 140 years. Hunza is an isolated country about the size of New Jersey, situated high in the Himalaya Mountains, just north of the Pakistan border and approximately 15 miles from Russia. From 1948 to 1951, a vertebrate paleontologist, now on the staff of the Chicago Natural History Museum, lived among and worked with the Hunzas. In addition to showing them how they could make the best use of their natural resources, he established a medical dispensary, to which the people made 5,680 visits for treatment during the three-year period. There were few with diseases common to civilization. Nutritional disorders, such as scurvy and rickets, were common, as were marked dental caries, skin infections, and epidemics of severe dysentery. Many of the Hunzas had malaria and intestinal worms, and 5% of the population had trachoma. Direct questioning of the teenage boys revealed that in many instances one or two members of their families had died relatively young and that there were no written records to document ages of the Hunzas. The author's prolonged period of living among the Hunzas led him to contradict the impressions reported by other travelers based, he believes, on too brief a period of observation. The Hunzas do develop certain types of disease, and the author concluded their average life expectancy is not significantly greater than that in other parts of Asia.[2]

The answer, then, as to how long a person can live cannot be given at the present time. However, the conquering of one disease after another and the attacking of the congenital disorders and the deteriorations have led some students to predict that within the next 50 years, the average life expectancy of persons having the benefits of scientific investigation and treatment will exceed 100 years. It would appear that the most difficult hurdle to be taken is that of finding a way to properly balance the human body chemistry and prevent the deposition of "rust in the pipes"—

atheromatous plaques—elevated areas in the lining of arteries that appear to begin as deposits of fat molecules and cholesterol.

Gerontology, a word derived from the Greek words for old man and treatise, is the science or the study of aging. It includes: 1) aging of the individual as a unit, 2) biologic changes affecting the different tissues, 3) sociologic aspects of aging. The discussion which follows will concern itself primarily with the first and, to a lesser extent, with the third.

Geriatrics, derived from the Greek words for old age and "relating to the physician," is that department of medicine concerned with problems peculiar to old age and aging. Geriatrics is not a specialty in the usual sense of the word because the services of many different types of physicians are required. The general health and illnesses of older people require services of the general practitioner, the internist, the orthopedist, the dermatologist, the general surgeon, and so on. It is preferable to speak not of geriatrics but of geriatric medicine. Geriatric medicine is concerned not only with the sick but also with those who are well; not only with persons 65 years and more but especially with those in the 40-60 age group. It is frequently possible during this period to detect physical, psychological, and emotional deviations from the normal and take steps to correct, or at least modify, these deviations before they have reached an advanced stage and thus help people have better health when they reach the mature and older years.

Persons in this middle age group are encouraged to develop intellectually, sometimes spiritually, to maintain social contacts, to participate in some community effort, and to try to develop hobbies. It is best that the hobby be an active type hobby, one in which the individual takes the leading role and in which he creates something, such that an end product is the result. Several months ago, a letter carrier was asked if he had made any plans for retirement. He promptly reported that he had; that during recent years he had been doing the painting and wallpapering in his own home and for several others in his neighborhood. He was confident that upon retirement from the postal department, he would find plenty of work not only to keep him busy but also to provide an income to supplement the pension he would receive. Another man, who is already retired, has had carpentry and woodwork as his hobby through the years. When he observed that there were many boys in his neighborhood who seemed to have nothing to do, he used a portion of his basement to set up a school in carpentry and cabinetmaking and provided the tools so that boys could come and learn a new skill and spend at least a portion of the time off of the streets of the community. This man has realized much happiness and satisfaction from this work, being confident that he has done much to reduce the juvenile delinquency in the area where he lives.

At the Keswick (Home for Incurables), in the Occupational Therapy and Arts and Crafts Departments, the concept of creating something so that one will have an end product is emphasized among the patients. The patients paint pictures and trays, weave, sew, knit, work in ceramics and woodwork and leatherwork, and have entered many of their products in a local county fair. The ribbons that they win and the objects that they create are a great source of happiness to them and do much to help them psychologically, in addition to helping to keep their minds and their hands active. On one of my visits an older woman, who was sitting in a wheelchair, said to me, "Doctor, look at this little doll that I have made. These old legs of mine are no good, but my hands are all right, and this little doll is going to make some child happy at Christmastime."

It is better not to confine oneself to passive hobbies such as reading, watching television, playing bridge, or going to the theater. It helps much to see something accomplished and to have an end product. Many people obtain this same satisfaction by visiting the members of their church who are ill, or homes for the handicapped, the blind, the mentally disturbed

Sixty-five is not old. Men are not necessarily "as old as their arteries," as you have heard stated from time to time. Men in their 20's and 30's frequently have tortuous, thickened temporal arteries, and many laymen have thought that this represents serious arterial disease. In reality, the changes do constitute an aging process of the artery, but it is the middle coat of the artery that has undergone degeneration and loss of muscle and elastic tissue. The canal in these arteries does not become obstructed, and such arteries almost never rupture. Contrast this process with the development of the atheromatous plaques, in

arteries such as the coronary arteries of the heart. This is a serious degenerative change in the artery because it is the inner layer of the artery that is affected and its location in the coronary artery is a life-threatening process which may very well lead to coronary thrombosis. The important consideration, then, is not just simply the aging process in the artery but the nature of that aging process and the particular artery in which it takes place. Men are as old as their skin, scalp, cerebral cortex, arteries, bones, and all their other tissues. The calendar is not necessarily a good yardstick, much depends on the individual's attitude and his spirit. The most important item is the way one selects his parents.

Aging includes all of the acquired changes through the years plus the involutional changes common to man. Involutional changes include graying of the hair, loss of hair, loss of teeth, thinning and loss of elasticity of the skin, farsightedness (presbyopia), loss of muscle mass and agility, fragility of the bones, arteriosclerosis, certain types of arthritis, and enlargement of the prostate.

At this point, attention is called to an article in a recent issue of one of the popular magazines. The author of this article indicated that a one-minute rectal examination every six months will enable the doctor to find hard areas in the prostate, indicative that a cancer has developed.[3] This cancer can be removed if the abnormal tissue has not extended beyond the prostate. In the event the latter has occurred, the female hormone can be given in moderately large doses and, in addition, the male gonads removed. The removal of the male gonads eliminates the organ that produces the major portion of the male hormone which tends to promote the further growth of prostatic cancer and the administration of the female hormone tends to cause dissolution of the prostatic cancer wherever it happens to be located. As a result, the life of the individual may be prolonged many years.

The ability to learn continues into advanced years, providing the person has had the capacity to learn during his younger years. The reason that older people do not do well in intelligence tests is thought to be a result of diminished speed rather than of diminished knowledge. Judgment tends to increase with the years if the individual has had good judgment when he was younger. It is surprising how often intelligent men come to the doctor's office greatly upset because of a reduction in the sex urge. This is something that comes to everyone sooner or later and should be accepted with tranquility and one's interests directed into other channels.

The acquired changes include significant injuries, infections involving the lungs, kidneys, and bladder, and the effects of stress and tension. The incidence of cancer of the lung is much greater in persons who smoke, especially those who smoke excessively; and cirrhosis of the liver may develop in those who drink alcohol excessively and do not have a good general diet. At any one time, a person's health may be said to represent the sum of these involutional and acquired changes.

It is impossible to discuss all of the complaints people in their mature and older years present to the doctor. Pain in the chest is a symptom that nearly everyone experiences at one time or another, and we will speak briefly about this. Most people who have pain in the left side of the chest do not have heart disease, although many think they do. Often a member of the family may have had a heart attack, or they know some other person who has. Furthermore, heart disease is being given a lot of publicity in the various news media. There is, too, the fact that the heart is the organ of sudden death. The heart has always been a focus of interest, giving rise to familiar expressions such as warm-hearted, heavy-hearted, heartfelt, faint-hearted, chicken-hearted, loving with all my heart, hard-hearted, heartless, and heart fluttering or trembling. Little wonder that discomfort in the chest gives rise to anxiety. If a person has discomfort in the chest that he suspects might be related to the heart, he should consult his doctor and allow the doctor to make whatever examinations are indicated. If no evidence of heart disease is found, he should have confidence in the information given by the doctor but should report the occurrence of any new symptoms.

If some disorder of the heart is found, the physician should take time to explain to the patient the extent of the abnormality and try to allay his anxiety, thereby helping to reduce the likelihood of early recurrence. The physician should outline a program of management, which includes an effort to reduce stress in whatever way possible. This relates to problems at the individual's place of employment as well as in his home. The total

calorie intake should be such as to maintain the person's weight at normal or slightly below normal for his height and age. This ordinarily requires reduction of both starchy foods and fat.

The relative importance of reducing fat in the diet, especially saturated fat, is not completely settled. Studies are being carried on in various centers in the country, and the answer may be forthcoming within the next few years. For the present, it seems desirable to limit to some extent the foods that are high in saturated fatty acids. A well known cardiologist says, "In our society, the worst form of malnutrition is over-nutrition."

Salt intake should be restricted.

Recent observations appear to indicate that persons who smoke cigarettes, especially those who smoke more than 20 cigarettes a day, have an incidence of coronary thrombosis between two and three times as high as those persons who do not smoke cigarettes. There is reason to believe that if a person discontinues smoking cigarettes, the likelihood of his suffering coronary thrombosis will be essentially the same as if he had never smoked.

Regular exercise within the capabilities of the person is important, approximately one-half hour each day being set aside for this. The amount of exercise taken should be less than that which gives rise to any heart symptoms or to undue fatigue.

All normal people want to live long, but longevity is not the primary object. The quality of the life during the mature and older years is much more important. The additional years should be characterized by the best possible health and economic security, self-reliance, self-sufficiency, maintenance of social contacts, participation in some community activity, and continuance of intellectual pursuits as long as one is able. The best possible health can be maintained by selecting a physician, if one has not already done so, and by allowing him to take a complete history and make a thorough physical examination and do whatever x-rays and other tests that are indicated. Every aspect of one's health—physical and psychological—should be discussed with the physician, and periodic examinations should be made, perhaps once a year. If new symptoms develop in the course of the year, these should be reported promptly to the physician.

Self-sufficiency, economic security, and the making of a contribution to the community could, in most instances, best be accomplished if the person is able to continue his regular occupation. However, the trend seems to be toward setting a younger rather than an older age of retirement, possibly moving toward age 60. A recent study[4] projecting labor availability to the 1970-1975 period and, at the same time, estimating the economy's needs at that time, indicates that the supply will be significantly greater than the demand, and there is every reason to believe that the older worker will be the one primarily affected. The concept of "flexible retirement," whereby a person may retire several years in advance of his compulsory retirement age, has been suggested as a means of reducing the total labor force and making available positions for younger workers as well as for some of the older ones who might wish to work longer than their specified retirement age. It is not generally believed that this will do much in the way of providing work for the older person.

One of my friends retired from the Baltimore Gas and Electric Company two years ago, when he was 55, and has been helping his wife in a post office in Baltimore County. He is also an organist and is frequently asked to play in churches and elsewhere. When he was asked whether he had been as happy during these past two years as when he was working regularly, he said that he was happier and more content, that he was so busy that he could not find time to do many things that he wanted to do. Contrast this with the results of a survey several years ago of a large number of men who were approaching compulsory retirement at age 65 years. Only 10% of those questioned desired to retire. Apparently, for financial and psychological reasons, the majority wished to continue their usual way of life. However, recently, among my patients who have been approaching retirement, at least half report that they are looking forward to it, apparently having made plans for the things they wish to do and believing that they will be able to make the financial adjustments that will be necessary. This is not to say, of course, that many people whose interests have centered solely about their work do not tend to deteriorate more rapidly once they have left it.

It does seem unfortunate that business and industry should not continue to make use of the wisdom and knowledge and experience as well as

the skills of the older workers. Once retired, their opportunities for useful and rewarding employment are limited. It is the loss of society as well as of the individual. I have a patient who is a chemist, age 63, now employed in industry, who has done some teaching in high school and junior college during his career. Two years hence, at the time of his retirement from industry, he hopes to teach chemistry in high school or junior college. Many of the smaller colleges are employing capable teachers who have been retired from the larger universities and find that both their faculties and their students benefit.

Some students of the problem point to the possibilities for employment of older persons in service-type occupations and the need for more effort in the field of social improvement. There are those who suggest that greater employment of older people would increase their buying power, which would increase the gross national product; this, in turn, would provide more employment opportunities. Such an increase in the gross national product could occur only if employment of these older persons constituted a net addition to the total work force. Only time and the economists can supply the answer.

Whenever I have talked with groups of people approaching the retirement age, I have encouraged them to try to find a different type of work to do, full-time or part-time, with pay or voluntary. Most people find such new work serves as a stimulus and a challenge and that it can bring them many years of happiness and satisfaction. The son of one of my patients retired from a position as vice-president of a bank two years ago. During the past 21 months, he has been the director of the Over Sixty Employment Counseling Service. He reports that during this period, 1,100 people over 60 years of age have registered for employment and that more than 400 have been provided positions, either full-time or part-time. The leaders of the larger businesses and industries in the Baltimore area have manifested great interest in this project and have made generous financial contributions toward supporting it, but they have not employed these older people because of the existing policies of compulsory retirement and the pension plans that all of them have. The director of this Employment Counseling Service reports much happiness and contentment in this new work. He is convinced that it is helping him just as much as it is helping those for whom he is able to obtain work.

As one tries to maintain the best possible physical, mental, and emotional health and the greatest degree of security possible, he should cultivate the spiritual, too. As we increase in years, we tend to spend more time contemplating the hereafter, examining our convictions and endeavoring to strengthen our religious faiths. I have observed that many of my older patients read the Bible regularly. I find them reading it early in the morning, before turning to the daily paper with all of the disturbing headlines on both the front and the back pages. It seems to give them a better start for the day. I have also observed that the happiest, most contented older people are those who have succeeded in developing a satisfying religious faith.

Finally, I would say that the person who keeps body and mind active and interested and curious for knowledge, who avoids becoming self-centered, but takes an interest in social and community activity, who finds some type of new work to do, who does not neglect the spiritual, and who makes up his mind to be optimistic, and avoids being irritable with his family and friends has the best chance of enjoying the bonus years. Physical changes do occur in all of us, but sooner or later we discover that with modification of pace and cultivation of a cheerful and healthful state of mind, the reduction in physical vigor can be sufficiently compensated for by a mature philosophy, the product of the experiences and accumulated knowledge and, hopefully, wisdom, as the years come and go. The retirement or bonus years constitute another stage of life and can be happy years toward which many people look forward.

Robert Browning wrote in "Rabbi Ben Ezra":

> Grow old along with me!
> The best is yet to be,
> The last of life, for which the first was made
> Our times are in his hand
> Who saith, "A whole I planned,
> Youth shows but half; trust God: see all, nor be afraid!"

this issue: emergency anesthesia and the common cold

When emergency anesthesia is complicated by the common cold

Barry Belonsky, M.D., F.A.C.A.
Staff Anesthesiologist, Hospital of The Albert Einstein College of Medicine, New York City

Medical facilities are often presented with unfamiliar patients who have unknown health histories. This is particularly true in emergency situations that arise due to accidents or acute illnesses. These cases may need prompt care requiring anesthesia, and if they involve colds, nasal allergies or other upper respiratory infections, can account for many complications which make up a major hazard during emergency anesthesia.

Administration of general anesthesia to a patient with a cold or upper respiratory infection is a hazardous undertaking. It should be avoided if at all possible. Indeed, the presence of U.R.I. is good reason for postponement of elective surgery.[1] In emergency surgery, regional or local block should be considered, but if general anesthesia is mandatory, it should be approached with utmost caution.

Since the attitude of "emergency surgery — hurry" has been replaced by "emergency surgery — watch out",[2] a knowledge of the complications is a great help in preventing them. Here is a brief outline of the problems involved and their treatment. Prevention of the complications is discussed later.

Complications during the induction of anesthesia

Most of the complications are a direct result of secretions and some a result of accompanying secondary infection. For example, *airway obstruction* due to excessive secretions occurs very commonly and is the direct effect of the cold. Respiratory exchange may be obstructed at any time during anesthesia because of excessive secretions, but is most likely to occur during induction. Suction apparatus must be available to overcome this.[3]

Excess secretions which stimulate and irritate the epiglottis and vocal chords can cause *laryngeal stridor and obstruction*. This can lead to complete laryngeal closure with resultant anoxia and death.

Bronchospasm and laryngospasm can result fro secretions penetrating the bronchi and bronchiol In laryngospasm, there are both inspiratory and e piratory stridor and difficulty in inflating the ches in bronchospasm there is an expiratory wheeze, b not as much difficulty in inflation, although som resistance may be felt. Stridor is due to partial complete closure of the vocal cords in spasm and t "crowing" sound is almost pathognomonic.

Secretions obstruct the nasal airways. This produc *difficulty in ventilation* through the mouth until t patient is deep enough to place an oral airway. A intravenous agent can be given to facilitate the duction of anesthesia.

Difficulties can arise if intubation is performed ventilate the patient. For example, teeth can broken by too vigorous attempts at intubation, the intubation itself may be technically difficult d to secretions obstructing the view of the glottis. T postoperative sequelae of intubation ranges fro mild laryngitis to pneumonia with atelectasis, a are seen far more commonly in patients sufferi from colds than in normal patients.

Successive stages of laryngospasm which produce the c acteristic stridor or "crowing" sound.

Progression of bronchioles into bronchospasm.

Complications during the maintenance of anesthesia *Bronchospasm* can occur in an unintubated patient due to secretions entering the bronchial tree from above, and acting as an irritant to the bronchi and bronchioles. Secretions accumulate quickly and the patient has to be suctioned continually. The whole cycle of coughing, bucking, laryngospasm and bronchospasm may ensue. The difficult decision here is whether it is better to suction the patient continually or to use an endotracheal tube which protects the cords and bronchi but introduces the risk of attendant complications.

Postoperative complications Postoperatively, complications can be more serious than even the intra-anesthesia complications, and occur much more frequently in a patient who has been intubated.[4]

Sore throat and pharyngitis can result both from the preoperative upper respiratory infection and from the drying of the mucous membranes which occurs during anesthesia.

Tracheitis and bronchitis often result from secretions trickling down the tracheobronchial tree.

Laryngitis is frequently seen in patients with upper respiratory infections who have been intubated. There is a significant increase in the incidence of laryngitis compared to that in patients without upper respiratory infections.

Subglottic edema is a condition which occurs mainly in children who have been intubated. This pathology results from an exudate developing in the areolar tissue just below the cords. Because of the small size of the child's trachea, even a 1 mm increase in size of the mucous membrane can severely impair the air passage. Children exhibit this by severe expiratory stridor and may even become cyanotic. This may so severely embarrass the child's breathing that it must be treated vigorously. Most authorities agree on the treatment[5,6,7,8] consisting of a high oxygen concentration in the inspired air (60%), plus high humidity (close to 100%). Adequate parenteral fluid intake and slight cooling of the body temperature (by a cooled oxygen tent) also help in mild cases. In severe cases, there may be hypoxia which increases the restlessness and the oxygen demand rises. Sedation is often necessary, although concomitant depression of the respiratory center is undesirable. An antihistaminic accomplishes this purpose well, and adds sedation. Since there is always a possibility that an allergic response plays a role in edema, some relief of the respiratory distress may occur. Steroids should be used to control inflammatory and allergic phenomena and swelling. If all this fails, and the patient is still restless and hypoxic, a tracheostomy should be performed immediately.

(concluded on following page)

Your patient can breathe easily, flying from New York to Rome, on just one Triaminic timed-release tablet.

One tablet goes a long way. For 24 hour relief of nasal congestion and postnasal drip due to sinusitis, colds and respiratory allergies—simply prescribe one Triaminic timed-release tablet, swallowed whole, in morning, mid-afternoon and at bedtime.

Side Effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness, or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Each **Triaminic**® timed-release tablet contains...

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Cross section of trachea showing subglottic edema and lumen reduction due to mucous membrane congestion.

Pneumonia may also follow anesthesia administered to a patient with a cold. This can be caused by accumulated secretions becoming secondarily infected and causing consolidation of the lung. *Atelectasis* of the lung can result if one of the bronchioles becomes plugged by secretions, preventing aeration of the distal part of that lung. This is seen more frequently following upper respiratory infection because dry anesthetic gases aggravate the infection, causing secretions to change from watery to thick and viscid, and consequently difficult to suction.

Prevention of complications

The first rule to prevent complications, of course, is to use a regional or local anesthesia whenever possible. But when emergency surgery is a must, in spite of the presence of a cold, allergy, or upper respiratory infection, here are some ways to prevent complications.

Give nose drops preoperatively. This can help shrink the congested nasal mucous membranes and reduce secretions for better air passage. (Results of this method are sometimes unsatisfactory because of the short duration of effect or rebound congestion.) For longer effect, oral antihistamines with nasal decongestants are often given to provide and maintain a drying effect on secretions.

To clear the tracheobronchial tree, instruct the patient to cough preoperatively. Cold steam or water nebulizers effectively humidify the nasal, pharyngeal and bronchial passages and often make the patient more comfortable. Tenacious secretions become more watery under humidification, clear more thoroughly preoperatively and are more easily suctioned from the airway during anesthesia.

Give intravenous fluids to those patients who appear dehydrated due to a cold. In a well hydrated patient the respiratory tract secretions are less viscid and more watery. This is particularly true in asthmatics.

Summary:

Administration of emergency anesthesia to a patient with a cold or upper respiratory infection can lead to a chain of events that may result in increased postoperative morbidity and even death. This is because of the excess secretions formed in these conditions. Preoperative measures to prevent or reduce these secretions should be undertaken and will result in smoother and safer anesthesia.

An expectorant that makes coughs count by increasing respiratory tract fluid nearly 200%—plus an oral decongestant to relieve a probable cause of cough, postnasal drip. Your patients receive these benefits when you prescribe...

Triaminic® *Expectorant*

Each teaspoonful (5 ml.) contains:

Phenylpropanolamine hydrochloride	12.5 mg.
Pheniramine maleate	6.25 mg.
Pyrilamine maleate	6.25 mg.
Glyceryl guaiacolate	100 mg.
Alcohol	5%

Dosage: Adults—2 teaspoonfuls; Children 6 to 12 years—1 tsp.; Children 1 to 6 years—½ tsp Administer every four hours. Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness, or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs Use with caution in patients with hypertension heart disease, diabetes or thyrotoxicosis.

Allergy in Private Practice

Allergy can be treated. Without treatment the allergic patient may develop unnecessary complications and possibly die. The physician has a responsibility to prevent complications by instituting an effective therapeutic program to alleviate and control the allergic symptoms.

Early diagnosis is important to effective treatment. Detailed history, physical examination, laboratory studies, x-rays, and skin tests should be used to aid in identifying the responsible stimulant. The physician should then begin therapy promptly, keeping in mind the purpose of the treatment and the possible reactions.

The physician's own experience should determine his selection of the hyposensitive technique. In a two-year study of 32 patients, the author found pyridine alum-precipitated extracts superior to aqueous extracts.

There is a saying, "All that wheezes is not asthma." It can also be said, "All that sneezes is not a cold."

Allergies may present as a cold. The classical ragweed hay fever, characterized by nasal rhinorrhea, nasal congestion, and frequent sneezing, which occurs from mid-August to early October, is easily recognized. Allergic rhinitis, subclinical hay fever, or dust allergies may simulate the common cold. Chronic sinusitis often is the result of undiagnosed allergies.

Allergy is a condition of altered reactivity in response to a specific stimulant. It is an altered reactivity because it is a hypersensitivity to a substance which does not normally affect nonallergic persons. Fifteen to 20% of the population suffer major allergies;[1-2] another 20-30% have less severe allergies.[3] Thus, while about half the population have some form of allergy which warrants treatment, less than one-fifth of the patients who enter a physician's office receive such treatment.

Possible allergic conditions seen in the office include hay fever, perennial rhinitis and sinusitis, asthma, irritable bowel syndromes, and dermatitides, such as poison ivy, eczema, and hives.

Many over-the-counter cold remedies owe their effectiveness to the antihistaminic ingredient controlling the symptoms of an allergy rather than effectively treating a cold. Their failure after prolonged use usually is due to increased tolerance to the antihistaminic preparation. Often it is when these preparations fail that the patient comes to the physician for treatment of his "cold."

After a cursory examination of the chest, a brief look at the throat, and the observation of swollen, grayish-red turbinates in conjunction

with a clear or slightly yellowish mucous discharge, the physician makes a diagnosis of upper respiratory infection and prescribes antibiotics and nasal decongestant. The patient's subsequent improvement is not necessarily because of the antibiotic but possibly because the disease itself is self-limiting or the nasal decongestant has relieved his symptoms. The relief is not long-lasting, however, and the patient may again be incapacitated a few weeks later by another "cold."

Such patients should be evaluated for possible allergies.

Allergy can be treated. It should not be scoffed at or be passed over in the belief that there is no effective treatment. Untreated asthma can result in emphysema and severely limit the patient's activity. Untreated perennial rhinitis can progress to formation of nasal polyps, causing difficulty in breathing and possibly recurrent sinusitis. Untreated gastrointestinal allergies frequently create irritable bowel conditions and possibly colitis.

Treatment of allergy depends upon the early recognition of symptoms, the prompt diagnosis of the precipitating agent, and the institution of effective therapy.

Early recognition of symptoms depends upon the physician's interest in the patient's condition, his curiosity about the cause of the patient's symptoms, and his awareness of allergic conditions. Chronic sinusitis does not occur without a reason, just as no other disease occurs without a reason.

If the patient reports that his sinus difficulty begins as soon as the heat is turned on in the fall and is relieved when the heat is turned off in the spring, the physician should consider the possibility of an allergy to house dust. If a child has a running nose all winter, is irritable, and does not eat adequately, allergic nasal rhinitis should be suspected. Allergic bronchitis should be considered in the child with eczema, recurrent bronchitis, and pneumonia. Nasal congestion, watery eyes, and sneezing during May and June signal grass allergy or grass hay fever; the same symptoms occurring in March and April suggest tree pollen hay fever. The patient who has asthma attacks only during wintertime should be evaluated for allergy to house dust. Sneezing brought on by being in a damp basement might be caused by a hypersensitivity to molds.

The symptoms described by the allergic patient depend upon several factors. They include the particular antigen which stimulates the allergy; the concentration of that antigen to which the patient is sensitive and exposed; the shock organ or organs of the patient in which the antigen-antibody reaction will take place; the route by which an antigen enters the patient's system; and the response of that shock organ to the antigen-antibody reaction. House dust, for example, may precipitate sinusitis or nasal allergy in one patient yet cause rashes, asthma, or gastrointestinal disturbances in other patients. Ragweed not only causes hay fever but also may precipitate asthma. Grass may cause hay fever or it can be the cause of skin rashes. Food may cause eczema in one person, hives in another, asthma in a third person, and gastrointestinal disturbances in a fourth person. The nature of the allergic symptoms does not point to the responsible agent; further investigation must be made.

A careful history is necessary to determine the frequency of attacks, whether they occur seasonally or the year around, and whether they occur in a particular environment or under particular circumstances. Emotional conditions may precipitate an allergic reaction, but they do not cause the allergy. The patient is born with the tendency toward allergy. The development of an allergic reaction depends upon whether he is exposed to the particular stimulant to which he is sensitive. A patient's allergic condition may change during life. The child with eczema may develop hay fever in his teens and asthma in his middle age. The child with colic later may develop asthma. The child with recurrent bronchitis or frequent episodes of pneumonitis may have an allergy which is only diagnosed several years later when he develops an acute asthmatic attack.

No one outgrows his allergy. It may remain dormant for years, only to reappear when the patient enters a new environment or is exposed to high concentrations of the antigen to which he is allergic.

The diagnosis of allergy extends beyond the listing of symptoms. The ultimate diagnosis lies in identification of the offending substance based on history, physical examination, and skin tests. None of these alone is sufficient to firmly diagnose the agent responsible for a patient's allergy.

History

When an allergy is suspected, the history should be extensive and directed toward those factors which might precipitate the allergy. It should include the chief complaints, the age at onset of the allergy, whether it is seasonal or non-seasonal, paroxysmal or continuous, environmental or non-environmental. The physician should ask about other associated complaints, such as other allergies in the past or present, the age at onset, and the age at which they ceased to bother the patient. He should ask about the frequency of respiratory tract infections and particularly about operations on the respiratory tract. He should inquire into the family history for allergic conditions in both antecedents and children.

A description of the patient's attacks, including frequency, duration, and severity, should be obtained. It should be ascertained whether there are some particular disturbing factors, such as environment, seasons, diet, drugs, upper respiratory tract infections, or menstrual relationships. It is worthwhile to ask the patient what he thinks is the cause of the allergy. It is useful to know what drugs the patient has used in the past and which have provided relief.

The history should include an extensive review of the patient's general condition: whether he has gained or lost weight; whether he suffers from fatigue or digestive attacks. The diet should be reviewed in detail. Particular note should be made of those foods which might precipitate attacks in the patient, which foods the patient avoids because of consequent discomfort and the type of discomfort.

Questions pertaining to the patient's environment should disclose whether the attacks occur in different environments or whether they occur just at night when sleeping, or when housecleaning, or while at work, or at the zoo, or near horses, dogs, or cats, or whether they are precipitated by insecticides. In women it is important to learn whether the attacks occur when putting on makeup, since some of the base ingredients of cosmetics contain allergenic substances.

Such a detailed history provides important clues to the possible causes of the allergy.

Physical Examination

A careful and complete physical examination with an evaluation of all systems should be performed. Particular attention should be given to the nose: look for changes in the mucous membranes, for polyp formation, or for other evidence of chronic nasal rhinitis. Translumination of the frontal sinuses is particularly useful for screening sinus conditions.

Examination of the ears should include an evaluation of air and bone conduction. Look for evidence of hearing loss due to recurrent nose or ear infections.

A careful examination of the heart should be performed, since wheezing due to heart conditions is not easily distinguished from allergic asthma. Respiratory wheezing and hyper-resonance to percussion suggest long-standing asthma. Measurements of the circumference of the chest, both in deep inspiration and in expiration, should be made to see if any limitation of the chest wall exists. The skin should be thoroughly examined for rashes or other lesions. A careful psychological evaluation should also be made.

Laboratory studies should include more than a routine complete blood count and urinalysis. A serum protein determination sometimes points to hypo- or agammaglobulinemia as the source of recurrent nose and throat infections. A smear of the nasal mucosa for eosinophiles aids in the diagnosis of perennial nasal rhinitis. Eosinophilia in the peripheral blood, in the absence of parasite infections and other possible causes, would suggest allergies.

A chest x-ray is mandatory to evaluate the pulmonary status in the asthmatic patient. All patients over 30 with asthma and all patients over 35, regardless of their condition, should have a routine electrocardiogram. If asthma is suspected, the patient should undergo pulmonary functions studies to determine his maximum breathing capacity and changes in the residual lung volume and one-second respiratory volume. This should be done before and after the use of a bronchial dilator.

Skin Testing

Extensive skin testing is seldom necessary if a careful history has been taken. A thorough review of the patient's dietary habits aids in determining which foods precipitate allergic symptoms obviating the need for skin testing to foods.

Skin testing to foods often is unreliable,

since many patients with known allergies to certain foods produce negative skin reactions. Other patients with positive skin reaction to certain foods may have no symptoms even when devouring large quantities of that food. An elimination diet often is more effective in the identifying food allergies.

Several hundred substances are available for skin testing. These include pollens, inhalants, and contactants. Usually a logical selection of suspected antigens can significantly reduce the number of skin tests. Testing a Maryland resident to substances that are prevalent only in the far West is unnecessary, as is testing patients to substances with which they are in frequent contact which produce no symptoms. The most common substances to which patients in this area are allergic are listed in the box. This selection of antigens has been used successfully for several years at the New York University Allergy Clinic. Rarely do they have to expand this list to other substances.

INHALANTS

as used in Allergy Clinic,
New York University
Bellevue Medical Center

T & O	Horse Epithelium
Plantain	Cat
Ragweed	Horse Serum
Dust	Pyrethrum
Rabbit	Kapok
Feathers	Flaxseed
Orris	Atternia
Cottonseed	Aspergillus
Tobacco	Penicillium
Dog	Hormodendrum
	Silk

The manner of testing depends upon the physician's attitude and his experience in the type of skin testing. For several years I have used only the intradermal skin testing technique with excellent results. I find this technique more accurate and dependable than the scratch test. When done properly, it is no more painful than the scratch test, and it is as effective in children as in adults.

Sufficient caution should be taken to prevent anaphylactic reactions or severe local reactions. When a contact allergy is suspected, suitable kits are available to diagnose them by means of patch tests. These are useful only in determining what substance causes a particular type of contact dermatitis.

Some extracts may be eliminated from testing when the patient's symptoms suggest a particular substance. For example, the patient who has symptoms only between August 15 and the beginning of October does not need a whole series of skin tests to determine allergy to ragweed; nor does a patient who has symptoms only during April, May, or June warrant a whole series of skin tests. If the physician suspects that other substances might potentiate a pre-existing allergy, then it is helpful to determine what other substances might precipitate or aggravate the allergy during that particular season. Therefore, depending on the patients' history, it might be necessary to test for only one or for 20 substances. Beyond that, the results show diminishing returns.

The severity of a patient's allergy can be classified according to the degree of allergic response to a particular antigen. A suitable testing level is 100 protein nitrogen units (PNU). This provides a base line at which it is necessary to begin. If the patient has a severe reaction at this level, then a lesser dosage should be used to determine the lowest concentration which will provide the most reaction. The patient can then be placed into Class A, B, or C (as shown on Table 6). The treatment will be provided on the basis of this classification.

Therapy

If the symptoms are minimal and easily controlled with antihistamines, hyposensitization is often unnecessary. This is particularly true with seasonal allergies. But when the allergy is perennial, increased tolerance to the antihistamine and the frequent changing of antihistamine preparations often necessitates hyposensitization of the patient. In some instances of seasonal allergy, changing of antihistamine preparations may be necessary to find that preparation which will provide greatest relief for the patient. Different patients have different responses to the same antihistamine preparation.

The inherent dangers of corticosteroids, despite their refinement and varied programs, restrict their use to extreme emergencies. Long-

term corticosteroid therapy should be avoided. It should be used only as a last resort and then reluctantly.

One program of corticosteroid therapy which is highly effective in controlling acute episodes of allergy, particularly seasonal allergy, is the use of decreasing doses of prednisone, beginning with 30mg and reducing the dose at the rate of 5mg a day. This often controls symptoms throughout the season, despite the fact that the therapy is instituted for only a week. This should not be used routinely each year at the onset of the patient's allergic season, however, since it immediately creates a dependence upon the drug and gives the patient a false sense of security. Even at this low dosage some patients have developed hyperglycemia and glycosuria or hyperacidity.

Steroids should not be used in patients with known ulcers or history of ulcers. They should be avoided in cardiac patients, since most preparations cause sodium retention.

The patient receiving steroid therapy should be encouraged to undergo hyposensitization treatment. In some patients it may be necessary to anticipate long-term corticosteroid therapy. They should be given the lowest possible dose to control symptoms, and during the periods of steroid therapy, they should be given ACTH. Recent evidence indicates that providing the total for two days at one time, every other day, reduces the frequency of side effects but maintains equal effectiveness. It does not, however, reduce the need for the amount of steroids. Its effectiveness lies in its reduction of certain side effects, such as incidence of peptic ulcers, osteoporosis, and Cushingoid symptoms. A careful follow-up of cardiac, renal, adrenal, and bone status should be maintained in patients on long-term steroid therapy.

Hyposensitization

There are three basic forms of hyposensitization. The oldest type is multiple injections, requiring twice weekly injections of an aqueous antigen in gradually increasing doses. This technique has not been universally effective, possibly because of the low dosage given the patient, or failure of the patients to maintain regular appointments for their therapy, or for other reasons to be mentioned later.

In the 1940's Loveless introduced a repository one-shot therapy for controlling allergic symptoms. The program was further expanded and given greater impetus by Dr. Ethan Allen Brown in the 1950's; but this technique is still under investigation and is not available for general use, nor will it be unless certain practical problems concerning the preparation of the material and local and systemic reactions are resolved.

Initially the repository form of treatment was based on giving a high dose of a slow-releasing emulsified antigen, and this gradual release would provide increasing protection to the patient. Some investigators have altered this program by giving up to four injections during the year.

Another difficulty is that the emulsified preparation is not stable for long periods of time and it must be mixed with a particular machine to provide a precise emulsion. This is inconvenient for the average physician. Some pharmaceutical houses are investigating emulsions which have been stable for long periods of time, but their effectiveness has not been clearly defined.

Complications in the emulsion therapy include marked systemic reaction, due to the sudden release of high doses of the antigen. Several patients have developed sterile abscesses at the site of the injection.[5]

More recently, Strauss and Fuchs[6] introduced a pyridine-extracted, alum-precipitated aqueous suspension of the antigen. In 1959 they presented studies on the effectiveness of this preparation in the treatment of hay fever, particularly in patients highly sensitive to ragweed pollen. Their patients tolerated higher doses of the extract and required less injections. Subsequent studies have shown this preparation to be more effective than the previous aqueous preparation and to have fewer systemic reactions or untoward side effects. Interestingly, the eye symptoms of hay fever were greatly reduced, while the nasal complaints were only moderately reduced in some patients.

The practice of having patients receive hyposensitization injections from office nurses without ever seeing the physician, except during the initial examination and diagnosis, should be condemned. The antigen used is potent enough to precipitate sudden anaphylactic reactions and, in some cases, immediate death. If in error a dose larger than that recommended is given to an al-

lergic patient, a severe systemic reaction might occur.

Proper treatment of the allergic patient calls for careful consideration of the whole patient. Simple administration of hyposensitization shots is not enough; the physician must know of possible local or mild systemic reactions occurring after the patient left his office. He should inquire about symptoms the patient might have had during the period between injections, and he should adjust the dosage accordingly.

The physician himself should be completely familiar with the nature of the substance which he is injecting, the concentration, and the frequency of injections. This work cannot be accomplished by the nurses. Furthermore, a patient may have questions about his illness or the therapy which the nurse is not prepared to answer.

The physician who does not understand the purpose of the therapy, the expected results, and the treatment of reactions as they occur should not treat the allergic patient with hyposensitization shots, no more than a physician should perform major surgery without ever having held a scalpel in his hand. Any physician who is providing hyposensitization therapy to a patient should be prepared to treat any emergency which arises. He should have available in his office oxygen, adrenalin, cortisone, an intravenous setup of glucose and water or saline, a tourniquet, and an airway. These are necessary for the acute anaphylactic reactions which may follow injections and for possible resuscitation. Without such equipment the physician not only endangers the life of his patient but also exposes himself to lawsuits.

Evaluation of Alum-precipitated Extracts

Over a two-year period, I found that the alum-precipitated extracts had many advantages over the aqueous extracts. During that period I treated 32 patients with allergic disorders. Eighteen had first received treatment with aqueous extracts for one year and then were changed to pyridine alum-precipitated extracts. In 14 patients, pyridine alum-precipitated extracts were given initially.

The degree of improvement was classified on the basis of decrease or cessation of symptoms or prolongation of intervals between symptoms. Patients who showed moderate decrease in the severity of symptoms or had more than 50% reduction in number of allergic attacks were classified as *good*. Patients who had complete cessation of symptoms or who showed 80% or more reduction in allergic reactions were classified as *excellent*. Table 1 shows the response to treatment. There were no patients who failed to respond to treatment.

Table 1
RESULTS WITH PYRIDINE EXTRACTS IN 32 PATIENTS

Condition	Degree of Improvement	
	Good	Excellent
Allergic rhinitis	4	6
Asthma	3	5
Hay fever	—	10
Multiple allergies	1	3
Totals	8	24

Table 2
RESULTS WITH AQUEOUS EXTRACTS IN 18 PATIENTS

Condition	Degree of Improvement			
	None	Fair	Good	Excellent
Allergic rhinitis	2	2	1	1
Asthma	1	2	1	1
Hay fever	1	1	3	1
Multiple allergies	0	0	1	0
Totals	4	5	6	3

Table 2 shows the results with aqueous extracts used initially in 18 of the patients. A comparison of improvement from the use of pyridine extracts with that from aqueous extracts is given in Table 3.

Therapy was provided according to the schedule shown in Table 4. A basic series of 8-10 in-

Table 3
COMPARISON OF IMPROVEMENT USING AQUEOUS AND PYRIDINE EXTRACTS

Degree of Improvement	Aqueous	Pyridine
None	4	0
Fair	5	0
Good	6	8
Excellent	3	24

Table 4
PRESEASONAL TREATMENT SCHEDULE WITH PYRIDINE EXTRACTS (in PNU)

Injection	Class A	Class B	Class C
1	10	20	50
2	20	50	100
3	40	100	300
4	80	200	700
5	150	400	1,500
6	300	800	3,000
7	600	1,500	5,000
8	1,200	2,500	10,000
9	2,400	4,000	

Class A—Marked skin test reaction to 10 PNU/cc
Class B—Marked skin test reaction to 100 PNU/cc
Class C—Marked skin test reaction to 1,000 PNU/cc

jections was required to reach a top dose for the class. Three patients were able to tolerate 15,000 units without appreciable side effects. All patients were able to reach the maximum suggested dosage for their classification and to be maintained at this level with monthly injections. In only one patient did the dosage have to be reduced during the season of his allergy.

Table 5
IMPROVEMENT ACCORDING TO SEVERITY

	Aqueous	Pyridine
Class A	0	4
Class B	4	6
Class C	6	8
Totals	10	18

Of the 18 patients first treated with aqueous extracts, only 10 showed improvement. When transferred to the pyridine extract, all showed improvement (Table 5).

Table 6 shows the reactions to the injections.

The delayed systemic reaction which occurred in one patient with pyridine was in the form of a mild asthma attack approximately three days after injection.

I found the pyridine alum-precipitated extracts advantageous because they improved conditions previously refractory to aqueous extracts; all patients receiving it showed some degree of improvement. The frequency of side effects was minimal. Three children formerly receiving aqueous extracts preferred the pyridine extracts because of the absence of pain at the site of injection.

one 300 mg Tablet mid-evening

It's made for b.i.d.

in G.U. infections

broad-spectrum performance above and beyond the activity of ordinary tetracyclines

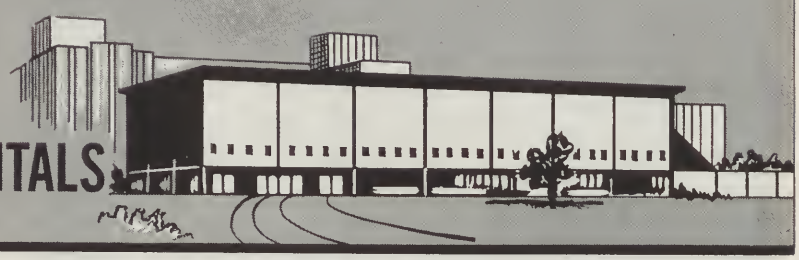
DECLOMYCIN®

DEMETHYLCHLORTETRACYCLINE

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.



Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 8.—The Bayview Asylum: Clinical Medicine (1911-1934)

For the first time in human history, a random patient with a random disease consulting a doctor chosen at random stood better than a 50-50 chance of benefiting from the encounter. (Lawrence Henderson referring to the years 1910-1912.)

Beginning of Modern Medical Era

Late in 1905, Dr. William Osler was making his last ward rounds at the Johns Hopkins Hospital before departing to become Regius Professor of Medicine at Oxford University. After he had seen and discussed the last patient, he turned to a young resident, handed him his stethoscope, and said, "Now carry on my work." The young man was Dr. Thomas Boggs who, in 1910, 10 years after his graduation from The Johns Hopkins Medical School, was appointed by the Johns Hopkins School of Medicine to become chief of medicine at the Bayview Asylum on the eve of completion of its new hospital..[1]

A second and equally important appointment was that of Dr. Arthur Shipley. A brilliant student, he went on to become resident in surgery and finally superintendent of the University Hospital. He reorganized the surgical service there and helped modernize the medical school. In the year that he was president of the Baltimore Medical Society (1910), he was appointed surgeon-in-chief at the Bayview Asylum and went about reorganizing the surgical service.

The influence of the Medical School of the

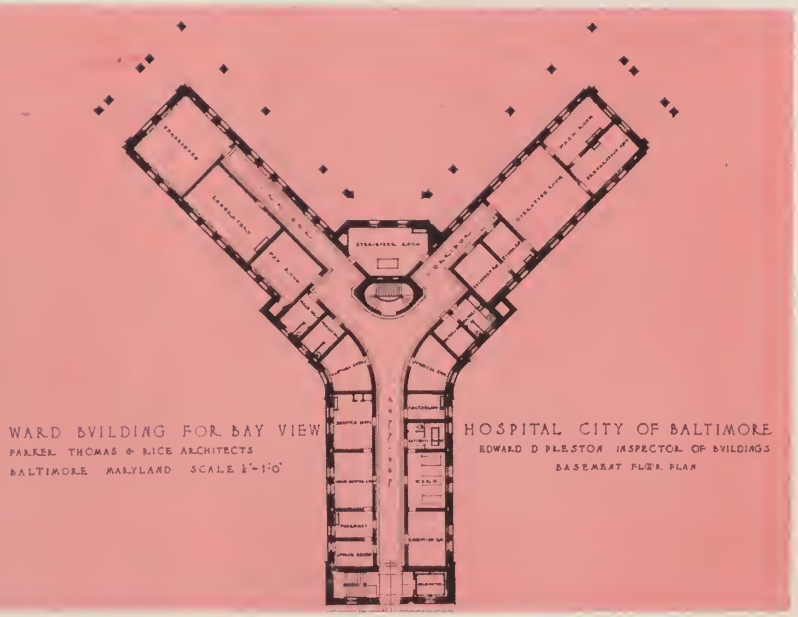


Fig 1

Plan of the New Acute Hospital (B Building) 1910. This acute hospital building resulted from the recommendations of a Board appointed by Mayor Barry Mahool in 1908. It contained four floors. The building was to be the first of four identical buildings, radiating from a central administration building which was to connect at the foot of the Y. This (present B Building) was the only unit completed.

Fig 2

Dr. William Osler's Visit to Bay View Asylum in 1913. Left to right: Drs. Thomas Boggs, William Osler, Palmer H. Futcher, Arthur Shipley.

University of Maryland on the Almshouse goes back to at least 1810. Other appontments were Dr. Milton Winternitz as pathologist-in-chief, Dr. Gordon Wilson as chief of the Tuberculosis Sanitarium, and Dr. Esther Richards as psychiatrist-in-chief.

On July 1, 1911, the new medical and surgical wards were opened in what is now the south wing of the B Building. Architecturally, the hospital was in the very forefront of hospital construction for the time. On the first floor, a surgical suite occupied the southwest wing, while clinical laboratories took up the southeast wing (Fig 1).

The following years were productive of good medical care and house staff teaching. Dr. Boggs was particularly interested in the house staff and the students. His book plate showed an old and a young ox pulling a plow together with the legend *A BOVE MAJORE DISCIT ARRARE MINOR* (The young ox learns to plough a straight furrow by working beside an old ox) (Fig 3).

Dr. Boggs was a capable botanist, an outstanding clinician, and a stimulating teacher. During the First World War, he served as chief medical officer in Base Hospital 18. In 1937, he became president of the Association of American Physicians.[2, 3]

It was sometime after the First World War that the better hospitals became accepted as places to regain health rather than places to die. Improved methods of diagnosis, such as x-ray photography, basal metabolic rate determination, and operating rooms made it essential that the patients come to the hospital for serious illnesses. In a previous age, medical practice consisted of the physician's interview and examination at the bedside. His only resources were carried in a small bag, and cheap high quality care could be rendered in the patient's home. With the development of complicated diagnostic measures, it became necessary for the seriously ill patient to come to the hospital.

Another influence changing the attitude toward the hospitals was the understanding, development, and control of infections. Introduction of antiseptic and, later, aseptic techniques made hospitals increasingly safe places for treatment. At first, the private hospitals were largely filled with surgical patients. In the nineteenth century, medical patients were still taken care of at home by their family doctor.[4]

In October, 1911, a nurses training school was opened.

A number of problems plagued the institution. A new problem was insufficient living space for nurses and doctors. The old chronic problem of insufficient patient space remained.

In 1913, there was but one telephone to the three hospitals (infirmary, tuberculosis sanitarium and B Building) with a population of 1,500 people. There were increasing needs for laboratory examinations and particularly for an X-ray Department. During 1916, the increasing number of admissions of insane patients made the hospital even more crowded.

During World War I, because of the shortage of physicians, fourth year medical students were called on to care for patients. In 1917, both Dr. Boggs and Dr. Shipley left for service in

the Medical Reserve Corps. In the same year, Dr. Winternitz left to become professor of pathology at the Yale Medical School. Dr. Boggs was replaced by Dr. Thomas Sprunt, who was later replaced by Dr. Charles Austrian. In 1919, Drs. Boggs and Shipley returned to find a new X-ray Department installed, but so typical of poor coordination, there was no salary for a technician. In the 10 years after the war, Drs. Boggs and Shipley, helped by a number of other physicians, continued the work of patient care and teaching.

In 1925, the name of the Bayview Asylum was changed to Baltimore City Hospitals. This change recognized on the one hand the decreasing number of insane patients being cared for and, on the other, the growing medical care being rendered to the poor both on the wards and in the Outpatient Department. Doctors Boggs and Shipley reported in 1926, "The Chronic Wards have been expanded beyond the limits of propriety and strict honesty. . . . This situation is an urgent reality. . . . It is impossible to maintain morale. . . . The city will not do its duty toward the sick poor. . . . First and last the solution lies in adequate personnel, adequately paid."

Over the next few years, with increasing difficulties, the work was carried on. As has so often happened in the history of the hospital, the buildings were allowed to deteriorate, morale was allowed to fall, and complete deterioration of the organization was in view before the situation was faced.

Finally, in 1929, overall plans were made to construct a new general hospital, tuberculosis sanitarium, service building, and nurses' home.

In 1924, a plea was made for social service in the hospital. The question was asked as to what could be done to re-establish patients in the community. The use of social workers, cooperation with other agencies within the city, and occupational therapy within the hospital were recommended as measures to help patients reach the point where they could care for themselves.

In 1927, the needs of the hospital were forcefully presented by the staff. The point was made that Baltimore paid less per day for the care of its welfare patients than any other large city in the country. Three years later, the city responded by expanding its facilities and buildings and meeting its responsibility of housing the sick poor.

Fig 3
Bookplate of Dr. Thomas Boggs.

In the 1928 report, Superintendent Longan outlined the functions of the municipal hospital as 1) the appropriate care of patients, 2) teaching of all types of hospital personnel, and 3) contribution to medical knowledge through properly kept records and research.

The period from 1911 to 1934 at the Baltimore City Hospitals was characterized by the practice of superior bedside medicine. The physicians who were leaders at the Baltimore City Hospitals were the flower of American medicine. Dr. Boggs became president of the Association of American Physicians, the highest accolade in American medicine; Dr. Shipley had been president of the Baltimore City Medical Society in the year of his appointment to the Baltimore City Hospitals (1910); Dr. Gordon Wilson was one of the leading phthisiologists of America; Dr. Milton Winternitz became professor of pathology at Yale; Dr. Esther Richards remained a leading American psychiatrist throughout her life. All of these physicians were particularly interested in the professional training and personal success of their house staffs. Young doctors from across the United States came to work at the Baltimore City Hospitals.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension: Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

WASHINGTON COUNTY

May 19 was Ladies' Night. The members of the Washington County Medical Society invited their wives for cocktails and dinner. They heard a most interesting talk by **E. T. Lisansky, MD,** on "How to Take a History." He played a taped interview with a patient to illustrate how best to obtain information about the patient's symptoms and his background. Dr. Lisansky is associate professor of medicine and clinical psychiatry at the University of Maryland.

A special guest was **Mrs. Anna Mae Marshall,** who recently retired from nursing duties at the Washington County Hospital. She was presented with a plaque from the Washington County Medical Society in honor of her 30 years of service to the hospital, patients, and physicians of Washington County.

A resolution of respect in memory of **Walter Hal Shealy, MD,** who died on April 15, was read and made a part of the permanent records of the Society.

* * * * *

The Washington County Medical Society will cooperate with the Mayor's Council on Problems of the Aging. Its first project was approving the use of a hearing testing trailer for older citizens during the summer months. **George Comstock, MD,** has been appointed to represent the Society on the Advisory Committee to this Council.

* * * * *

E. W. Ditto, III, MD, chairman of the Physicians Procurement Committee, has interested several young physicians in coming to Hagerstown to practice medicine.

* * * * *

Johns Hopkins Hospital is conducting a research project, "Genetic Studies in Washington County." The purpose is to determine the frequency and type of hereditary diseases in our county. The investigators are **Mohsen Mahloudji, MD,** and **Bruce Konigsmark, MD.**

* * * * *

The Medical Technology Resolution 2A/66, initiated by **Frederick W. Shillinger, MD,** of the Pathology Department of the Washington County Hospital, was adopted unanimously by Med-Chi at its annual meeting on April 29. This resolution concerns training for medical technologists at the college level.

* * * * *

Mary Ann Prisak, a recent graduate of North Hagerstown High School, was the recipient of a scholarship awarded annually by the Washington County Medical Society. Miss Prisak plans to study medicine and will enter the University of Maryland this fall.

* * * * *

Archie Cohen, MD, has assumed office as a Councilor of the Medical and Chirurgical Faculty from this area.

John W. Clark, MD, DDS

For multiple contraceptive action

Norinyl® tablets

(norethindrone 2 mg. c̄ mestranol 0.1 mg.)

multiple action that has produced a record of unexcelled effectiveness

inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.

plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

THE AUTOMATED CLINICAL LABORATORY

Application of modern electronics and mechanics is stimulating rapid development of automatic processing of specimens, performance of tests, and reporting of results. The problems of ever-increasing laboratory workloads and critical shortage of laboratory manpower can be solved only by automation. But just as important is the significantly increased quality control and reliability of test results and the reduction of manual transcription errors offered by well-designed automatic systems.

Automated systems are under development in several medical centers, where all the paper work related to specimen handling (work lists, etc.), test result calculations, and printing of reports is handled by a data processing system.[1, 2]

In other laboratories, equipment has been designed to include automatic accessioning of blood samples by machine and subsequent identification, chemical assay, computation of results by scaling to appropriate standards, and print-out of complete reports. Processing is handled entirely by machine and computer.[3, 4]

Computer programs have been written to compare the new test result with the previous result on the same patient and to print out a warning if the difference exceeds accepted normal range or predetermined limits. Other useful programs to evaluate laboratory data and thus assist the clinical pathologist and patient's physician are being developed.[5]

These innovations in laboratory medicine will greatly increase the value of clinical pathology in every day medical practice and permit the every day use for patient care of many sophisticated procedures previously limited to research.

The same advances in automatic laboratory systems which can serve us so well make it possible for business and industry to enter the field of clinical laboratory services and provide reliable quality controlled test results. Already several industrial corporations are organizing to offer laboratory service at costs not subject to the expenses of training residents, absorbing charity work, teaching medical students, training technologists, and providing clinical pathology consultation. Particularly during the next few years, when the Medicare program produces enormous demands

NURSING HOME

24 hour professional care

Registered nurses

Physical therapy facilities

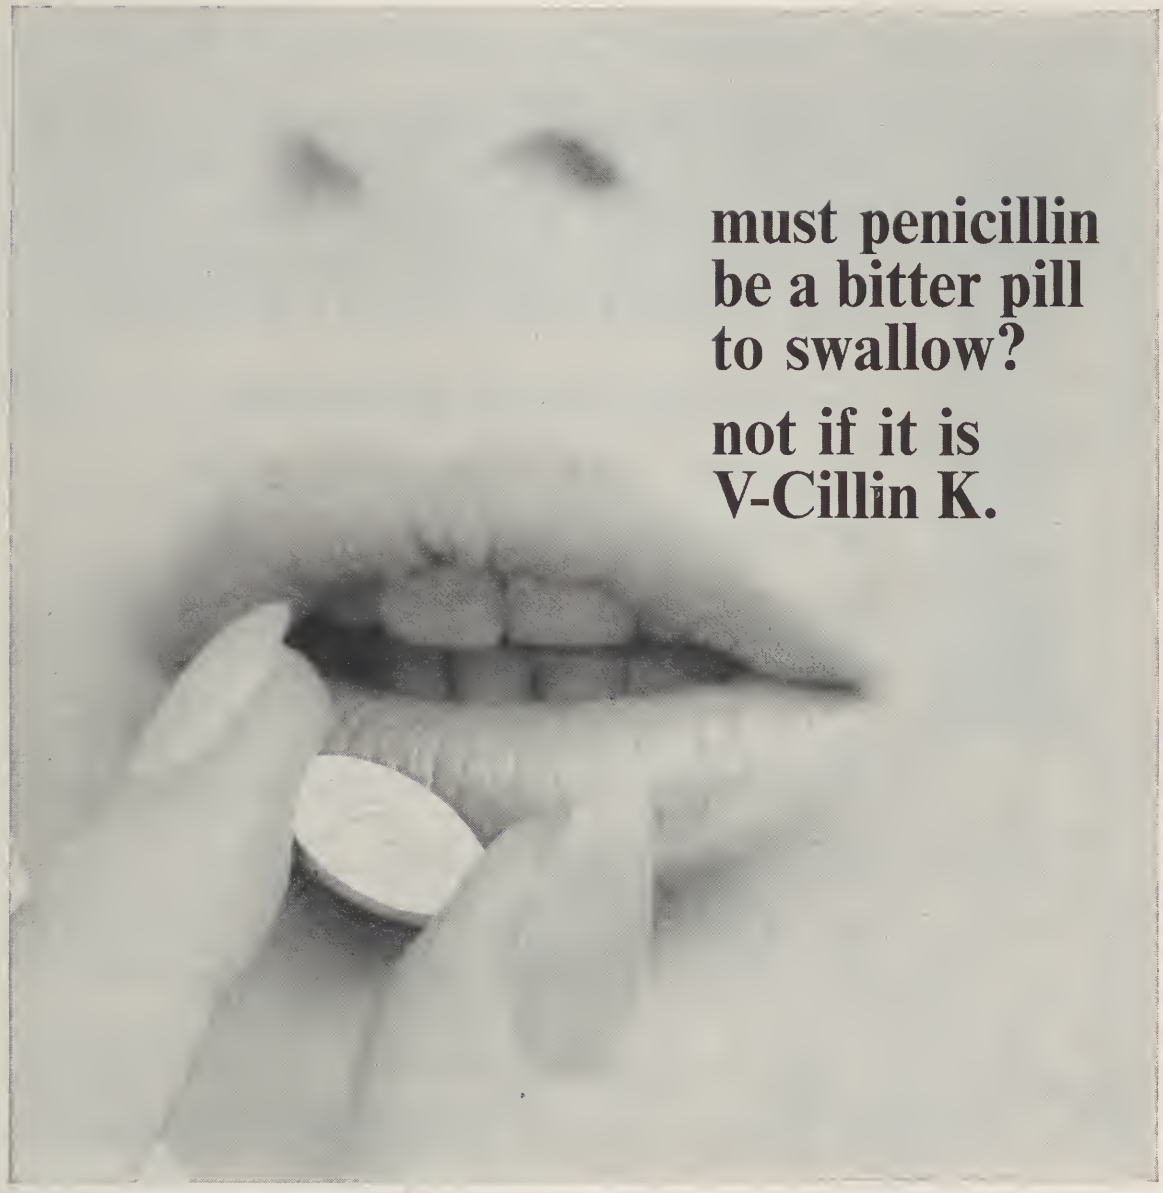
Pleasant and distinctive atmosphere

Warm, cheerful hospitality

The cost is moderate

Chesapeake Manor Nursing Home introduces a new standard of dignity and pride for convalescents. Family-fashion rooms and pleasant informal lounges avoid all sense of the institutional. Excellent facilities and competent personnel assure the comfort and care you would wish for your family or friends.

509 East Joppa Road — Towson, Maryland, 21204 — Phone 828-9494



for laboratory work which cannot be immediately met by existing clinical pathology laboratories, there will be ample opportunity for industrial and commercial laboratories to develop their assay business. However, they can never provide the most important constituent of a clinical pathologist's contribution to comprehensive laboratory care of the patient: that of interpretative consultation based on medical training, and familiarity with the medical history and current physiology of the individual patient.

More and more in the future, the chemical, hematologic, immunologic, and genetic data for any one patient will grow in volume and complexity ("molecular" diseases, genetic biochemical anomalies, endocrinopathies, metabolic changes, physiologic homeostatic states) requiring knowledgeable correlation and expert formulation into profiles and patterns useful to the bedside physician. This is the clinical pathologist's most important task; he must attain surpassing excellence in this aspect of laboratory medicine. This essential professional service to the patient's physician can never be provided by anyone other than a well-trained laboratory physician.

Thus, we clinical pathologists must develop still further our skills and intimate knowledge in pathologic physiology, chemistry, and biology, and in the correlation of complex patterns of tests and their practical formulation for our colleagues at the bedside; we must participate in the consolidation of hospital and private laboratories into groups for more efficient and economic utilization of automation and available skilled technical and professional manpower; only thus can we improve the quality, reduce the cost, and provide the high level of laboratory care every patient needs.

V-Cillin K now has a unique glossy coating that banishes bitter penicillin taste and makes it easier to swallow. Within six seconds (just long enough for the tablet to get past the taste buds), the coating dissolves and the penicillin is ready for immediate absorption into the bloodstream. The patient still gets all the special benefits of V-Cillin K, including consistent dependability . . . even in the presence of food.

Indications: V-Cillin K is an antibiotic useful in the treatment of infections caused by streptococci, pneumococci, and sensitive strains of staphylococci.

Contraindications and Precautions: Although sensitivity reactions are much less common after oral than after parenteral administration, V-Cillin K should not be administered to patients with a history of allergy to penicillin. As with any antibiotic, observation for overgrowth of nonsusceptible organisms during treatment is important.

Usual Dosage Range: 125 mg. (200,000 units) three times a day to 250 mg. every four hours.

Supplied: Tablets V-Cillin K, 125 or 250 mg.; also, V-Cillin K, Pediatric, 125 mg. per 5-cc. teaspoonful, in 40, 80, and 150-cc.-size packages.

Myocardial Failure Secondary to Shock

JOSEPH S. McLAUGHLIN, MD
ARLIE MANSBERGER, MD
R ADAMS COWLEY, MD

A rationale for resuscitation of critically ill hypotensive patients based on the correction of pathophysiologic and biochemical derangements is presented. The successful use of this approach to therapy is illustrated to emphasize the problem of secondary myocardial failure in shock.

Shock from myocardial infarction is well known and readily recognized. Not so well known and frequently unrecognized is myocardial failure due to shock. The following case report is an example of myocardial failure secondary to septic shock. It illustrates our approach to therapy as carried out in the Shock Trauma Unit at the University of Maryland Hospital.

CASE REPORT

An 85-year-old Negro man was admitted to the University Hospital with the chief complaint of pain in the left lower part of the abdomen of about two months duration. Physical examination revealed a pulsatile mass in the left lower quadrant of the abdomen. A translumbar aortogram demonstrated this to be an aneurysm involving the left common, internal, and external iliac arteries. The patient's general health otherwise was remarkably good.

On March 4, 1965, with the patient under general endotracheal anesthesia, the aneurysm was resected and replaced with a Teflon prosthesis. The patient tolerated the procedure well and spent a comfortable first post-operation night.

The next morning both feet and hands were cold and he complained of pain in the left leg. The arterial blood pressure was 120/80 and the central venous pressure (CVP) was 3 mm Hg. Vasoconstriction resulting from hypovolemia was adjudged to be present, and two units of plasma were administered. The central venous pressure increased to 10 mm Hq during the plasma infusion, and 2 mg of digoxin was administered intravenously in divided doses. During the next 24 hours there was continued improvement; the pulse and arterial blood pressure remained stable at 100 and 140/90, respectively, and the CVP fell to 4 mm Hg. On the second postoperative day, oral feedings were begun and chair ambulation was well tolerated.

On the morning of March 8, the indwelling

From the Clinical Shock Unit, Department of Surgery, University of Maryland School of Medicine, Baltimore. Supported by U.S. Army Research and Development Command Contract No. DA-49-193-MD-2229.

Foley catheter was removed from the bladder and was later reinserted because of patient's inability to void spontaneously. Later the same morning the patient's blood pressure fell to 80/60 when the attendants lifted him from the bed into a chair. He was returned to bed and given three 5 mgm doses of metaraminol, which brought about transient elevations of the systolic arterial blood pressure to 110 mm Hg. The central venous pressure rose to 6 mm Hg. An electrocardiogram did not indicate myocardial infarction; a chest roentgenogram showed no change from previous examinations. Hypovolemia was again suspected, and 600 cc of plasma was carefully administered. Nevertheless, the blood pressure remained at 80/60. After plasma infusion, the CVP rose to 14 mm Hg. Rales were noted in the posterior lung fields bilaterally, and the patient became anuric.

Eight hours after the onset of anuria, the patient was seen in consultation by a member of the Shock Trauma team and transferred to the Shock Trauma Unit. Initial laboratory examinations revealed a normal acid-base balance and normal electrolyte levels. A diagnosis of septic shock from bladder catheter manipulation was entertained.

Blood cultures were obtained. Hydrocortisone (1 gm), chloramphenicol (4 gm), and digoxin (0.25 mg) were administered intravenously. No improvement occurred, so an isoproteranol infusion was initiated (0.2 mgm in 200 cc of 5% dextrose and water). At an infusion rate of 0.5 μg/min the arterial blood pressure increased to 110/80 and the CVP fell to 8 mm Hg. Subsequently 500 cc of 5% dextrose and water was administered over a 30-minute period with only a slight elevation of CVP.

Anuria persisted despite the water load, and 10 gm of mannitol (50 cc of 20% solution) was given. The CVP rapidly climbed to 12 mm Hg, but throughout the next 45 minutes the patient excreted 25 cc of urine, an amount equal to the entire urinary output for the preceding 12 hours. The CVP rapidly rose to 13 mm Hg but the urinary output during the next hour was 50 cc. In the following hour the patient excreted about 100 cc of urine, the blood pressure rose to 120/80, and the venous pressure fell to approximately 7 mm Hg. Decreasing amounts of isoproteranol were necessary, and the infusion was discontinued after six hours. A unit of plasma and approximately 1000 cc of 0.5 N saline solution were infused during this time.

By the following morning the patient's blood pressure was stable at 120/80, the pulse was approximately 90 per minute, urinary output was adequate, and his overall condition appeared quite good. The blood culture obtained the preceding morning grew *E coli.*

COMMENT

Cardiac failure in hypotensive patients is common. MacLean[1] recently reported hemodynamic data from a series of 20 patients in shock from various causes; in 10 of these patients, cardiac failure was a prominent factor. Our experience has been similar. We have become increasingly aware of the need to support the myocardium, particularly in elderly patients and in persons in septic shock.

Myocardial failure may be the cause (primary myocardial failure) or the effect (secondary myocardial failure) of shock. Primary myocardial failure most commonly results from coronary occlusion and myocardial infarction. The initial muscle injury causes decreased cardiac output and a lowering of blood pressure, which in turn decreases coronary blood flow and further injures the myocardium. Vasopressors may reverse the process by increasing peripheral resistance and arterial blood pressure. Coronary blood flow is increased, and the better nourished myocardium then may compensate for its injury.

A similar vicious cycle may occur in the hypotensive patient without infarction.[2] Decreased cardiac output and blood pressure diminish coronary blood flow, which injures the myocardium and produces a decrease in myocardial contractile force. Diminished myocardial contractile force lowers the cardiac output and the blood pressure even further.

Our approach to the problem of secondary myocardial failure in shock is based on correcting the presenting pathophysiologic abnormalities.[3] First we correct volume deficits and acid-base and electrolyte imbalances to allow the endogenous catecholamines to act effectively. Blood pressure and cardiac output are raised and coronary artery blood flow is increased. Adequate oxygenation

of the blood is essential. If hypoxia exists or if the patient is laboring in respiration, tracheostomy is performed. Not only do these procedures assure adequate oxygenation but, equally important, they abolish the work of breathing. If the central venous pressure increases abnormally during therapy, digoxin is administered intravenously. If the patient remains hypotensive and the central venous pressure continues to rise, circulatory support by adrenergic stimulating drugs is indicated.

Two types of adrenergic receptors exist in the human circulatory system.[4] Alpha receptors produce peripheral arteriolar constriction but have no direct effect on the myocardium. Beta receptors produce arteriolar dilatation and have a positive ionotrophic effect on the myocardium. Since vasoconstriction and decreased tissue perfusion are two of the pathophysiologic abnormalities in shock, alpha adrenergic stimulating drugs appear to be contraindicated. (Metaraminol acts predominantly by releasing norepinephrine, which is both an alpha and a beta stimulator.) Beta adrenergic stimulating drugs, producing both increased myocardial contractile force and arteriolar dilatation, theoretically should be ideal. Isoproteranol is a beta adrenergic stimulator. In the presented case it increased arterial blood pressure and decreased central venous pressure, indicating increased myocardial efficiency and cardiac output. In addition, the urinary output which had been virtually nil for the preceding several hours increased markedly. Mannitol undoubtedly was largely responsible for the diuresis, but without the improved myocardial function, the additional volume expansion associated with mannitol infusion would have been hazardous.

The Science of Communication
as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

tomy of
Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions, carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

Uses and Abuses of Bed Rest

There was a young athlete named D.
Who was clapped into bed for TB.
After months in the sack,
He had pains in the back,
And his bones turned to stones in his P.

The advent of Medicare and the Utilization Review in hospitals brings increasing concern about the indications for prolonged bed rest in hospitals. There has been a great deal of talk about the uses and abuses of bed rest but little scientific investigation of its general effects and specific indications.

In a recent excellent publication, Dr. Norman L. Browse,[1] lecturer in surgery at the Westminster Hospital and Westminster Medical School, London, reviewed the physiology and pathology of bed rest. His main purpose was to stimulate research in the physiology of bed rest and to expose its dangers. The book is clinically oriented and reviews recent studies of circulation, ventilation, excretion, and metabolism associated with bed rest.

In hospital planning, the number of beds needed is a leading consideration. Ten times as many patients go through an out-patient department, and many in-patients need the bed only for sleep at night.

The bed is still "king of modern medicine."

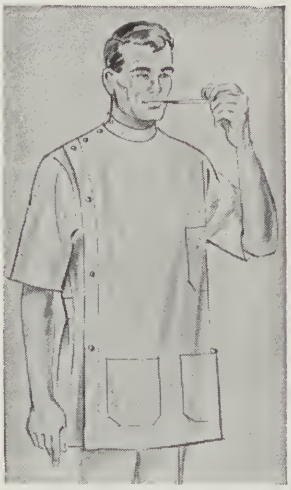
The established reasons for prolonged bed rest are to relieve pain, to immobilize wounds and fractures, to overcome the effect of gravity (as in ankle edema or with orthostatic hypotension), and to provide support for people who are completely paralyzed, too weak, or too tired to sit or stand.

Often prolonged bed rest is used without any real evidence that it is of help, as in acute rheumatic fever, pulmonary tuberculosis, liver disease, peptic ulcers, cerebrovascular accidents, and infections after the acute febrile illness is over.

Current medical knowledge offers more proof that bed rest is overused than that it is underused. Some of the deleterious effects of bed rest are thought to be the development of deep vein thromboses and pulmonary thromboembolism, aspiration pneumonia, pressure ulcers, contractures, constipation, difficulty with micturition, renal calculi, osteoporosis, generalized weakness, and depression. Many of these complications, however, may be related to the wasting and deterioration caused by the disease which necessitated bed rest.

Few controlled trials comparing patients on and off bed rest have been performed. Weir[2] compared 200 patients with pulmonary tuberculosis treated with antituberculosis drugs. Half were kept in bed and the other half were ambulatory. There was no difference in the clinical results obtained in the two groups.

A number of studies have been performed in patients with hepatitis to estimate the effect of exercise, but the results are not clear cut between the two groups.[3]



Patients with peptic ulcers are often treated

by bed rest and medical treatment while the healing of the ulcer is observed radiologically. There is no evidence that the bed rest itself has value, although removing the patient from his family and the working environment may be important. Pollard and Summerskill[4] studied 66 patients with melena or hematemesis. Half were mobilized one week after bleeding stopped. There was no difference in the rate of recovery.

In rheumatoid arthritis particularly, we have been shocked by patients arriving in the hospital twisted like pretzels and giving a history of prolonged bed rest with no effort at mobilization of any of the joints.

In 1952, Levine and Lown[6] started a movement toward early armchair treatment of patients after myocardial infarction, pointing out the higher cardiac output and other advantages of early armchair mobilization.

More studies of comparable series of patients, one group treated with bed rest and one without, are needed in view of the need for efficient use of available hospital beds.

in chronic illness

B and C vitamins are part of therapy: An imbalance of water-soluble vitamins and chronic illness often go hand in hand. STRESSCAPS capsules, containing therapeutic quantities of vitamins B and C, are formulated to meet the increased metabolic demands of patients with physiologic stress. In chronic illness, as with many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:	
Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

CHARMS THE HYPERACTIVE COLON

CANTIL®

(mepenzolate bromide)

helps restore normal motility and tone

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide) —25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL —containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

RAY HEPNER, M.D., Editor

Anabolic Sex-Related Steroids in Cystic Fibrosis

Methandrostenolone in individualized large dosages produces consistent increments of height and weight in children with severe fibrocystic disease. • Injections of beta estradiol valerate used concomitantly with methandrostenolone has been followed by marked anabolic state where methandrostenolone by itself appeared ineffective. • Norethindrone has resulted in good anabolic response in one case. • Rapid advance in bone age and side effects of androgenization and estrogenization have occurred. • This degree of sex-related anabolic therapy should be used in cases in which the threat to life or chronic invalidism is sufficiently great to warrant development of effects expected in sex hormone therapy in children.

THOMAS A. GOOD, MD
SAMUEL P. BESSMAN, MD

Children with advanced cystic fibrosis of the stand the rigors of their disorder if their nutrition tion. The development of severe anorexia and psychic depression too often heralds death.

To see if these children would be able to withstand the rigors of their disorder if their nutrition were improved, we attempted artificial appetite stimulation with the anabolic steroid methandrostenolone (Dianabol) in a patient who appeared to be in a preterminal stage. This 9-year-old girl showed a striking response in weight and growth, and for a year her acute lower respiratory tract condition improved. Indeed, it was the first year in the past two years that she responded to antibiotics, mist, and postural drainage to the degree that she was virtually asymptomatic. Clubbing of her fingers was greatly reduced, and she enjoyed good health until the steroid dosage was reduced from 10 mg per day to 2.5. She again developed anorexia, weight loss, and lassitude in association with superimposed pneumonitis.

Because reinstitution of 10 mg of methandrostenolone to an intense fibrocystic disease regimen failed to improve her condition after one month, estrogenic therapy was added in the form of injections of 20 mg of beta estradiol valerate (Delestrogen) in oil every two weeks. She responded to this medication, and in the 20 months subsequent to the initiation of combined anabolic androgen and estrogen therapy she has enjoyed good health, withstood several attacks of respiratory infection, and has shown gratifying growth in weight and height. She is taller than her mother and, therefore, will not be dwarfed by the rapid epiphyseal closure that has occurred on androgenestrogen therapy.

Because of this patient's response to methandrostenolone, we have treated a total of 10 patients with similar results. The table summarizes experience with six patients who have been treated for long enough periods to allow evaluation. In two cases estrogens were added, as in the first case. Additionally, the progestational hormone (17 hydroxy progesterone caproate—170HPC) has been used in an effort to delay epiphyseal closure and, perhaps, to change the character and quantity of respiratory mucus production. Patient 2 did not show a good response until 170-HPC was added to the regimen. Patient 3, treated with large dosages of progestational hormone and relatively small dosages of estrogen and ana-

From the Pediatrics Research Laboratory, University of Maryland School of Medicine, Baltimore.

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

WARMTH FOR COLD HANDS AND FEET

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

K. Merrill Sumey, Resident Manager

bolic steroid, did not rally and died after eight months of combined therapy. Her initial response to methandrostenolone had been good, but because of her young age and marked advancement of bone age on methandrostenolone, we hesitated to use large dosage androgenic-estrogenic therapy when she became apparently unresponsive to methandrostenolone.

In patient 6 we used the progestin norethindrone (Norlutin) to observe the combined effect of an anabolic estrogenic progestational hormone. This child has done remarkably well with rapid spurt of height and weight. Control of acute lung infection has been possible with sodium nafcillin and sulfasoxazole. He has been treated with 5 mg of norethindrone per day for eight months and continues to improve in nutritional state and activity tolerance. Serial x-ray examinations have shown reduction in evidence of cor pulmonale and clearing of acute changes indicative of pneumonia.

The dosage of sex-related steroid hormones used has been greater than the recommended dose for usual cases in which anabolic effects are desired without serious secondary sexual characteristics. Since we are attempting to save children from life-threatening fibrocystic disease and its complications, we have accepted as side effects the expected results of treatment with sex hormones. Estrogens have helped where androgenic anabolic steroid therapy alone has become ineffective.

Other investigators have recently demonstrated that small amounts of anabolic steroids in less severe cases are effective in improving nutritional status in cystic fibrosis without marked androgenic side effects (Dennis and Panos, University of Arkansas). Our experience has shown that for advanced cases in which lower respiratory infections are constantly present, larger dosages are necessary to pull the children "out of the hole" so that they may respond to fibrocystic regimens. As their nutrition improves, they become less troubled with lower respiratory tract infections, even though they continue to harbor flora of staphylococci and pseudomonas.

GENERIC AND TRADE NAMES OF DRUGS

Estradiol valerate—*Delestrogen*
Methandrostenalone—*Dianabol*
Nerethindrone—*Norlutin*

In fact, there's as much iron...250 mg.
...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood.
When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

WHAT'S THE COMMON DENOMINATOR? ...IRON

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses. Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

DEPARTMENT OF HEALTH

STATE OF MARYLAND

William J. Peeples, MD, MPH, *Commissioner*

Highlights

COMMISSIONER NAMED TO ADVISORY COMMITTEE

William J. Peeples, MD, has been named to a nine-man advisory committee designed to strengthen relations between the Department of Health, Education, and Welfare and the 50 state health agencies.

In announcing the membership of the newly created committee, Secretary of Health, Education, and Welfare John W. Gardner said the committee would:

- Examine the nature of the existing relationships between the Department and the state health agencies;
- Identify existing problems and proposals for their solution;
- Report its findings to the secretary.

Other members are from New York, Illinois, Georgia, California, Ohio, Pennsylvania, and the District of Columbia.

TEMPLE UNIVERSITY MEDICAL CENTER
presents the 10th Annual Postgraduate Course

RECENT ADVANCES IN MEDICINE

11:00 A.M. to 4:00 P.M.
on
8 consecutive Wednesdays
from
October 26 to December 14, 1966

The course will consist of seminars, panel discussions, clinics, lectures and ward rounds considering subjects of interest to the family physician. Several distinguished out of state authorities will participate.

Enrollment limited. Registration fee: $50.00

For further information and curriculum, write to:

DEPARTMENT OF MEDICINE
TEMPLE UNIVERSITY HOSPITAL
Philadelphia 40, Pa.

ALBERT J. FINESTONE, M.D.
Director of Postgraduate Course

ROCKY MOUNTAIN SPOTTED FEVER

The fact that 10 cases of Rocky Mountain spotted fever had been reported in Maryland by the start of summer, signalled the possibility of a higher incidence this year. Nine cases occurred in the counties and one in Baltimore City.

In May, the State Health Department issued a press release warning the public to avoid areas where ticks are likely to abound, especially during the late spring through the summer months when ticks are most prevalent. Persons who are particularly subject to this seasonal hazard include vacationers, campers, picnickers, sportsmen, and those who work in wooded or bushy areas. The press release described symptoms of spotted fever and advised readers to consult a physician if such symptoms occur.

Since 1930, when Rocky Mountain spotted fever first was recognized in Maryland, 1,262 cases and 180 deaths have been reported from all parts of the state except Allegany and Garrett counties.

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

During the last 10 years, there have been approximately 20 cases each year, with two fatal cases in 1962, and one in 1963 and 1964. In 1965, 21 cases were reported for nine counties in the central area of the state and Baltimore City.

MARRIAGE AND DIVORCE STATISTICS

In 1965, 47,345 marriages were performed in Maryland. This is an increase of 4% over the previous year. The number of women who married at 18 accounted for the major part of the increase. In 29,383 ceremonies, at least one party was a Maryland resident; in 17,962, both were from out of state. The number of marriages between two nonresidents was 24 less than in 1964.

Approximately 78% of all brides and 77% of all grooms married in the state last year were married for the first time. Of these, 51% of the brides were teenagers, and approximately 72% of the grooms were under 25.

Absolute divorces and annulments granted in Maryland last year totaled 6,978, a 4% increase over 1964. Approximately 47% of the couples to whom absolute divorces or annulments were granted had been married 10 years or more.

AIR QUALITY CONTROL

Federal funds amounting to $21,868 to supplement the Metropolitan Baltimore Air Quality Survey have been allowed, as well as funds in the amount of $225,000, as of July 1, to continue the survey into fiscal year 1967.

A study planned for the City of Columbia in Howard County has been started with one station at Simpsonville.

CHRONIC DISEASE HOSPITALS

Charles Winnacott, MD, of Salisbury, has joined the staff at Deer's Head State Hospital. He has been in general practice for 17 years. Andrew C. Mitchell, MD, another Salisbury practitioner, also joined the staff. These appointments fill the existing positions at this hospital with licensed physicians.

The problems of obtaining adequate hospital personnel at all levels remain acute. Particularly critical is the shortage of male attendants at all hospitals and the shortage of registered nurses at Montebello. There are also unfilled positions in social service, medical records, and many other areas which seriously threaten full operation.

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

COMMISSIONER

American Building, Baltimore and South Streets
Baltimore, Maryland 21202

752-2000: Extension 307

Learn To Do Your Part In The Prevention Of Disease

New Ambulance Regulations

The City Health Department has adopted new rules and regulations governing the use of ambulances in Baltimore City. Effective July 1, the new regulations implement City Ordinance No. 734, introduced by Councilman James J. Duffy of the 1st District and signed into law by Mayor McKeldin on January 28.

These regulations apply to all ambulances operated in the City of Baltimore with the exception of Fire Department ambulances. In general, they spell out license requirements and procedures for operators, attendants, and drivers, standards of ambulance equipment and maintenance, required and recommended reports, and the continuing inspections to assure compliance. These regulations follow the recommendations of the American Association for the Surgery of Trauma, the National Safety Council, and the American College of Surgeons.

Each ambulance, for a brief and often critical period, is a mobile sickroom; but its occupants have no direct supervision by physicians or nurses. The ordinance and regulations are designed to standardize both ambulance operation and equipment in the city in order to provide a more sanitary and orderly service for litter cases and to insure competent attendants for the sick and injured.

Additional information regarding the ordinance and regulations may be obtained from John B. De Hoff, MD, director of local health services in the City Health Department, Telephone 752-2000, Extension 309.

Dr. H. Maceo Williams Retires

On July 14, H. Maceo Williams, MD, retired from duties as administrative health officer with the Baltimore City Health Department.

A dedicated public health official, Dr. Williams came to the City Health Department in 1939, when he was appointed the first administrative health officer of the then newly established Druid Health Center, at 1313 Druid Hill Avenue.

Through his leadership, working in the community with medical and other groups, Dr. Williams has made invaluable contributions not only to the health of the residents of his area but to all Baltimore. In 1950, as the needs became more evident, the Druid Health Center operations were enlarged when a new Druid Health District was designated with Dr. Williams as the Health Officer. In 1961, a new and modern health center was opened at 1515 West North Avenue.

As the administrator of health services in an area with many health problems, ranging from high infant mortality to lead paint poisoning, tuberculosis, and venereal diseases, Dr. Williams, with typical thoroughness, applied himself and his growing staff to the tasks at hand and helped achieve new health records for this inner section of the city. Polio and lead paint poisoning are no longer the problems that they were, and the current infant and maternal mortality is among the lowest the city has seen.

Dr. Williams was born in Baltimore in 1898 and received his early education in local public schools. He attended Howard University in Washington, DC, and obtained the AB degree in 1920 and the MD degree in 1923. From 1924 until 1938, Dr. Williams had a highly successful private practice, which he left to begin his career in the Health Department. Before his assignment to the Druid Health Center, Dr. Williams attended the Harvard School of Public Health and was awarded the MPH degree in 1939.

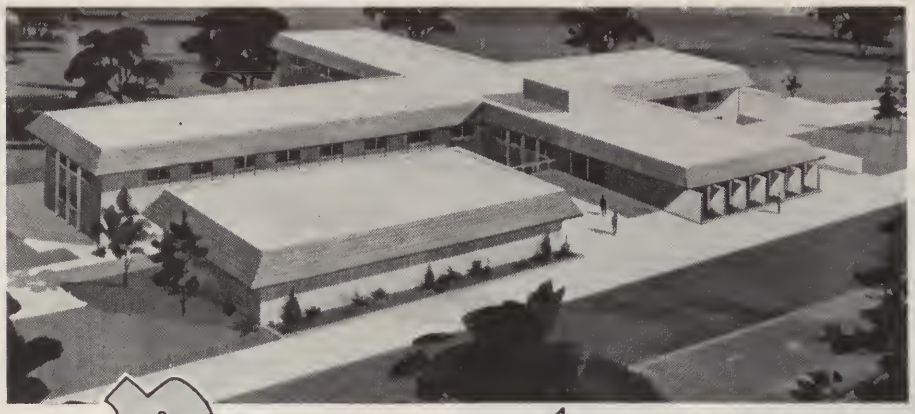
Dr. Williams has been a physician with the Baltimore Public Schools, a visiting lecturer at

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®
(desipramine hydrochloride)
non-sedating · rapid-acting
ANTIDEPRESSANT



helps restore normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) often reverses the signs and symptoms of depression including sleep disturbances feeling of sadness, guilt, anxiety, worthlessness and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

Morgan State College, Howard University, and the Provident Hospital School of Nursing. As a member of the Board of Directors of the Maryland Tuberculosis Association, he helped direct the attack on what has frequently been called Baltimore's most serious public health problem. Dr. Williams is also a member of the American Trudeau Association, the Monumental City Medical Society, the National Medical Society, and the American Public Health Association. He is the author of a number of articles dealing chiefly with public health administration.

Robert E. Farber, MD
Commissioner of Health

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

SUICIDE

Fifteen per cent of all suicides in 1964 were committed by people currently or previously under care in a psychiatric hospital or outpatient facility. The 59 suicides among the 50,702 adults who had been under treatment in these facilities between July 1, 1961, and June 30, 1964, were equal to a rate of 116.4 per 100,000, as compared with a rate of 15.4 for the remainder of Maryland's adult population. While these figures indicate that suicides were proportionally nearly eight times as frequent among present or former patients, they also show that only a small number of these deaths occurred among these individuals.

The Table, based on data from the Maryland Psychiatric Case Register, shows the distribution of these suicides by type and by the patient's latest reported diagnosis. Most had psychoneurotic or personality disorders, while only a few had a diagnosis of alcoholism.

Thirteen deaths occurred while the patient was hospitalized. Five of these resulted from jumping from a high place and represented a majority of the nine deaths of this type recorded in the state. Of the remainder, 19 (32.2%) occurred while on hospital leave or under clinic care, and 27 (45.8%) after discharge from treatment.

Suicide has been described as a cry for help. It is often a conscious or subconscious indication of an inability or unwillingness to face and resolve the problems we feel are confronting us. Louis I. Dublin, in his book *The Facts of Life*, estimated that one out of every 70 American males and one out of every 220 females would ultimately commit suicide. Further, although the number of unsuccessful suicides is not known, it is believed that there are at least 10 suicidal attempts for every successful suicide.

Suicide has merited close attention and interest, since attempts at self-destruction could often be prevented and are a negation of our basic cultural

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

ABBOTT

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

economy

Patients, in many cases, save enough to get five weeks of medication for the price of four, compared to other leading long-release anorectics.

601060

CONTRAINDICATION: Desoxyn and Desbutal are contraindicated in patients taking a monoamine oxidase inhibitor.

PRECAUTIONS: Use with caution in patients with hypertension, cardiovascular disease, hyperthyroidism, old age, or those sensitive to sympathomimetic drugs or ephedrine and its derivatives. Careful supervision is advisable with maladjusted individuals.

and religious beliefs. One concrete result has been the establishment in some cities of special centers staffed by psychiatrists and other trained personnel where the would-be suicide can find professional help in meeting the problems confronting him. A facility of this type is now being sought in Baltimore. The development of comprehensive community mental health centers, by providing closer and more immediate mental health services, can also be expected to reduce the magnitude of this problem.

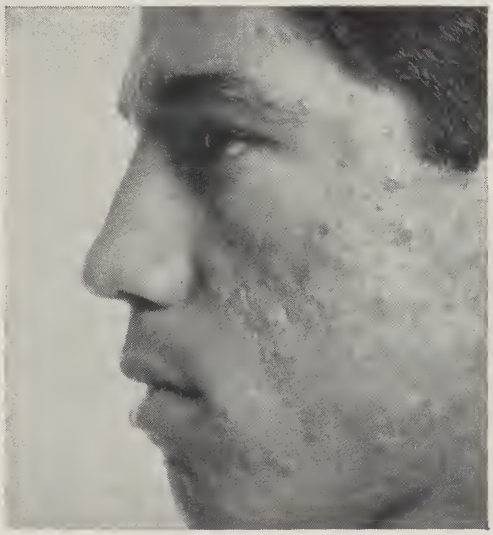
New
ow-cost tetracycline/antifungal therapy

for broad-spectrum activity
plus specific antifungal prophylaxis
at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

liabetic patients

2. nonpregnant women with a history of recent or recurrent monilial vaginitis



3. elderly or debilitated patients

patients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. No cases of photosensitivity have been reported with Tetrex (tetracycline phosphate complex). With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

Librarian

Next month the Semiannual Meeting will be held in Ocean City. As before, a collection of recent books will be displayed for you to look at and charge out. If you would like us to bring specific titles or subjects, please notify the librarian beforehand so that we can satisfy your requests.

During June, the Medical Library Association met in Boston. Mr. Alfred Brandon, director, Welch Medical Library, Johns Hopkins Medical School, presided. Current problems and progress pertinent to medical libraries were discussed, including the Medical Library Assistance Act of 1965. At least a dozen medical librarians from the Baltimore area, including your librarian, attended this convention.

At the Medical Society Libraries Group dinner meeting, Dr. William Gordon, surgeon and member of the Board of Trustees, Denver Medical Society, and Mr. C. Lincoln Williston, executive director, Texas Medical Association, spoke on the library-physician relationships in the medical societies and the advantage of society-operated libraries, including the possibilities for increasing their services.

BOOK NOTES

Intensive family therapy; theoretical and practical aspects, edited by Ivan Baszormenyi-Nagy, MD, and James L. Framo, PhD, New York: Hoeber, 1965. 507 pages.

Fifteen authorities contributed original chapters to this publication, which will serve as a guide for practitioners now working through conjoint treatment of the whole family. It presents viewpoints of the various schools of intensive family therapy. Each chapter includes a good bibliography pertinent to the subject.

Family therapy; a selected annotated bibliography, published by The National Clearinghouse for Mental Health Information, a branch of the Public Health Service, presents a good review of the subject. It is limited to publications in the English language which would be readily available. While not comprehensive, it attempts to give a broad range of current practices.

The heart; its functions in health and disease, by Arthur Selser. University of California Press, 1966.

Cardiovascular diseases and care of the cardiac patient are subjects of growing concern, due to the fact that 14.6 million adult Americans have some form of heart disease. This book fills a need for those who need something at a higher level than the popular type publication yet not as technical as the books written for the physician. It could be read profitably by the patient at his doctor's suggestion. It is number 1 in the series, *Perspectives in Medicine,* edited by Leo van der Reis, MD.

Bamadex® Sequels®

Contraindications: In hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised; especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of pre-existing symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dose—operation of motor vehicles, machinery or other activity requiring alertness should be avoided. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia, the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness, lethargy, stupor, ataxia, coma, shock, vasomotor, and respiratory collapse.

First aid for a button popper

Second aid for a button popper

Bamadex® Sequels®

d-amphetamine sulfate (15 mg.) and meprobamate (300 mg.)
Sustained Release Capsules

By providing combined anorexigenic-tranquilizing action, BAMADEX SEQUELS Capsules help your nonshrinking patients to establish new patterns of eating less. The amphetamine component suppresses the appetite, while the meprobamate helps allay nervousness and tension. And for most patients, the *sustained* release of the active ingredients makes possible convenient one-capsule-a-day dosage.

BALTIMORE NEWSWRITERS WIN 1965

Faculty President J. Morris Reese, MD (right), presented a check for $1,000 to Mrs. Joann Rodgers and Mr. Louis Linley, winners of the AMA's 1965 Medical Journalism Award for newspapers.

—Photo by the Baltimore News American

MEDICAL JOURNALISM AWARDS

A series of articles in The Baltimore News American, written with the cooperation of the Medical and Chirurgical Faculty, won two medical journalism awards for newspapers. The writers, Mrs. Joann Rodgers and Mr. Louis Linley, of the News American staff, were awarded $1,000 from the AMA and $2,500 from the Albert and Mary Lasker Foundation.

Entitled "Your Health and Medicine," the 15-part series surveyed man's major diseases and physical disorders. The articles gave the historical background as well as the most current knowledge about the major killing and crippling diseases. The series ran three times a week for five weeks, between October 10 and November 9, 1965. Each article started on the front page and was continued with a double-page spread inside.

The Medical and Chirurgical Faculty recommended an expert in each of the areas to be surveyed. The consultants assisted the writers by providing information in their specialty and by checking the written drafts for medical accuracy. The Faculty also helped in securing permission to reprint illustrations from various sources.

The AMA cited the newspaper series as "an outstanding example of journalism that contributes to a better public understanding of medicine and health in the United States." The judges for the Albert Lasker Medical Journalism Award considered it one of the most extraordinary series ever to appear in the public press.

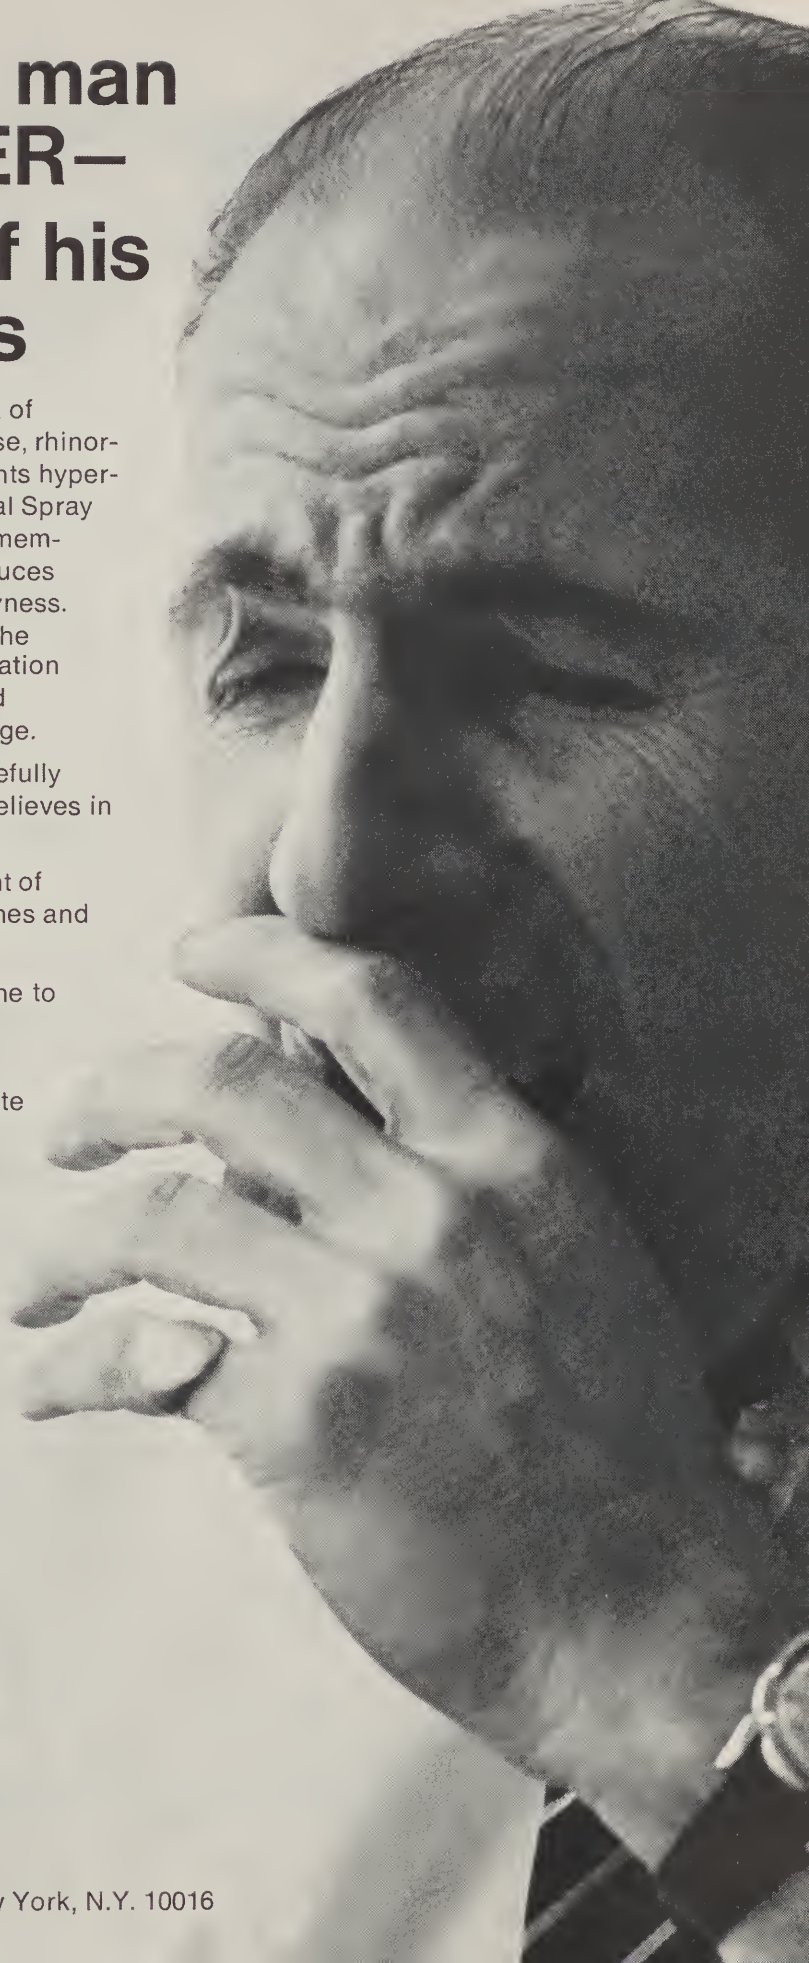
Once merely a man with HAY FEVER—



now a victim of his own antibodies

Whatever term describes him in this new era of immunology, the symptoms of congested nose, rhinorrhea and sneezing haven't changed in patients hypersensitive to pollens and molds. But NTZ® Nasal Spray relieves the symptoms. It decongests nasal membranes on contact, relieves itching and reduces excessive rhinorrhea without unpleasant dryness. The first spray of well-tolerated NTZ shrinks the turbinates, helps restore normal nasal ventilation and breathing. After a few minutes, a second spray enhances sinus ventilation and drainage.

More than a simple vasoconstrictor, the carefully balanced formula of effective components relieves in three ways with:

- **N**eo-Synephrine® HCl 0.5%, a decongestant of unexcelled efficacy to shrink nasal membranes and allow more comfortable breathing.
- **T**henfadil® HCl 0.1%, a topical antihistamine to help relieve itching and rhinorrhea.
- **Z**ephiran® Cl 1:5000, an excellent wetting agent and antiseptic preservative to promote the rapid spread of components to less accessible nasal areas.

Supplied in convenient pocket-size plastic spray bottle of 20 ml. Also available as a solution of 30 ml. (1 fl. oz.) with dropper, and 473 ml. (1 pint).

Prescribe

NTZ® Nasal Spray

(contains Neo-Synephrine HCl)

Star-spangled way to sweeten up your future

The old American proverb says, "money isn't everything, but it sure helps."

And that goes double for the money you put in U. S. Savings Bonds. Because this money helps two important ways.

First, it helps your future. Putting youngsters through college. Building homes and summer cottages. Buying cruises for you and the spouse. You dream it; Bonds can deliver it.

Second, it helps your country now, by making Uncle Sam a stronger influence in an unsettled world.

Your fellow Americans have tucked over 48 billion dollars into U. S. Savings Bonds. Why not join them? There's no safer investment anywhere in the world.

ALBERT E. GOLDSTEIN MEMORIAL FUND

Officers have been chosen for the Dr. Albert E. Goldstein Memorial Fund, which will honor the late physician and educator's many contributions to his profession and the community. The memorial is to perpetuate his personal and abiding interest in young men and women and particularly in the young physicians, whose lives he touched in every area of medical practice and interest.

Fund headquarters are Suite 912, Fidelity Building, Baltimore. Officers are: president, Louis J. Kolodner, MD; vice presidents, John C. Krantz, PhD, Albert A. Shuger, Leonard A. Siems; treasurer, Frank Fisher; secretary and assistant treasurer, Moses W. Rosenfeld.

A committee was formed after Dr. Goldstein's many friends spontaneously proposed the establishment of a memorial tribute. They cited his long and distinguished career at Sinai Hospital and Levindale, his leadership of the Medical and Chirurgical Faculty, and his life-long influence upon and contributions to his students and colleagues at the University of Maryland as a mark of his boundless energy and unlimited talents.

Members of the committee include the following: John Askin, MD, Louis Bachrach, MD, Louis Diener, MD, Robert B. Goldstein, MD, Milton Kirsh, MD, Irving R. Lowitz, MD, Nathan E. Needle, MD, Marvin S. Plant, H. Melvin Radman, MD, Martin A. Robbins, MD, Louis Sachs, MD, John Sargeant, Herman Seidel, MD, Milton Sherry, MD, Abraham Silver, MD, William H. Triplett, MD, Sheldon Wengel, and Israel S. Zinberg, MD.

Members of the Honorary Committee include: Robert vL. Campbell, MD, Fitzgerald Dunning, PhD, Albert Esterson, Hugh J. Jewett, MD, Honorable Theodore R. McKeldin, Joseph Meyerhoff, J. Morris Reese, MD, William W. Scott, MD, Arnold M. Seligman, MD, Rabbi Abraham Shusterman, William S. Stone, MD, Alfred Ullman, MD, Austin H. Wood, MD, and John D. Young, Jr., MD.

GLUCOLA™

Carbonated Preparation for
Carbohydrate Tolerance Tests

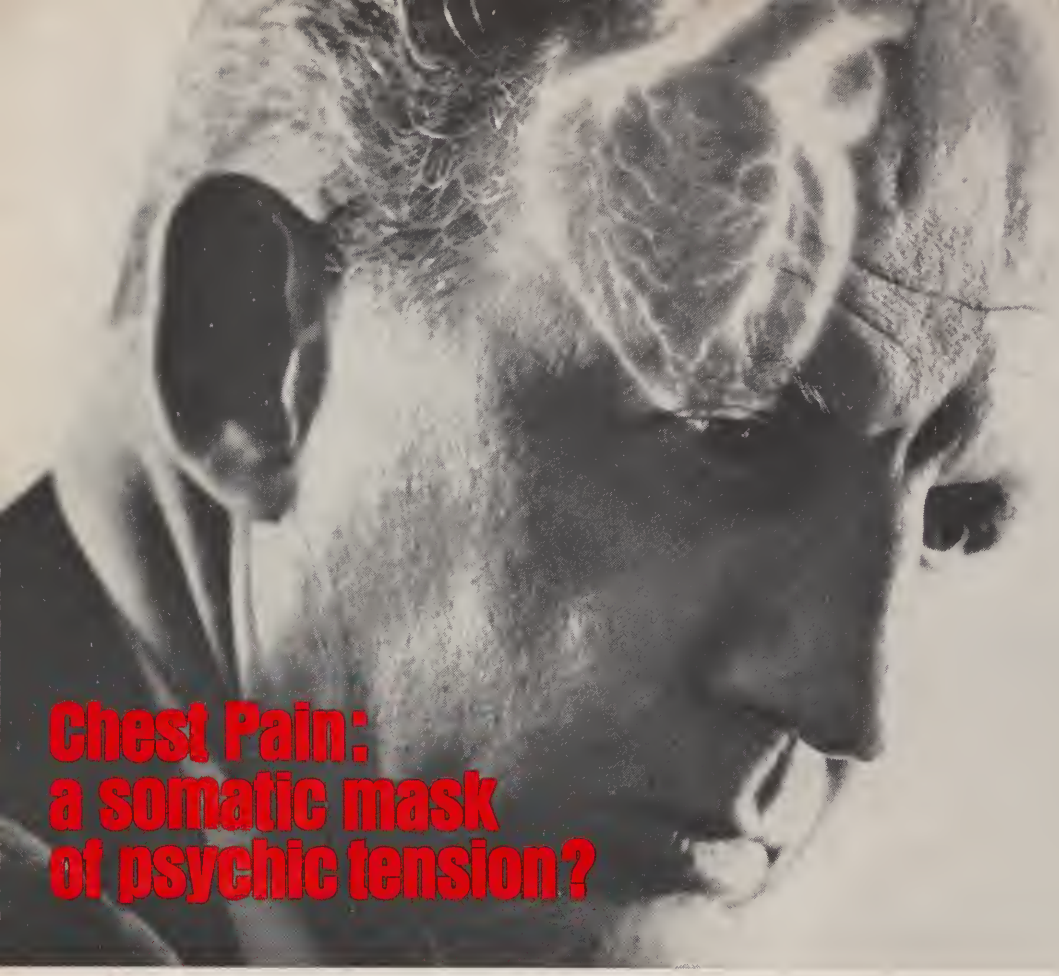
NEW

- **For use in glucose tolerance tests**
- **In preference to the postprandial test meal**

A NEW SOLUTION FOR AN OLD PROBLEM

Ready to use • Pleasant tasting cola flavor • Well tolerated

A 7-ounce bottle of GLUCOLA provides a liquid oral loading dose equivalent to 75 Gm. of glucose* for carbohydrate tolerance testing. GLUCOLA avoids the nausea that frequently results from lingering sweet laboratory preparations, and the occasional emesis that necessitates rescheduling the test. With GLUCOLA, no time is lost weighing and mixing glucose "cocktails"—only a bottle opener is needed.



753(R2)64

*The rapidly hydrolyzable saccharides in this formulation assure optimum absorption and glucose levels comparable to those obtained with a 100 Gm. loading dose.

Available through your regular supplier:
cartons of 12 7-oz bottles (6 bottles per pack, 2 packs per carton).

AMES

Chest Pain: a somatic mask of psychic tension?

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

NEUROTIC FATIGUE—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be alleviated by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage — Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

• *antihistaminic action* relieves sneezing, nasal congestion, pruritus, and lacrimation
• *antispasmodic action* alleviates bronchial and gastrointestinal spasm.

Precautions: Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with BENADRYL should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENADRYL.
Side Effects: Side reactions, commonly associated with antihistaminic therapy and generally mild, may affect the nervous, gastrointestinal, and cardiovascular systems. Most frequent reactions are drowsiness, dizziness, dryness of the mouth, nausea, and nervousness. BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg.

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

FOR SYPHILIS AND OTHER TREPONEMATOSES

HYNSON, WESTCOTT & DUNNING, INC.

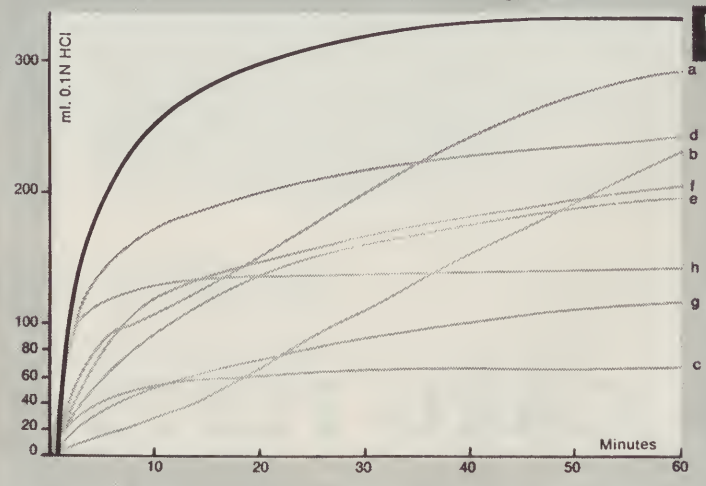
Baltimore, Maryland 21201 HW&D

Winthrop announces new WinGel®

ANTACID TABLETS AND LIQUID

For peptic ulcer, gastric hyperacidity, gastritis

Each WinGel tablet or teaspoon (5 ml.) contains 410 mg. of combined, highly reactive, short polymer, aluminum and magnesium hydroxides **stabilized with hexitol.**



Neutralizes 300 times its active-ingredient weight in gastric acid for fast, long-lasting relief

Gastric or duodenal ulcer, acute or chronic gastritis, gastric hyperacidity...wherever there is "acid overflow" new WinGel can provide faster, longer, more complete neutralization.

In recent laboratory comparisons* with eight other leading antacids, new WinGel tablets not only neutralized more hydrochloric acid per active-ingredient weight, but neutralized it faster and longer than all other antacids tested.

Pleasant pink in color, WinGel is delicately mint flavored with a smooth-as-cream texture—qualities sure to please the patient on long-term therapy. New WinGel is also specially formulated to avoid constipation or diarrhea.

New WinGel neutralizes 300 times its active-ingredient weight in 0.1N hydrochloric acid—neutralizes more acid faster than other leading antacids

Rate of 0.1N hydrochloric acid neutralization at pH 3.5 and 37° with WInGel and eight other leading antacid tablets—*in vitro*. Samples equaled the weight of tablet material containing 1.0 Gm. active ingredients.*

*Hinkel, E. T., Jr. (New York): Data in the files of the Department of Medical Research, Winthrop Laboratories.

Dosage: Peptic ulcer or gastritis—from 2 to 4 teaspoons of WinGel liquid or 2 to 4 tablets chewed or allowed to dissolve in the mouth every two to four hours. **Gastric hyperacidity**—2 tablets or teaspoons about ½ to one hour after meals as needed; children from 7 to 14 years of age, 1 or 2 tablets or 1 or 2 teaspoons of liquid as needed.

How Supplied: Liquid in bottles of 8 fl. oz. and 1 pint. **Tablets** in cellophane strips, boxes of 50 and 100. (One teaspoon of WinGel liquid is equivalent to one WinGel tablet in acid-combining capacity.) WinGel, trademark reg. U.S. Pat. Off.

Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Breast-feeding and the "modern mother"

Despite a mild resurgence of interest in the importance of breast-feeding a few years ago, many women today do not choose to nurse their young. This is for a variety of reasons—social, economic, cultural and sometimes medical. In such cases the physician's task is to find the most suitable means of preventing lactation and easing the pain of breast engorgement.

The means of therapy

The value of hormone therapy for this indication is of course well established. Both androgen and estrogen are known to inhibit the production and secretion of the lactogenic hormone by the anterior pituitary. As estrogen levels decline sharply at parturition, lactogenesis is established. When androgen and estrogen are administered to the patient before the release of the lactogenic hormone lactation and breast engorgement are usually prevented.

The time of therapy

The time of administration of this combined medication is crucial; it must be given early enough to suppress the pituitary prolactin and last long enough to permit physiologic readjustment during the puerperium. Excellent results are most often seen when therapy is administered before the onset of the second stage of labor.

However, factors other than effectiveness must also be considered. The agent selected should not interfere in any way with parturition, subsequent uterine involution and the restoration of normal ovarian cyclic function. Furthermore, it should not cause rebound breast engorgement or other manifestations of hormonal imbalance.

A balanced formulation

Providing single-dose therapy for the prevention of lactation and breast engorgement, Deladumone OB is a potent androgen-estrogen combination with a prolonged action. The optimal balance of androgenic and estrogenic hormones achieved in this preparation minimizes the disadvantages inherent in single hormone therapy, such as rebound breast engorgement. Involution of the uterus and resumption of menstrual cycles are not affected.

As reported in a recent published study (Roser, D. M.: Obstet. & Gynec. *27*:73, 1966), Deladumone OB provided good suppression of breast engorgement in 95.3% and suppression of lactation in 81.1% of 86 obstetrical patients. These results are in general agreement with those of many earlier investigations; in several studies this injectable androgen-estrogen combination proved to be superior to oral medication.

Dosage:

As a single injection of 2 cc. before the onset of the second stage of labor.

Contraindications:

Established or suspected mammary cancer or genital malignancy.

Precautions and Side Effects:

Certain patients may be unusually responsive to either estrogenic or androgenic therapy. In such individuals virilization, uterine bleeding or mastodynia may occur.

Supply:

Deladumone OB, providing 180 mg. testosterone enanthate and 8 mg. estradiol valerate per cc., is available in 2 cc. Unimatic® disposable syringes and in 2 cc. vials. Both preparations are dissolved in sesame oil, with 2% benzyl alcohol as a preservative. *Before use, consult product literature for full prescribing information.*

Deladumone® OB

Squibb Testosterone Enanthate (180 mg./cc.) and Estradiol Valerate (8 mg./cc.)

Single-dose injection for lactation inhibition

William J. Peeples, MD, Commissioner of Health, State of Maryland Department of Health.

MARYLAND PSYCHIATRIC SOCIETY

October 13

"Brief Hospitalization"

Duncan McMillan, MD, superintendent, Mapperly Hospital, Nottingham, England.

PATHOLOGY SECTION, BCMS

October 17

1. Slide seminar moderated by **William Hartmann, MD**, Surgical Pathology Department, The Johns Hopkins Hospital.
2. "Amyloid Producing Tumors of the Thyroid," **William Hartmann, MD**

ARTHRITIS SYMPOSIUM

LAKE WRIGHT MOTOR HOTEL

October 7-8

sponsored by:

Tidewater Branch, the Arthritis Foundation

and the

Norfolk County Medical Society

For further information, write to the Arthritis Foundation, Tidewater Branch, 809 Brandon Ave, Room 306, Norfolk, Va 23517.

OBSTETRICS AND GYNECOLOGY COURSE

sponsored by

The Academy of Medicine of New Jersey

November 16-19

St. Barnabas Medical Center, Livingston, NJ

The course, presented in cooperation with the New Jersey Obstetrical and Gynecological Society and the New Jersey State Department of Health, will cover all aspects of obstetrics and gynecology from the juvenile to the geriatric patient. An outstanding faculty has been gathered for the three and one-half days.

Tuition will be $20 a day or $50 (including lunches and parking) for the entire three and one-half days. Arrangements will be made for overnight accommodations in a nearby motel.

AAGP credit has been applied for.

Further information can be obtained from James Breen, MD, chairman, Section on Obstetrics & Gynecology, The Academy of Medicine of New Jersey, 317 Belleville Avenue, Bloomfield, NJ 07003.

THIRD NATIONAL CONGRESS ON MEDICAL QUACKERY

sponsored by the American Medical Association and the National Health Council

October 7-8

PICK-CONGRESS HOTEL, CHICAGO

For program and registration form, write to John G. Thomsen, MD, chairman, Committee on Quackery, American Medical Assaciation, 535 N Dearborn St, Chicago, Ill 60610.

AMERICAN COLLEGE OF PHYSICIANS

Regional Meeting for Maryland and District of Columbia Internists

October 15

Auditorium of the District of Columbia Medical Society Headquarters Building, Washington, DC

For further information write to: Thomas W. Mattingly, MD, Washington Hospital Center, 110 Irving Street, NW, Washington, DC.

FELLOWSHIP TRAINING PROGRAMS

1. Comprehensive (Psychosomatic) Medicine for the Internist or General Practitioner.

Applications are being accepted for training in comprehensive (psychosomatic) medicine in the Departments of Medicine and Psychiatry at the Sinai Hospital of Baltimore, a 500-bed community general hospital, clasely affiliated with the Johns Hopkins Hospital and School of Medicine. The training program is based on a 34-bed medical ward service with clinical responsibility and close supervision by staff psychiatrists and internists. Training stipends paying $12,000 a year are available through the USPHS. Inquiries should be directed to Bernard P. Shochet, MD, Liaison Service, Sinai Hospital of Baltimore, Belvedere and Greenspring Avenues, Baltimore, 21215.

2. Psychiatry as it Applies to General Medical and Pediatric Practice.

A postgraduate training program for internists, general practitioners, and pediatricians has been developed at the University of Maryland School of Medicine. Trainees can spend fulltime for six months to a year in intensive training in the comprehensive clinical diagnosis, psychological evaluation and psychotherapy of medical or pediatric patients. Stipends are available which pay up to $12,000 a year.

For further information write to Virginia Huffer, MD, Department of Psychiatry, University of Maryland School of Medicine Baltimore, Md 21201.

MEDIC

1966-1967 SCHEDULE OF POSTGRADUATE PROGRAMS
presented through
Medical Education's Dedicated Instructional Channel

☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆ ☆

MEDIC is a telephone network which joins the cooperating parties for the purpose of postgraduate education. It is hoped that by this means the listening audience for scientific programs now being presented in Maryland may be enlarged. It is provided through the cooperative efforts of:

- **The Medical and Chirurgical Faculty of the State of Maryland**
- **The Maryland State Department of Health**
- **The Hospital Council of Maryland, Inc.**
- **Participating hospitals.**

☆ ☆ ☆

APPROPRIATE CREDIT WILL BE GIVEN BY THE AMERICAN ACADEMY OF GENERAL PRACTICE FOR ATTENDANCE AT MEDIC LECTURES.

Programs are presented on Friday unless otherwise indicated.

PROGRAM LISTINGS WILL APPEAR MONTHLY IN THE MARYLAND STATE MEDICAL JOURNAL.

PROGRAMS

SEPTEMBER 30—12:30 PM

Treatment of the Unconscious Alcoholic: Immediate and Long Term

Julius R. Krevans, MD, Associate Professor of Medicine, The Johns Hopkins Hospital, and Head of Department of Medicine, Baltimore City Hospitals
and
Isadore Tuerk, MD, Commissioner, State Department of Mental Hygiene.

Sponsor: Subcommittee on Alcoholism: Medical and Chirurgical Faculty

OCTOBER 7—12:30 PM

Refractory Shock

Arlie R. Mansberger, Jr., MD, Associate Professor of Surgery, University of Maryland School of Medicine.

Sponsor: University Hospital

OCTOBER 14—12:30 PM

Backache

Martin L. Singewald, MD, Assistant Professor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

OCTOBER 21—12:30 PM

Selection of Patients for Cardiac Surgery

R Adams Cowley, MD, Professor and Head, Division of Thoracic Surgery, University of Maryland School of Medicine.

Sponsor: Peninsula General Hospital

OCTOBER 28—1 PM

Hypoglycemia

David Rabinowitz, MRCP, Assistant Professor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: Frederick Memorial Hospital

NOVEMBER 4—12:30 PM

Organic Versus Functional Psychoses: Differential Diagnosis

Virginia Huffer, MD, Associate Professor of Psychiatry, University of Maryland School of Medicine
and
Lindbergh S. Sata, MD, Assistant Professor of Psychiatry, University of Maryland School of Medicine.

Sponsor: University Hospital

NOVEMBER 11—12:30 PM

Pediatric Surgical Emergencies

J. Alex Haller, Jr., MD, Associate Professor of Surgery, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

NOVEMBER 18—12:30 PM

Practical Dermatologic Diagnosis

Thomas W. Cooper, MD, Hagerstown.

Sponsor: Washington County Hospital

NOVEMBER 25—1 PM

Intersex Problems

Milton S. Grossman, MD, Assistant Professor of Pediatrics, University of Maryland School of Medicine.

Sponsor: Frederick Memorial Hospital

DECEMBER 2—12:30 PM

Treatment of the Female Climacteric

Arthur L. Haskins, MD, Professor and Head of the Department of Obstetrics and Gynecology, University of Maryland School of Medicine.

Sponsor: University Hospital

DECEMBER 9—12:30 PM

Peptic Ulcer

Theodore M. Bayless, MD, Instructor of Medicine, The Johns Hopkins University School of Medicine
and
Walter F. Ballinger, II, MD, Associate Professor of Surgery, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

DECEMBER 16—12:30 PM

Kidney Disease

Warren P. Gruppee, MD, Babies and Children's Hospital, Cleveland.

Sponsor: Cumberland Memorial Hospital

JANUARY 6—12:30 PM

Use of Drugs and Alcohol and Their Relation to Automobile Accidents

Russell S. Fisher, MD, Professor of Forensic Pathology, University of Maryland School of Medicine.
and
Henry C. Freimuth, MD, Associate Professor of Forensic Pathology, University of Maryland School of Medicine.

Sponsor: University Hospital

JANUARY 13—12:30 PM

Arteriosclerosis and Diet

Benjamin M. Baker, MD, Professor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

JANUARY 20—12:30 PM

Organ Scans

William A. Newman, MD, and **Albert P. Marsh, MD,** Radiology Department, Sacred Heart Hospital.

Sponsor: Sacred Heart Hospital

JANUARY 27—1 PM

Differential Diagnosis of Growth Retardation and Sexual Infantilism in Adolescence

Robert M. Blizzard, MD, Associate Professor of Pediatrics, The Johns Hopkins University School of Medicine.

Sponsor: Frederick Memorial Hospital

FEBRUARY 3—12:30 PM

Mental Retardation, Pseudo-Retardation and School Failure

Raymond L. Clemmens, MD, Associate Professor of Pediatrics, University of Maryland School of Medicine.

Sponsor: University Hospital

FEBRUARY 10—12:30 PM

Acute Head Injuries

Perry Black, MD, Instructor of Neurosurgery, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

FEBRUARY 17—12:30 PM

Clinical Studies of Diabetes

Thaddeus E. Prout, MD, Chief, Department of Medicine, Greater Baltimore Medical Center.

Sponsor: Greater Baltimore Medical Center

FEBRUARY 24—1 PM

Pineal Gland

Richard J. Wurtman, MD, National Institutes of Health, Bethesda.

Sponsor: Frederick Memorial Hospital

MARCH 3—12:30 PM

Anesthesiology-Respiratory Problems of the Asthmatic

Martin I. Gold, MD, Associate Professor of Anesthesiology, University of Maryland School of Medicine.

Sponsor: University Hospital

MARCH 10—12:30 PM

Hypersusceptibility to Infection: Evaluation and Management

F. Robert Fekety, Jr., MD, Assistant Professor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

MARCH 17—12:30 PM

The Use of Physical Medical Techniques in the Management of Arthritis

B. Stanley Cohen, MD, Head, Department of Physical Medicine and Rehabilitation, Sinai Hospital of Baltimore.

Sponsor: Sinai Hospital

MARCH 24—1 PM

Parathyroid Disease

Commander Jonas Sode, MC, Medical Service, U. S. Naval Hospital, Bethesda.

Sponsor: Frederick Memorial Hospital

MARCH 31—12:30 PM

The Effective Use of a Pathology Service

Thomas M. Peery, MD, Professor of Pathology and Director of Laboratory Service, George Washington University Medical School.

Sponsor: Anne Arundel General Hospital

APRIL 7—12:30 PM

Open Heart Surgery—Preoperative Evaluation of Patients With Acquired Heart Disease

R Adams Cowley, MD, Professor and Head, Division of Thoracic Surgery, University of Maryland School of Medicine.

Sponsor: University Hospital

APRIL 14—12:30 PM

Population Dynamics

Paul A. Harper, MD, Professor of Maternal and Child Health and Population Dynamics, The Johns Hopkins University School of Hygiene.

Sponsor: The Johns Hopkins Hospital

APRIL 21—12:30 PM

Population Control

Hugh J. Davis, MD, Assistant Professor of Gynecology and Obstetrics, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

APRIL 28—1 PM

Concepts in Treatment of Adrenocortical Dysfunction

Col. William Beisel, MC, Walter Reed Unit, Fort Detrick Army Hospital.

Sponsor: Frederick Memorial Hospital

MAY 5—12:30 PM

Use and Abuse of Psychotropic Agents

Gerald D. Klee, MD, Associate Professor of Psychiatry, University of Maryland School of Medicine
and
Walter Weintraub, MD, Associate Professor of Psychiatry and Director of Inpatient Service, University of Maryland School of Medicine and Hospital.

Sponsor: University Hospital

MAY 12—12:30 PM

Chemotherapy of Malignancy

Albert H. Owens, Jr., MD, Associate Professor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: The Johns Hopkins Hospital

MAY 19—12:30 PM

Hypogonadism

Saul W. Rosen, MD, USPHS, National Institutes of Health, Bethesda.

Sponsor: Prince George's General Hospital

MAY 26—1 PM

Treatment of Thyrotoxicosis

J. Elliot Levi, MD, Instructor of Medicine, The Johns Hopkins University School of Medicine.

Sponsor: Frederick Memorial Hospital

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets

In Granules for Oral Suspension

ERYTHROCIN®-SULFAS

Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

If you can hang on for a few minutes, Doctor,
I'm sure I'll start coughing again.

Some patients don't realize there's more to a cough than meets the ear.
If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex And the fresh, grape flavor of Novahistine DH appeals to children and adults alike.
When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial constriction and obstruction.
Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.
Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

NOVAHISTINE® EXPECTORANT

DOW **PITMAN-MOORE** Division of The Dow Chemical Company, Indianapolis

The "Socio-geographic" mystery

Why is one man's gastric ulcer another man's duodenal?

Geographic variation in the *incidence* of peptic ulcer is a familiar fact. But the proclivity of certain *kinds* of ulcer for certain geographic areas is a recently recognized phenomenon.[1,2]

For example, in one particular Norwegian fishing village there is a tendency for patients to develop a gastric ulcer; anywhere else in Norway, ulcers are usually duodenal. Peruvians high in the Andes have more gastric ulcers than their compatriots in the lowlands. Why? Nobody knows.

Social variations, too. Even in the same geographic areas there are interesting variations. An Englishman's ulcer depends on his social standing—professional men suffer with duodenal ulcers, while workingmen have more of the gastric variety. In southern India the pattern is reversed. Here, duodenal ulcers are common among laborers and agricultural workers and rare among the upper classes.

Investigators are exploring every possible theoretical avenue in their search for the cause of peptic ulcer. Of all the factors implicated in ulcerogenesis, the one that is generally acknowledged to be of primary importance is hypersecretion of gastric acid.[3-8] Or, as one author states it: "The medical management of peptic ulcer pharmacologically is, in the final analysis, concerned largely with the effective inhibition of peptic activity."[3]

Robinul (glycopyrrolate) provides potent, rapid, specific antisecretory action confirmed by gastric analyses and x-ray evidence of clinical effectiveness.[3,7,9-12] Relieves pain with "impressive" promptness.[8] Quickly alleviates acute discomfort, and effectively counteracts gnawing pain, preprandial midepigastric pain, belching and other ulcer symptoms.[7] Suppression of nocturnal pain is "outstanding."[13] Maximally effective doses may be given with minimal side reactions, and the incidence of unwanted anticholinergic effects is negligible.[3,7-14]

no matter what the ulcer theory... the fact is that

Robinul®
(glycopyrrolate)
promotes the essential ulcer-healing environment

A·H·ROBINS

(brief summary follows)

R10A66

Robinul®
(glycopyrrolate)

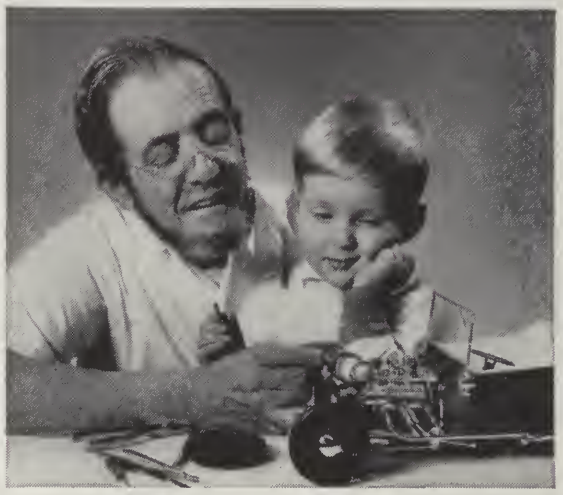
promotes the essential ulcer-healing environment

Indications: In addition to its primary indications for duodenal and gastric ulcer, Robinul (glycopyrrolate) is indicated for other GI conditions that may benefit from anticholinergic therapy. Robinul-PH Forte (glycopyrrolate 2 mg. with phenobarbital) is indicated when these situations are complicated by mild anxiety and tension.

Contraindications: Glaucoma, urinary bladder neck obstruction, pyloric obstruction, stenosis with significant gastric retention, prostatic hypertrophy, duodenal obstruction, cardiospasm (megaesophagus), and achalasia of the esophagus, and in the case of Robinul-PH Forte, sensitivity to phenobarbital.

Precautions: Administer with caution in the presence of incipient glaucoma.

Adverse Reactions: Dryness of the mouth, blurred vision, urinary difficulties, and constipation are rarely troublesome and may generally be controlled by reduction of dosage. Other side effects associated with the use of anticholinergic drugs include tachycardia, palpitation, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, drowsiness, and rash.



Dosage: Dosage should be adjusted according to individual patient response. Average and maximum recommended dose is 1 tablet 3 times a day: in the a.m., early p.m., and at bedtime. *See product literature for full prescribing information.*

Supply: Robinul (glycopyrrolate 1 mg.); Robinul Forte (glycopyrrolate 2 mg.); Robinul-PH (glycopyrrolate 1 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming); Robinul-PH Forte (glycopyrrolate 2 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming.) In bottles of 100 and 500 scored tablets.

Right there where he's needed

...due to LEPTINOL®

Improvement of mental alertness and awareness in the management of the senility syndrome requires a comforting environment, a stimulating dietary regimen and concomitant drug therapy. LEPTINOL® is a non-addictive stimulant which is a useful adjunct in elevating the mood of the elderly patient who displays apathy, mental confusion or memory lapses.

LEPTINOL® is a combination of pentylenetetrazol, niacin, thiamin and ascorbic acid which acts as a central nervous stimulant and which exerts its primary effect on the mid-brain and the medullary center. LEPTINOL® may be prescribed for patients with mild hypertension or other organic diseases.

Each LEPTINOL® bi-layer tablet contains: PENTYLENETETRAZOL, 100 mg., NIACIN, 50 mg., THIAMINE HYDROCHLORIDE, 1 mg., ASCORBIC ACID, 20 mg. DOSE one or two tablets, 3 times daily.

Side Effects: overdosage may produce tremor, convulsions or respiratory paralysis.

Caution should be taken when treating patients with a low convulsive threshold. Patients should be warned not to exceed recommended dose which offers maximum effectiveness.

Write for detailed literature and starter LEPTINOL® doses.

Your MEDICAL FACULTY at Work

JOHN SARGEANT EXECUTIVE SECRETARY

Executive Committee, July 21

1. Information was received that the University of Maryland School of Medicine is conducting a survey to ascertain what general medical facilities are needed for the care of stroke patients.

2. Information was received that the Aetna Insurance Company will reverse its earlier policy and will make payments to hospitals for professional services rendered and billed through this medium.

3. Information was received that a representative from the U.S. Senate Subcommittee on Monopoly and Antitrust is seeking information on physicians who are "fronting" for lay laboratories, and those who have arrangements whereby they may profit from the services of these laboratories.

4. Legal counsel has advised that it is legal for a physician to accept a promissory note from a patient and give the patient a receipted bill in order for him to collect from the Medicare fiscal intermediary. Such promissory note should be included as a cash receipt for income tax purposes.

5. Authorization was granted for the payment of the expenses of the Faculty's arbitrators in the Crisfield Hospital dispute.

6. The Executive Secretary was authorized to make contacts in connection with selecting a *Journal* editor for recommendation to Council.

7. The Faculty will notify the Social Action Committee, Maryland Chapter, National Association of Social Workers, of its interest in and willingness to assist with activities pertaining to medical matters.

8. A communication was received from the Erie County, NY, Medical Society suggesting that contact be made with congressmen with recommendations for amending the law pertaining to Title XIX programs. No action is to be taken.

9. A letter is to be sent to the State Board of Health and Mental Hygiene and the State Department of Health, Education and Welfare expressing concern over the development of a Title XIX program in Maryland without consultation with the Advisory Council on Medical Care or the Faculty.

EXECUTIVE SECRETARY'S NEWSLETTER

September, 1966

TRAFFIC SAFETY SEMINAR

Reminder: All-day Seminar on the Medical Aspects of Traffic Safety is scheduled for **Wednesday, October 12, 1966.** Programs are being sent to all members. Send your reservation in early.

MEDICAL ETHICS PROGRAM

An all-day session on Medical Ethics has also been scheduled for **Saturday, October 15,** at the Med-Chi Building. Primarily aimed at residents and interns who obtain very little of this during their student days, the sessions are open to all members.

Topics will range from "The Ethical, Legal and Moral Responsibilities" of physicians to a panel which will discuss "On Entering Practice."

More details to all members shortly.

DISPOSABLE HYPODERMIC NEEDLES

Complaints are being received in the Faculty office that some children are obtaining disposable hypodermic syringes from the trash receptacles which physicians have placed out for collection.

Physicians are urged to effectively destroy such syringes before placing them in the refuse so they may cause no harm through being an "attractive nuisance."

DRUG SAMPLES

Physicians are also advised to dispose of surplus drug samples by flushing them down the drain; or arranging for their pickup through the Woman's Auxiliary representative in their area. The Auxiliary has a project where surplus drugs are collected for eventual shipment to South Viet Nam and other areas throughout the world.

NEWS NOTES

Jacob H. Conn, M.D., has been elected North American Vice President in the Section of Clinical Hypnosis of the Pan American Medical Association.

New Fellows of the American College of Physicians include Samuel P. Scalia, Robert B. Rutherford, F. Fred Ruzicka, Sr., and Adam F. Szczypinski, all of Baltimore.

NEWS NOTES (cont'd)

Newly elected officers of the Maryland Tuberculosis Association are: William K. C. Morgan, President; David Marine, Vice-President; C. Murray Wylie, Secretary-Treasurer; Mary Ellen Avery and Milton B. Kress, both to the Executive Committee; and John E. Miller, local Councilor.

The Maryland Association of Private Practicing Psychiatrists include as officers: Theodore M. Feldberg, President; Michael J. Bisco, Vice-President; R. Taylor King, Secretary-Treasurer; and John G. Brickner and Dr. Feldberg as Counselors to the Maryland Psychiatric Society.

SCHOLARSHIPS IN MEDICINE

Ten State Senatorial Scholarships at the University of Maryland Medical School have been awarded to Maryland residents, the first since the recommendation of the Governor's Commission to Study the Shortage of GP's was adopted by the 1965 General Assembly.

One condition to the award is that the recipient must agree to serve for three years as a general practitioner in an area of medical need in this state.

DRUG ADDICTION REPORT AVAILABLE

The Maryland Commission to Study Problems of Drug Addiction's interim report includes a summarization of the drug abuse problem, Maryland's drug laws and a series of recommendations for a program to combat drug abuse. This report is available by request from Mr. Gerald Siegel, Chairman, Maryland Commission to Study Problems of Drug Addiction, Room 608, State Office Building, 301 W. Preston St., Baltimore, Maryland 21201.

PERSONALITIES

William H. Mosberg, Jr., M.D., Baltimore, has been designated as an official representative of the AMA to the All-Indian Medical Conference to be held in Dhanbad (Bihar), December 28 - 30, 1966.

John Sargeant

Executive Secretary

Why do so many DOCTORS choose MERCANTILE-SAFE?

Many physicians make Mercantile-Safe Deposit their bank, because we offer full-range bank and trust services . . . because we offer *personal* services that save busy doctors time, trouble and worry in handling their financial affairs. Here are just a few of our many services that are of particular value to doctors:

- **MERCANTILE-MEDAC** a fully-automated record keeping and billing system for doctors.
- **PRESTIGE CHECKING ACCOUNTS** with computer accuracy and speed of processing.
- **ESTATE PLANNING** to assure heirs the fullest benefits from estates.
- **AGENCY ACCOUNTS** to save time and worry in handling of investments.
- **EXECUTOR and TRUSTEE** of estates . . . and services of the State's largest Trust Division.

MAKE MERCANTILE-SAFE YOUR BANK!

MERCANTILE-SAFE DEPOSIT and Trust Company

Chartered 1864

Banking Locations: CALVERT & REDWOOD STREETS
CHARLES & CHASE STREETS · TOWSON BANK & DRIVE-IN
TIMONIUM BANK & DRIVE-IN · COCKEYSVILLE-SHAWAN
Trust Division: 13 SOUTH STREET

To Serve You Better

The MURRAY-BAUMGARTNER, Surgical Instrument Company moved the week of September 5th into spacious, expanded quarters especially designed for your convenience and for the most efficient service.

We thank you—our customers—for our continued success since 1920 and we invite you to visit us in our beautiful new building. You'll find it easy to reach, away from downtown congestion, and perfectly planned and constructed to continue and improve our merchandise displays, and our service to you.

Just minutes away from downtown, our new building is on Gwynns Falls Parkway, opposite Mondawmin Shopping Center—on or near principal thoroughfares in every direction—plenty of Free Parking.

MARYLAND'S HOUSE OF SERVICE

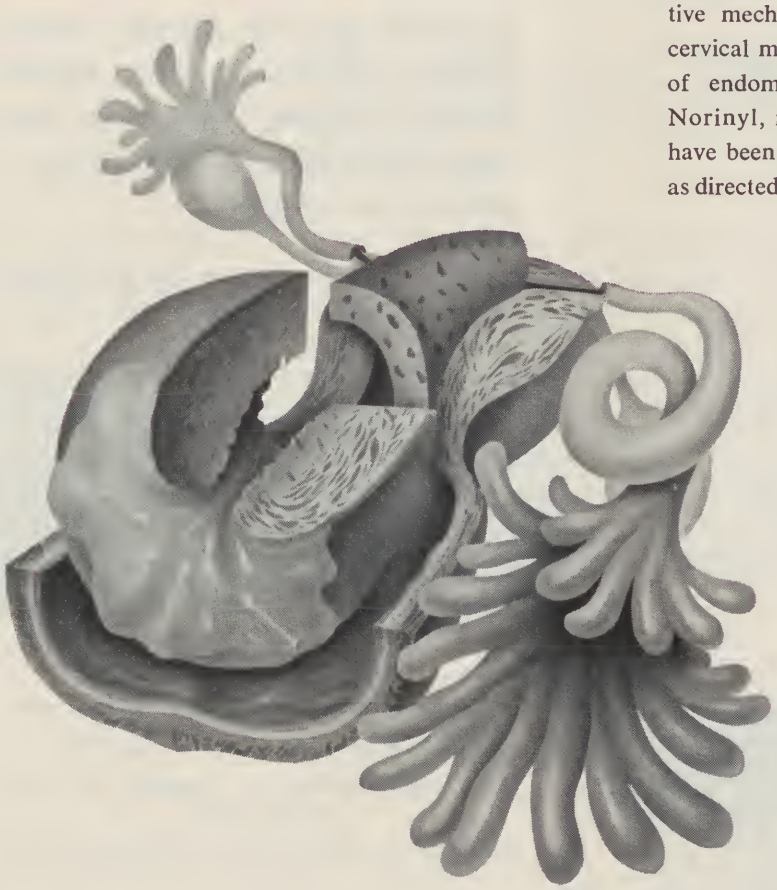
Serving the Medical Profession for Almost Half a Century



Norinyl® tablets
(norethindrone 2 mg. c mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.

plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

norethindrone—an original steroid from
SYNTEX
LABORATORIES INC., PALO ALTO, CALIF.

Norinyl® tablets
(norethindrone 2 mg ĉ mestranol 0.1 mg)
for multiple contraceptive action

good reason to select Ilosone®

Erythromycin Estolate

for bacterial infections

two to four times the therapeutic activity of other erythromycins

CONTRAINDICATIONS: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

SIDE-EFFECTS: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

DOSAGE: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Additional information available to physicians upon request.

Surgical Considerations in Gastrointestinal Bleeding

KARL F. MECH, MD
Assistant Professor of Surgery, University of Maryland School of Medicine; Chairman, Department of Surgery, St. Agnes Hospital

A myriad of conditions can cause major or minor bleeding from the gastrointestinal tract. Some are extremely serious, others relatively unimportant. Investigation of the patient's blood coagulating mechanism, proper diagnosis of site and cause of bleeding, and blood replacement before operation are of major importance. Good liaison between surgeon and medical man will pay dividends in many cases.

Appropriate surgery at opportune times will be indicated and often be lifesaving. The surgery for any particular portion of the gastrointestinal tract should be available whenever this condition exists. With good management, an acceptable surgical risk patient can be assured of good prognosis even in the face of life endangering bleeding. A plea is made for decision to operate before the blood is exhausted, patient debilitated, or other complications intervene. Choice of surgical procedure is discussed, and certain of these are recommended for specific conditions.

This presentation is in no way intended as a surgical discourse or treatise, but as an opportunity for me as a surgeon and you in the many branches of medicine to quietly discuss some matters of common interest. I feel no hesitation in taking up your time at this meeting to discuss this commonplace subject because of its frequency and importance and because it can be so elusive of diagnosis and so difficult to manage.

At the outset, I would like to state that no distinction can be made between "medical" or "surgical" gastrointestinal tract bleeding, and hospital admissions are properly made on either service. I hope to point out the value in many instances of joint management or at least consultative care by both medical man and surgeon.

I shall not argue the semantics of bleeding versus hemorrhage. The dramatic occurrence of the vomiting of blood or of the grossly bloody

Presented April 30, 1966, at the Bermuda Cruise Convention of the Medical and Chirurgical Faculty of the State of Maryland.

stool or tarry stool demands immediate attention. On the other hand, it must be conceded that often the microscopic or chemically detected melena may be even more important in early diagnosis and treatment of a still operable and curable malignancy, such as an ampullary carcinoma or a nonobstructive tumor of the bowel. Unexplained anemia may be the only clinical evidence of a carcinoma of the cecum, and proper investigation of this slow bleeding may lead to the important diagnosis.

The discovery of gastrointestinal tract bleeding does not necessarily dictate surgical intervention. Proper evaluation of the condition by the therapy team may indicate the wisdom of careful nonoperative management or early or delayed surgery. Much can be gained by adding the diagnostic acumen and treatment regimen of the medical therapist to that of the surgeon.

Diagnosis is of prime importance. The frustration and chagrin of the surgeon who conducts a surgical exploration of the gastrointestinal tract that is the site of massive hemorrhage without finding the site or cause, is known only to those of us caught in this predicament. Some authorities cite a figure as high as 20% for these frustrating cases even when the bleeding is known to be above the ligament of Treitz.

Nothing is more profoundly distressing to the surgeon than failure of the coagulation mechanism in a patient with gastrointestinal tract bleeding. Every effort must be made by history and first examination of the bleeding patient to determine that the platelet count, liver function, prothrombin time, and other factors in his coagulation mechanism are normal. In these investigations the knowledge of the hematologist, internist, or medical practitioner may save the patient and the surgeon needless or dangerous surgery. I want to stress again the infinite help given by a careful history if this is available from patient or family. Discovery of any one of numerous medical or hematologic conditions producing hemorrhage may relegate the case immediately to a nonoperative category.

The next major concern is to determine as accurately and quickly as possible the site and source of the bleeding. Investigation of this is carried out while the patient is being supported by fluids and blood transfusions. Dr. John Stewart, of the University of Buffalo, and many others have developed elaborate programs for studying serious gastrointestinal bleeders with blood volume determinations, esophagoscopy, emergency gastrointestinal series, radioisotope tagging of cells, and miscellaneous other tests. Some simple but valuable aids, such as the passage of a simple nasogastric tube, may help establish the level of bleeding. The Saenstaken-Blakemore tube may be used to advantage.

The esophagus is a most interesting organ, which frequently is the site of bleeding. The subject of carcinoma with penetration and perforation of a major thoracic vessel is too great to be elaborated here. The diagnosis is often obvious or already known to the patient and doctor from previous studies of dysphagia. Such hemorrhages are all too often lethal before anything can be done.

The tremendous exsanguinating hemorrhages of ruptured varices resulting from portal hypertension are sad but frequent occurrences. I have the impression that with the increase in alcoholism we are witnessing, the incidence of this dreadful consequence is on the increase. The immediate control of bleeding from the ruptured varices by the use of the Saenstaken-Blakemore tube is a lifesaving measure. In most case, however, this is only a temporary expedient, and some more definitive measure must be taken to alleviate the portal hypertension that is the background for the bleeding.

Numerous operations such as the ligation of the varices, partial gastrectomy, transsection of the stomach have had their day. The results of these procedures are so poor that it has been determined that the only effective treatment is a direct attack on the portal venous system. The services of a general surgeon or a vascular surgeon familiar with these procedures are essential. The recommended routine is to control the hemorrhage with the Saenstaken-Blakemore tube, which allows some hours to replace the blood volume by transfusion and fluids, digitalize if necessary, and otherwise prepare for an urgent or emergent surgical procedure. The choice of splenorenal or portocaval shunt lies with the operating surgeon. Most authorities prefer a routine portocaval shunt, that is anastomosis of portal vein to inferior vena cava. While the morbidity and mortality are still disap-

pointingly high, the results are much better than with any other form of management. Results improve with experience, choice of procedure, and general management, so this is the recommended course, aggressive as it may seem.

Ulceration in the pouch of a diaphragmatic hernia may be the source of severe bleeding. The technical control of this at operation may be difficult, but this is the procedure of choice since recurrent hemorrhage is very likely.

In the Mallory-Weiss syndrome, bleeding follows severe retching and vomiting, although this does not often demand surgical intervention.

The stomach often is the site of massive hemorrhage. Vomiting of large clots of blood after a period of nausea points to bleeding from this source. Emergency x-rays of the gastrointestinal tract may point out the diagnosis, although the presence of clots may make interpretation difficult.

Benign conditions such as aspirin ingestion, inflammation, telangiectases, benign tumors, or gastritis may cause bleeding and occasionally demand urgent surgical care, although many of these can be handled without operation or be corrected later.

Peptic ulceration of the stomach is the most frequent cause of massive hemorrhage. Without biopsy, differentiation from cancer may be difficult. Polypoid carcinoma or massive infiltrative cancers may bleed, but this is much less frequent than peptic ulceration.

In bleeding from the stomach and duodenum, a number of factors must be considered. Age of patient, severity of hemorrhage, availability of blood, odd blood types, or the general condition of the patient may dictate early surgical intervention rather than persist too long with cold lavage, small transfusions, and general support in the face of continuing hemorrhage. It is sad to be called upon to perform major surgery on a patient almost in extremis, with scarce blood replacement almost exhausted, with blood matching difficulties, with continuing hemorrhage. Mortality and morbidity increase alarmingly in such cases.

Acute or severe chronic hypertrophic gastritis may cause bleeding but often do not require operation.

The most frequent cause of gastrointestinal tract bleeding demanding surgical intervention is peptic ulceration of the duodenum. The tremendous frequency of this ailment accounts for this complication. History and physical examination, vomiting of clots, bright blood in the nasogastric tube, and emergency x-rays often make the diagnosis evident. In the young patient, active conservative care may control the emergency without surgery; however, in many cases, active consultation between medical man and surgeon will bring the case to corrective surgery before the ridiculous level of 15 to 20 pints of blood transfusions has been reached.

The choice of operative procedure varies with the surgeon, with proper consideration of history, age, general condition, and associated conditions. At surgery, the stomach and duodenum are opened and the abnormality verified. It is essential that the bleeding vessel be controlled by transfixing it with a nonabsorbable suture, usually silk, but more must be done to prevent recurrence of the bleeding. The time-honored procedure of subtotal gastric resection is still valuable and reliable, and the older surgeons still lean toward this. The trend today, however, is to ligate the bleeding vessel and then perform a drainage operation, such as a pyloroplasty, using the gastroduodenotomy incision, and performing a vagus nerve section at the same time. This affords definitive treatment of the ulcer diathesis while avoiding the longer operation for the patient whose condition is precarious and also avoiding the infrequent but annoying sequelae of gastrectomy.

The gastric freezing procedures have had only limited acceptance by the surgical specialists, so these will not be discussed.

I cannot pass over this region without mentioning an infrequent but interesting entity: carcinoma of the ampulla of Vater. The presence of occult blood in the stool and a faint tinge of jaundice may give away the diagnosis. The extensive operation of pancreaticoduodenectomy (the Whipple procedure) has been effective in salvaging a fair number of these patients.

Benign tumors and diverticuli rarely produce bleeding.

Bleeding from the jejunoileum is not a common finding, but when it does occur, it may be severe and dramatic. In children, especially, a most frequent cause of severe rectal bleeding is bleeding from a Meckel's diverticulum. This may be of life-endangering proportions and require emer-

gency surgery with removal of the diverticulum by resection. Diverticuli, polyps, leiomyomas, benign ulceration, or the very rare malignancy may cause gastrointestinal hemorrhage and should receive appropriate treatment.

A source of occult bleeding rather than major hemorrhage, yet causing severe anemia, often obscure and overlooked for months, is carcinoma of the cecum. These large growths rarely obstruct and so may grow large and bleed for a long time before they are detected. A high degree of suspicion and careful x-ray inspection of the cecum will help diagnose these so appropriate surgery can be performed. In this condition, the terminal ileum, cecum, ascending colon, and transverse colon to the middle colic artery, together with the mesocolon, are removed. A worthwhile salvage is obtained in many cases.

Benign growths of the large bowel often cause bleeding and should be diagnosed and treated. Lipomas may occasionally do this, but the most frequent are polyps, both benign and malignant, occurring throughout the colon. Bleeding sometimes is profuse. Sigmoidoscopy, barium enema, and air contrast enema usually confirm this diagnosis. Any of these polyps may be malignant, so all should be removed surgically with subtotal colectomy often indicated. If the bleeding is severe or protracted, we may be forced to explore without knowledge of the exact location of the bleeding point. Visualization of the bowel lumen during operation by means of the sterile sigmoidoscope may help to reveal the bleeding polyp and perhaps other polyps not otherwise suspected.

Another frequent cause of rectal bleeding, occasionally in large amounts, is diverticulitis. This condition can produce a considerable hemorrhage, often without recurrence; or bleeding may recur in some cases. Symptomatic cases may require resection for final cure.

The most frequent and urgently important lesion causing severe recurrent bleeding from the colon is carcinoma. In the transverse descending and sigmoid colon, the napkin-ring type of annular constricting carcinoma will bleed many times long before the ultimate intestinal obstruction occurs. Therefore, all cases of bright bleeding, brisk or of small volume, demand thorough investigation and early surgical intervention. Appropriate wide resection of bowel and mesocolon so as to insure removal of all lymphatics gives a fine prognosis in many of these cases. Delay in surgery due to patient neglect to report rectal bleeding, or delay by the physician for any reason past a short interval, is inexcusable in this enlightened day.

The medical conditions of the large bowel, comprising the colitis group, are usually well managed with diet, medication, including the corticosteroids, reassurance, and mental help. Occasionally one sees the fulminating case with 18-30 grossly bloody stools per day. Unless surgery is done relatively early, one is likely to find himself with a severely depleted patient in precarious general condition requiring massive emergency surgery. Early ileostomy with wide resection is necessary in these cases.

Rectal carcinoma is one of the most frequent sources of bright blood from the rectum. Nearly all of these cases can be diagnosed by a simple digital rectal examination. It is absolutely inexcusable to fail to do this examination routinely. Biopsy by sigmoidoscope makes the diagnosis certain. While some surgeons have performed low anterior resection, the principles of en bloc resection with blood and lymphatic drainage resection requires abdominoperineal resection. Results in the operable cases are surprisingly good.

A word must be said here about the lowly hemorrhoids. This condition is the sole cause of bleeding at the rectum in many cases, so the patient may have an unwarranted reassurance sometimes bolstered by the opinion of a physician without adequate examination. We err too often on the side of inadequate examination when hemorrhoids are visible and palpable. My plea is for complete examination to rule out other causes of bleeding at the rectum before accepting the hemorrhoids as the sole cause. When no other conditions are found, a well performed hemorrhoidectomy will correct matters easily.

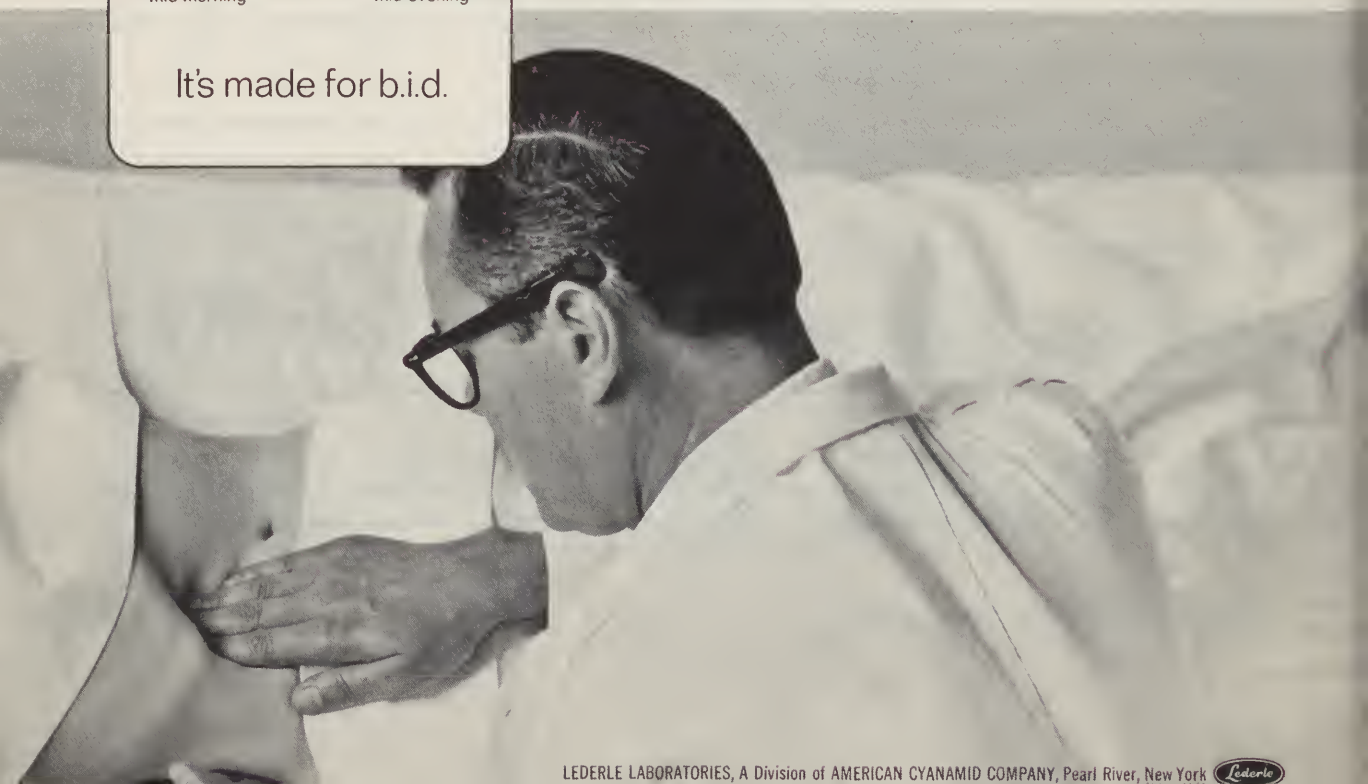
DECLOMYCIN®

DEMETHYLCHLORTETRACYCLINE

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.



Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

LEDERLE LABORATORIES, A Division of AMERICAN CYANAMID COMPANY, Pearl River, New York

No one is called upon more often to help in marital problems than the physician, particularly if there is a problem in sexual adjustment. Our esteemed position of healer and confidant and our knowledge of the human body, its functions and frustrations, lead our patients to expect assistance from us. Yet our medical education generally has not prepared us well to fit this particular role, and frequently our own bias and sensitivities make such counseling difficult if not painful.

Some ideas of how the average physician might help his patients are presented, along with advice about pitfalls to avoid.

Jonas R. Rappeport, MD

SEX IN MARRIAGE COUNSELING

Recently the medical profession has shown a strong interest in sex! That is, from a scientific and professional standpoint. It seems a little embarrassing, however, when we realize that only two or three medical schools in the country, even today, actually offer courses in sex. One of the reasons that there have not been courses in sex previously is that a thorough knowledge of the subject was not available, at least not in scientific form. All of us have had to learn the hard way, by personal experience. Unfortunately, this is a dangerous way to learn about sex, particularly if we try to apply it to our patients. If we use our personal experiences and feelings as a foundation for giving supposedly scientific clinical advice, we are going to run into trouble, and that is exactly what happens.

We devote a tremendous amount of research time to the most minute factors in illness and work diligently in the area of preventive medicine. But we have treated sex as if we, the medical profession, were all a bunch of virginal old maids. We have been following social custom instead of leading medical knowledge. Now we are way behind. Whether we like it or not, there have been and are terrific social upheavals in our culture, and a main area of such change is within the area of sexual behavior. These changes may be alien to our own personal standards, but we must accept what our patients regard as proper behavior.

Twenty or thirty years ago, I doubt if the average gynecologic patient would give an honest answer to her doctor, even if he dared to ask her about her sexual adjustment. The urologists, gynecologists, and other practitioners are being consulted more frequently today by patients with problems of sexual adjustment. Are we prepared to help any of these patients? I suspect that many of us aren't, and those who are, have tools which are of limited effectiveness. Nevertheless, we must use what we have. Havelock Ellis and Richard von Krafft-Ebing were followed by Sigmund Freud, whose understanding of infantile sexuality did a great deal to bring us out of the

Presented May 3, 1966, at the Bermuda Cruise Convention of the Medical and Chirurgical Faculty of the State of Maryland.

hinterlands. The fact that much of what Freud discovered was misunderstood and at times misapplied was probably due to our not being quite ready for it. Today, the work of Lorenz and Scott on animals, and Ford, Beach, Mead, Lloyd, Masters, Winokur, Lief, and countless others on human sexual behavior have opened up the scientific arena to a fuller understanding of this basic biological drive. Now we are more ready to understand, and we are gaining more knowledge of the physiology, psychology, and sociology of sex.

Today, I shall try to limit my comments to the general area of sex in marriage counseling and shall try to frame my comments within the context of those situations with which most physicians might come into contact. I shall avoid discussing entirely the physiology of sexual behavior but shall focus on the psychological aspects.

Sexual behavior would appear to be the result of the learning of group or culture specific patterns. Every society that has been studied seems to have its own specific sexual behavior codes, which generally serve as a part of the overall social and moral code of the community. We are so used to our own forms of behavior that we tend to define them as "the natural or God-given way." Beach reports that in New Guinea the female inferior position of intercourse is called "the missionary position." Among a particular Australian native group, when a virginal daughter is about to get married, the father calls on his best friend to introduce his daughter into the art of sexual behavior; and the best friend's wife performs the same function for the bridegroom. In some other cultures, adolescent heterosexual activity is encouraged, and upon entering marriage, each partner is well experienced. After marriage, however, no infidelity is allowed, and severe punishment is extracted if caught. Eskimo husbands, on the other hand, graciously loan their wives to visitors.

In the United States, we find different standards of sexual behavior in different socioeconomic classes, as well as in persons with different ethnic and religious backgrounds. It is difficult for middle class people to understand the behavior of the lower class male, and even more difficult for the female to understand comparable behavior. The lower class male is much more sexually experienced at marriage, considers masturbation unnatural, and is generally unconcerned about the female's sexual needs or pleasures. Preplay is of little interest to him, his own satisfaction being his primary concern. In contrast is the American middle class male, who may be more or less inexperienced at marriage, who has used masturbation as a release for years, and who enjoys preplay and considers himself a failure if his wife doesn't have an orgasm. Coupled with the male's feelings are the respective desires of the female, according to her upbringing.

One can readily see the problems that might arise if a physician attempts to counsel patients only from his own experience without some thought to and respect for the patient's own standards. Imagine the problems that a couple might have on coming from different cultures with varied expectations, desires, and limitations. Hence, the first and perhaps most important step in the evaluation of a marital sexual problem is a thorough and adequate history with particular emphasis on the sociocultural and religious background of the couple and how this affects their sexual practices.

A word of caution is indicated here. With our current emphasis on sex, people frequently present their problem in sexual terms when it really isn't sex at all which is the problem. A woman may complain about her husband's lack of sexual interest in her when the truth is that he finds it hard to get interested in her because she is a "bug" on cleanliness, never comes to bed on time because she is still housecleaning, and makes him take a shower and shave before she'll have intercourse although he likes to go to bed unshaven. Or the man complains that his wife is not interested in sex, when the truth is that the only time he is interested is when he is "drunk as a skunk," and that is most of the time. These are not mainly sexual difficulties. Nevertheless, they were presented as such, and they are problems of marital discord which require counseling. Whether a given physician will want to become involved in trying to counsel such couples or not will, of course, depend on his time, personal inclination, etc. Some of us are particularly astute and sensitive to such situations and can do an excellent job. Others prefer not to become involved, actually aren't comfortable in such situations, and are better off referring such patients to the various church or community agencies or

to a psychiatrist, psychologist, or marriage counselor.

Do you look at your patients when you ask about their sexual adjustment, or do you look away? Do you ask a negative question "You don't have any problems in your sexual life, do you?" If you do these things, then you aren't the one to do sexual counseling. You had best examine your feelings before you try. However, in the area of true sexual difficulties, there is no one who can adequately replace the physician as the proper person to help the couple.

Probably the most common problem brought to the physician is not impotence or frigidity but a less serious difficulty. The most common is probably one which I call sexual incompatibility. Fortunately, boys and girls are different in more ways than simple anatomy. Males are more generally aroused by psychological factors, such as jokes, stories, pictures, or observation of the partially clad or nude body. Females, however, seem generally to have little response to such stimuli. Instead, they respond more to "love talk" and actual physical contact, and then only when their mind is free from worry or fatigue. Many men cannot conceive of this and feel hurt or angry when their wives do not respond to the same things which stimulate them. A factual discussion of this by the physician will frequently soothe ruffled feathers.

The variation in basic sexual tension between couples, when misunderstood, can frequently lead to feelings of rejection and eventually to hostilities. Generally, the male has a higher and more constant sexual tension than the female, whose tension is more variable. Each couple has to attempt to work this out according to their individual needs. To call one partner "oversexed" and the other "undersexed" is just name-calling. If the personalities are reasonably mature, they can make a mutual adjustment with help.

Women often fear being the aggressor in sexual activities, even though at times they have the urge to. Frequently they have gotten the message that their husband can't accept this. Many males, however, would like to be fairly passive on occasion, and such temporary role reversals can lead to extremely pleasurable experiences. The physician can perform a great service by helping a couple increase their communication about their sexual desires and needs.

The sociologists tell us we are a matriarchal society. Passive-dependent, sexually inadequate males pose a real therapeutic problem. Such a man has been so inculcated in the cult of mommism that he is afraid to be aggressive in bed. He always waits for his wife to make the overtures, his feelings are easily hurt, he is partially impotent at times, or has premature ejaculations. Thus, he handles his hostility, fear, and frustration. Many such men require psychotherapy, but some can be helped by encouraging them to be more aggressive in bed and particularly by joint counseling in company with their wives, if the latter are not overwhelming. I shall speak of this type of counseling in a moment.

Many women complain of their husbands in such a way as to make us immediately suspicious of the situation. Their numerous petty complaints usually point out the fact that no matter what he does, he has to be no good. The man, of course, can do the same. Almost invariably, the history will reveal the father or mother, in the respective case, as being a person the patient hates. Father was no good, so husband is no good. Usually sexual problems are also thrown in.

I am not advocating infidelity; yet, as we know, it does happen. When it does occur, people are hurt. It is always important, when infidelity has been discovered, to attempt to find out why it occurred and why it was allowed to be discovered. A note of caution here: when a patient tells you about being unfaithful, never advise him, or her, to tell the spouse if she doesn't know. If he feels he must, point out to him that he is doing it more to relieve his own guilt and possibly to hurt his partner rather than to help her. It can't possibly help her. The same immature, selfish motives go into telling as went into acting.

Whenever possible, in working with the less serious sexual problems, which I have mentioned so far, it is axiomatic to try to work with both partners. The technique most counselors use consists of, first, seeing the original complainant, then the spouse, and then both together, if at all possible. Because we are dealing with problems of interaction, we can usually get a clear picture in the shortest possible time in this way. Clear, frank discussions are most useful, and the goal should always be toward trying to increase the couple's communication between each other so that they can continue the work in your absence. It

is surprising how many couples will not tell each other what they like or dislike about the other's sexual behavior.

Generally speaking, sexual jokes are taboo in such counseling. Without being priggish, it is important for the patient to know that you are being warmly concerned, yet a scientific helper, not a wise guy. I know that many physicians don't have time to spend like this. We just have to do the best we can or refer the patient to someone else. Many patients don't mind paying more for the extra time when its need is explained to them.

In his excellent book *Counseling in Marital and Sexual Problems,* Dr. Richard Klemer makes some practical suggestions. During the individual interviews, he frequently asks each partner, "What would he say about you if he were sitting here?" and, "If you could have any solution you desire, what would you like?"

Axiomatic in such "family" or "couple" counseling is to let the partners talk as much as possible. The doctor is there to answer specific questions AFTER he knows what each partner thinks about the question. By allowing each person to express his ideas and feelings, you then know what is misunderstood and can apply your knowledge directly. Care should always be taken to avoid accusing one partner or the other of "bad" things. Instead, one might wonder, "If Fred feels that he is being entirely fair to Mary." This arouses less anger than the direct statement, "You aren't being fair." Direct advice sometimes is necessary, however, along with facts about anatomy and physiology, preferably given as suggestions rather than prescriptions. To tell a reluctant man to rub his wife's clitoris before intercourse, or her to manipulate his penis might produce good mechanical results but with little feelings. It is better to wonder if such has ever been done by them, and if not, why not. ("How come you haven't?") After everyone understands the aversions or resistances, it may not even be necessary to make a direct prescription. Whenever we ask, "Have you ever done such and such?" we are actually making a suggestion.

Masters and Johnson in St. Louis, have done a great deal of investigation in human sexual behavior. I have only read reviews of their latest book, but it seems to represent the most thorough investigation of sexual behavior to date. Masters has divided the more severe problems in the male into three categories: type 1, inadequate erection; type 2, premature ejaculation; and type 3, non-emissive erection.

The problems which the female presents can be considered under frigidity. It is important to remember that a woman should not be considered frigid just because she does not achieve orgasm every time she has intercourse; most women don't. Many authorities now believe that many women can be completely fulfilled without ever having an orgasm.

Most women are not able to have an orgasm when preoccupied or fatigued, although they may be quite capable when relaxed. Even under such circumstances, they can enjoy the sexual act passively. The three major factors which the female may present as causes of a real frigidity or dyspareunia are 1) attitude toward sex, 2) relationship with husband, and 3) fear of pregnancy.

Of course, the first level of investigation by any physician should be to eliminate any possible organic causes for these disabilities, either impotence, frigidity, or dyspareunia. Actually, there are not a great many physical causes for sexual inadequacy in either sex. Pituitary tumors or related lesions or physical trauma may be causes. Various hormonal or structural defects causing underdevelopment of the sexual organs must be considered, but these usually are obvious from the history or physical examination. Severe retroflexion of the uterus or inadequate lubrication of the vagina can cause dyspareunia, or it may be a conversion symptom after an industrial accident with some totally unrelated physical injury. My purpose is not to describe these physical causes, yet I do not mean to minimize them, since occasionally a serious yet correctable condition will first be presented as a sexual problem.

What about these patients? Let us take the male first. The male who has inadequate erection usually has lost confidence in himself, both as an adequate marital partner and as an individual. Often the more he tries, the less success he has, and he then attempts to avoid intercourse. Important questions in the history should relate first to his past sexual experience. Has he always had this trouble, or is it a recent development? Did it occur with premarital sexual relations with

his wife or others? Is it now only limited to his wife, if he has had other exposures? Did it come on suddenly or slowly? Does he obtain an erection with manual manipulation? What sort of homosexual experiences has he had? What is his basic attitude toward sex and toward his wife both before the problem and now? Is his marriage happy, or are there other factors disrupting it which might lead to his rejecting his wife in this manner? Is he a chronic alcoholic? As Shakespeare said of alcohol and sex, "It increaseth the desire, but taketh away the performance!"

Concerning the male with premature ejaculation, the wife usually makes the complaint, or the husband seeks assistance because of her complaints. Although today, particularly in our middle class culture, the male tends to feel more inadequate when he cannot satisfy his wife, some authors suggest that this can be a learned pattern from exposure to prostitutes who are always in a hurry. I question such a conclusion. The same type of history is required in order to understand the situation.

Masters' theory that the man who has no orgasm with intercourse requires only reassurance, since his wife has her orgasm and he achieves it by other means, smacks somewhat of therapeutic nihilism; yet psychiatric treatment of such patients may be long and tedious. In oversimplified psychological terms, such men won't even give a woman their sperm. While the nonerective male is completely afraid of the vagina, the premature ejaculator seems to be in between.

In the female, a careful history frequently reveals a negative attitude toward sex, usually as a result of family standards or associated with earlier traumatic experiences. This may lead to either frigidity or dyspareunia. Fear of pregnancy may also be a deterrent to satisfactory sexual relations, although it may also be used as a screen to prevent unenjoyable relations. Basic dislike of the spouse, his body odor, his size, etc., may be offered as deterrents. The physician must use his clinical judgment to evaluate such complaints. Are they genuine, and can they be simply corrected, or are they merely superficial complaints to cover a deeper problem? Frequently, if we question this patient carefully, she will show us whether her demands are impossible or not.

The more acute situations probably will respond to a good history taking and counseling in the areas concerned. The more serious problems, however, can represent deep and severe emotional disturbances which require referral for psychotherapy. Rather than spend time where it will probably do no good, one should try to avoid the "impossible" situations. A couple who have been married five or ten years without consummating the marriage or seeking any real help for it represents a gigantic task which should not be undertaken lightly. The same would apply to the impotent male who has been so regularly, or even off and on, for many years. Any chronic untreated situation is usually presented for treatment unwillingly in the first place, further denying the possibility of a therapeutic success.

With reference to these latter problems, another excellent book is *Human Reproduction and Sexual Behavior,* edited by Charles W. Lloyd. In it Masters describes briefly some direct and "mechanical" methods of dealing with these problems. For example, for the premature ejaculatory male, he suggests repeated "teasing" by the wife, advancing to the point of reading a book with the penis in the coital position. Naturally, any such methods require a great deal of mutual desire, determination, and cooperation on the part of both and, while useful, must be understood to represent only a part of the treatment. The psychological factors cannot be easily overcome even by way of such training methods. One inventive colleague suggested that the patient's wife place ice cubes against her husband's scrotum if he were about to climax too soon. I wonder if such a cure might not be worse than the disease. In any event, it was not effective in the case I heard about. On the other hand, while I, personally, cannot ascribe to such heroic methods of treatment, some of these problems represent serious difficulties and do require imagination.

One of the most important things we have to offer such patients is hope and encouragement. They need a great deal of support and help in not feeling weak or freakish. In merely helping them to overcome their feelings of inadequacy, which are increased with each failure, we can be of tremendous help.

I spoke before about the significance of the history. Past experiences are the foundation of present sexual attitudes and behavior. The male

MEDICAL AND SURGICAL SUPPLIES

who has been raised fatherless, sleeping with his mother and sucking her breast for comfort until 6, and then is placed in an orphanage until 16, has a hard row to hoe. I worked with such a patient for several years in psychotherapy without his obtaining sexual success. I was able to help him become more assertive and more adequate in his trade. As frequently happens, he married a girl who had severe dyspareunia, which didn't help the situation, and she would have no part of conjoint therapy, blaming all the difficulty on her husband.

There was, however, another man whose early life was reasonably normal, but he suffered severe trauma by witnessing an abortion performed on his mother in the next room, during which she hemorrhaged severely and almost died. His premature ejaculations were associated with his fear of getting his wife pregnant. Some superficial insight into this, along with a mature and loving wife, enabled him to overcome this readily. Excessive guilt over previous sexual behavior, frequently masturbation, can cause a great deal of inhibition in male or female patients. Although simple confession followed by medical reassurance does not immediately solve such problems, joint counseling with continued support and a real desire to help each other often can produce good results.

Our attitudes must be the same ones that we would apply to any other medical problem, genuine curiosity as to the cause and a desire to help without embarrassment. A little extra reading on sexual problems is necessary, particularly now that some real scientific work is being done. As you overcome your reluctance to enter this "forbidden" area, you will find more and more patients who present problems in their sexual life, and you will find yourself able to help many of them. Don't be in a hurry, as such problems take time to improve; however, helping a couple become sexually adjusted is a rewarding experience.

this issue: emergency anesthesia and the common cold

When emergency anesthesia is complicated by the common cold

Barry Belonsky, M.D., F.A.C.A.
Staff Anesthesiologist, Hospital of The Albert Einstein College of Medicine, New York City

Medical facilities are often presented with unfamiliar patients who have unknown health histories. This is particularly true in emergency situations that arise due to accidents or acute illnesses. These cases may need prompt care requiring anesthesia, and if they involve colds, nasal allergies or other upper respiratory infections, can account for many complications which make up a major hazard during emergency anesthesia.

Administration of general anesthesia to a patient with a cold or upper respiratory infection is a hazardous undertaking. It should be avoided if at all possible. Indeed, the presence of U.R.I. is good reason for postponement of elective surgery.[1] In emergency surgery, regional or local block should be considered, but if general anesthesia is mandatory, it should be approached with utmost caution.

Since the attitude of "emergency surgery — hurry" has been replaced by "emergency surgery — watch out",[2] a knowledge of the complications is a great help in preventing them. Here is a brief outline of the problems involved and their treatment. Prevention of the complications is discussed later.

Complications during the induction of anesthesia

Most of the complications are a direct result of secretions and some a result of accompanying secondary infection. For example, *airway obstruction* due to excessive secretions occurs very commonly and is the direct effect of the cold. Respiratory exchange may be obstructed at any time during anesthesia because of excessive secretions, but is most likely to occur during induction. Suction apparatus must be available to overcome this.[3]

Excess secretions which stimulate and irritate the epiglottis and vocal chords can cause *laryngeal stridor and obstruction*. This can lead to complete laryngeal closure with resultant anoxia and death.

Bronchospasm and laryngospasm can result from secretions penetrating the bronchi and bronchioles. In laryngospasm, there are both inspiratory and expiratory stridor and difficulty in inflating the chest; in bronchospasm there is an expiratory wheeze, but not as much difficulty in inflation, although some resistance may be felt. Stridor is due to partial or complete closure of the vocal cords in spasm and the "crowing" sound is almost pathognomonic.

Secretions obstruct the nasal airways. This produces *difficulty in ventilation* through the mouth until the patient is deep enough to place an oral airway. An intravenous agent can be given to facilitate the induction of anesthesia.

Difficulties can arise if intubation is performed to ventilate the patient. For example, teeth can be broken by too vigorous attempts at intubation, or the intubation itself may be technically difficult due to secretions obstructing the view of the glottis. The postoperative sequelae of intubation ranges from mild laryngitis to pneumonia with atelectasis, and are seen far more commonly in patients suffering from colds than in normal patients.

Successive stages of laryngospasm which produce the characteristic stridor or "crowing" sound.

Progression of bronchioles into bronchospasm.

Complications during the maintenance of anesthesia *Bronchospasm* can occur in an unintubated patient due to secretions entering the bronchial tree from above, and acting as an irritant to the bronchi and bronchioles. Secretions accumulate quickly and the patient has to be suctioned continually. The whole cycle of coughing, bucking, laryngospasm and bronchospasm may ensue. The difficult decision here is whether it is better to suction the patient continually or to use an endotracheal tube which protects the cords and bronchi but introduces the risk of attendant complications.

Postoperative complications Postoperatively, complications can be more serious than even the intra-anesthesia complications, and occur much more frequently in a patient who has been intubated.[4]

Sore throat and pharyngitis can result both from the preoperative upper respiratory infection and from the drying of the mucous membranes which occurs during anesthesia.

Tracheitis and bronchitis often result from secretions trickling down the tracheobronchial tree.

Laryngitis is frequently seen in patients with upper respiratory infections who have been intubated. There is a significant increase in the incidence of laryngitis compared to that in patients without upper respiratory infections.

Subglottic edema is a condition which occurs mainly in children who have been intubated. This pathology results from an exudate developing in the areolar tissue just below the cords. Because of the small size of the child's trachea, even a 1 mm increase in size of the mucous membrane can severely impair the air passage. Children exhibit this by severe expiratory stridor and may even become cyanotic. This may so severely embarrass the child's breathing that it must be treated vigorously. Most authorities agree on the treatment[5,6,7,8] consisting of a high oxygen concentration in the inspired air (60%), plus high humidity (close to 100%). Adequate parenteral fluid intake and slight cooling of the body temperature (by a cooled oxygen tent) also help in mild cases. In severe cases, there may be hypoxia which increases the restlessness and the oxygen demand rises. Sedation is often necessary, although concomitant depression of the respiratory center is undesirable. An antihistaminic accomplishes this purpose well, and adds sedation. Since there is always a possibility that an allergic response plays a role in edema, some relief of the respiratory distress may occur. Steroids should be used to control inflammatory and allergic phenomena and swelling. If all this fails, and the patient is still restless and hypoxic, a tracheostomy should be performed immediately.

(concluded on following page)

Your patient can breathe easily, flying from New York to Rome, on just one Triaminic timed-release tablet.

One tablet goes a long way. For 24 hour relief of nasal congestion and postnasal drip due to sinusitis, colds and respiratory allergies—simply prescribe one Triaminic timed-release tablet, swallowed whole, in morning, mid-afternoon and at bedtime.

Side Effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness, or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

Each **Triaminic**® timed-release tablet contains...

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Cross section of trachea showing subglottic edema and lumen reduction due to mucous membrane congestion.

Pneumonia may also follow anesthesia administered to a patient with a cold. This can be caused by accumulated secretions becoming secondarily infected and causing consolidation of the lung. *Atelectasis* of the lung can result if one of the bronchioles becomes plugged by secretions, preventing aeration of the distal part of that lung. This is seen more frequently following upper respiratory infection because dry anesthetic gases aggravate the infection, causing secretions to change from watery to thick and viscid, and consequently difficult to suction.

Prevention of complications The first rule to prevent complications, of course, is to use a regional or local anesthesia whenever possible. But when emergency surgery is a must, in spite of the presence of a cold, allergy, or upper respiratory infection, here are some ways to prevent complications.

Give nose drops preoperatively. This can help shrink the congested nasal mucous membranes and reduce secretions for better air passage. (Results of this method are sometimes unsatisfactory because of the short duration of effect or rebound congestion.) For longer effect, oral antihistamines with nasal decongestants are often given to provide and maintain a drying effect on secretions.

To clear the tracheobronchial tree, instruct the patient to cough preoperatively. Cold steam or water nebulizers effectively humidify the nasal, pharyngeal and bronchial passages and often make the patient more comfortable. Tenacious secretions become more watery under humidification, clear more thoroughly preoperatively and are more easily suctioned from the airway during anesthesia.

Give intravenous fluids to those patients who appear dehydrated due to a cold. In a well hydrated patient the respiratory tract secretions are less viscid and more watery. This is particularly true in asthmatics.

Summary: Administration of emergency anesthesia to a patient with a cold or upper respiratory infection can lead to a chain of events that may result in increased postoperative morbidity and even death. This is because of the excess secretions formed in these conditions. Preoperative measures to prevent or reduce these secretions should be undertaken and will result in smoother and safer anesthesia.

An expectorant that makes coughs count by increasing respiratory tract fluid nearly 200%—plus an oral decongestant to relieve a probable cause of cough, postnasal drip. Your patients receive these benefits when you prescribe...

Triaminic® *Expectorant*

Each teaspoonful (5 ml.) contains:

Phenylpropanolamine hydrochloride	12.5 mg.
Pheniramine maleate	6.25 mg.
Pyrilamine maleate	6.25 mg.
Glyceryl guaiacolate	100 mg.
Alcohol	5%

Dosage: Adults—2 teaspoonfuls; Children 6 to 12 years—1 tsp.; Children 1 to 6 years—½ tsp. Administer every four hours. Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness, or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

brings peace to the hyperactive colon

CANTIL®
(mepenzolate bromide)

helps restore normal motility and tone

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

A Case of Spontaneous Chylothorax

Report of a patient with this rare condition and discussion of its anatomic basis.

LOUIS R. SCHOOLMAN, MD

Spontaneous chylothorax is rarely seen in private practice or even in a large metropolitan general hospital. Among 1,168,760 general admissions to the Charity Hospital, New Orleans, from 1936 to 1956, Nix[1] found only four cases, which included cases of chylous effusion into the peritoneal and pleural cavities. There were no cases limited to the thorax.

CASE REPORT

A spinster, age 76, was treated on March 29, 1964, for a febrile respiratory infection. Her acute symptoms subsided within a week. On May 13, she was examined for congestive failure with 2+ pedal edema, palpable liver, and right pleural effusion. Her leukocyte and differential cell counts were normal; hematocrit value, 33%; and blood urea nitrogen, 18.5 mg/100 cc. X-ray on May 14 showed the lower two-thirds of the right lung field obscured by pleural fluid.

After the congestive failure had been relieved through diuretics and digitalis, I tapped her right chest and withdrew 350 cc of chylous fluid. Bacterial studies, including culture for tubercle bacilli, and a cell block examination, were performed and found negative.

An x-ray on May 20 showed only slight decrease in fluid. On May 26, 800 cc of fluid was drained from the right pleural cavity. Bacterial and cell block findings again were negative.

The effusion recurred, and on June 19, 1600 cc of fluid was aspirated. A fragment of pleura obtained for histologic examination was found to be normal.

An intravenous pyelogram showed a small kidney on the left, bilateral hydronephrosis, and, in the pelvis, a 10 cm calcified uterine fibroid which the roentgenologist considered not responsible for the hydronephrosis.

At this point, I thought that the patient should be hospitalized for more detailed studies of the genitourinary and gastrointestinal tracts, but she did not remain long enough for diagnostic studies to be completed.

One month later, after withdrawing 900 cc of fluid from the right side of the chest, I prescribed chlorambucil for her probable lymphoma. The patient took the 6 mg per day intermittently for two weeks and then stopped because it "upset her stomach."

On October 26, 750 cc of fluid was aspirated. The roentgenologist reading the check-up x-ray suspected a neoplasm in the mediastinum, but tomographic studies revealed only a calcified lymph node. The patient continued in fairly good health. Aspiration on February 9, 1965, showed no increase in fluid.

On March 12, I learned that her long-time per-

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

sonal servant and cook had open pulmonary tuberculosis. I prescribed isonicotinic hydrazide and pyridoxine for the patient. On June 13, after 1,700 cc of fluid had been aspirated, an x-ray showed essentially clear lung fields. The leukocyte count was 8,900 with normal differential cell count; hematocrit value, 34%; sedimentation rate, 14 mm.

The patient consulted me on July 9 because of swollen feet. Examination revealed 3+ pedal edema and extensive right pleural effusion. Thiomerin was given. She refused to permit aspiration.

On July 15 she was found confused and aphasic and was admitted to the hospital. She was disoriented and mentally confused but had no paralysis. She had a grade 2 arcus senilis, complete cataract of the right lens and incomplete cataract of the left lens. The pulse rate was 96; blood pressure, 130/80; and heart sounds were clear and regular. The chest was flat to percussion up to the fourth rib on the right. Abdominal findings were essentially negative except for the calcified uterine fibroid extending above the pelvis.

Laboratory study revealed the following values: hemoglobin, 9.5 gm/100 cc; hematocrit, 29%; WBC, 5,200 with normal differential; serum urea nitrogen, 45 mg/100 cc; and fasting blood glucose, 94 mg/100 cc. Urinalysis showed 1.008, with protein, sugar, acetone, and microscopic findings negative. A review of the peripheral blood showed a reticulocyte count of 0.3% and no signs of nutritional anemia.

X-ray showed pleural fluid up to the third intercostal space. Electrocardiogram showed a right bundle branch block, SA tachycardia at a rate of 100, and non-specific myocardial change. The intradermal tuberculin reaction was positive and histoplasmin reaction negative.

I aspirated 1,300 cc of chylous fluid, and gave 500 cc intravenously. Six days later, 1,200 cc was aspirated and 500 cc given the same day and the next day. By the fourth her mind was clear, she spoke almost normally, and was ambulatory. The serum urea nitrogen had dropped to 24.5 mg/100 cc. She was discharged on July 26, free from edema, alert, and energetic.

During the next week at home her condition deteriorated rapidly. She ate poorly and irregularly, took salt at will, and refused medication. Pleural effusion mounted and pedal edema reappeared. She was hospitalized on August 5. On admittance, she was confused and hostile. Physical findings were essentially the same as those on her previous admission, but the hematocrit value had dropped to 25% and hemoglobin value to 7.5 gm/100 cc. Urinalysis showed 1+ protein and a high WBC. On admission the SUN value was 16.3 mg/100 cc, but rose during the next two weeks to 84.2 mg/100 cc. X-ray showed reaccumulation of right pleural fluid.

One the day of admission, 1,000 cc of chylous fluid was aspirated and 500 cc given intravenously. Another 500 cc was given the next day. On the third and fourth days, 500 cc of blood was transfused, raising her hematocrit to 37%. Because of the pyuria and rales in the left lung, streptomycin and penicillin were given intramuscularly for five days.

The patient remained hostile. On the fifth day, she turned her face to the wall and refused to talk or to take food. She lapsed into coma and died on August 30.

On postmortem examination, a retroperitoneal lymphoma invading the left kidney was found. The thoracic duct was not found. There was no evidence of tuberculosis.

DISCUSSION

Spontaneous chylothorax is usually associated with chylous ascites. A convenient etiologic classification was made by Hoffman.[2]

1. Compression or obstruction of the thoracic duct by malignant growths, primary or metastatic, including cystic hygroma of the neck and mediastinum.

2. Tuberculous adenitis causing compression or ulceration of the thoracic duct.

3. Thrombosis of innominate or left subclavian vein with obstruction of thoracic duct; aneurism of the duct itself.

4. Various medical entities such as filariasis and cirrhosis.

In 1911, Wallis and Scholberg[3] made a comprehensive survey of the literature from 1865 and found 27 cases of nontraumatic chylothorax and chylous ascites. The causes were:

Intra-abdominal carcinoma	10
Lymphoma	7
Tuberculosis	3
Cirrhosis of liver	3
Heart disease	1
Undetermined	3

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

WARMTH
FOR COLD
HANDS AND FEET

GERILID™

Each chewable tablet contains:
nicotinic acid (niacin) 75 mg. and
aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

BURROUGHS WELLCOME & CO. (U.S.A.) INC.
Tuckahoe, N.Y.

Only one patient survived.

Listerud,[4] in 1958, reviewed the literature from 1899 to 1956 and found 23 cases of chylothorax and chylous ascites. The causes were:

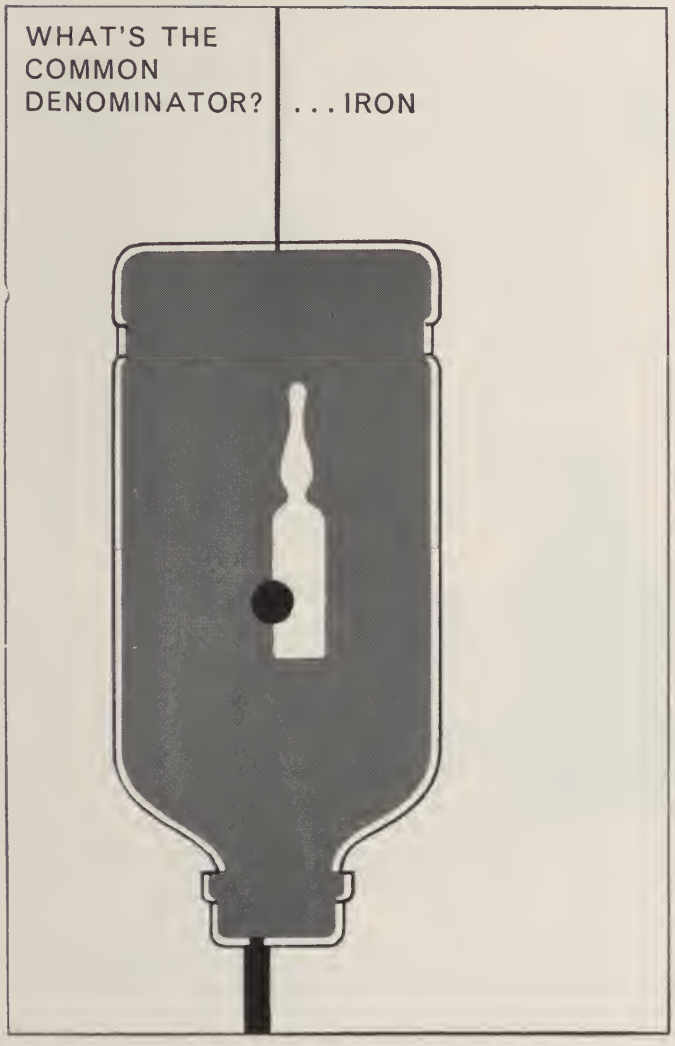
Lymphoma	6
Intra-abdominal carcinoma	3
Thrombosis of left subclavian vein	3
Tuberculosis	2
Retroperitoneal neurofibroma	1
Undetermined	9

Five of these patients survived.

Of the four cases reviewed by Nix,[1] the causes were:

Cirrhosis of liver	1
Adenocarcinoma of ovary	1
Lymphoma	1
Undetermined	1

The fate of the last patient was unknown; the others died.



Nix[1] described the anatomic basis of chylothorax. The cisterna chyli, which collects the lymph from the lower extremities and the abdomen and the chyle from the intestinal lacteals, lies on the anterior surface of the second lumbar vertebra. Its extension upward is the thoracic duct, which enters the chest through the opening between the aorta and the azygos vein. It then enters the superior mediastinum behind the aortic arch and the subclavian artery, between the left side of the esophagus and the left parietal pleura. The thoracic duct, being extrapleural throughout, when obstructed or torn allows chyle to collect retropleurally and produce chylothorax only after rupture through the pleura at the lateral ligament. The thoracic duct crosses from the right of the midline to the left at the fourth and fifth thoracic vertebra. Obstruction or injury below this crossing will produce right chylothorax and above it, left or bilateral chylothorax.

In fact, there's as much iron...250 mg. ...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

Homicides in Baltimore

SIDNEY M. NORTON
RICHARD T. SMITH, PhD

An analysis of homicides in Baltimore City in the 12-year period 1950-1961 reveals certain trends and characteristics of the victims. The highlights of these findings are:

SEX AND RACE—Most homicide victims are males, a high proportion being nonwhite moles.

AGE—Most victims were killed during the second and third decades of life. The overage age ot death for white victims is somewhat higher thon for nonwhites. The deviation about the mean is greater for whites than for nonwhites. The latter age distributions tend to approximate a normol curve pattern. The peak modal age categories for white femoles foll at the extreme ends of the age distribution, namely, under 15 ond 60 or over.

CRUDE RATE—Annual crude death rotes reflect certoin specific populotion trends within eoch sex-race group. Nonwhite mole homicide rotes have decreased over the 12-year period even though this group hos hod the highest crude rotes. Annuol crude rotes omong all other groups have remoined relatively stoble.

STANDARDIZED RATE—These rotes permit valid comparisons between groups ond over time. The death rates are highest omong nonwhite moles and have remoined in this relative position over the entire period. However, this same group has experienced o precipitous drop in the deoth rate. All other groups hove shown a slight rise in death rates. Nonwhite female deoth rotes ore second highest throughout the period, with one exception.

METHOD OF HOMICIDE—The most frequent method of homicide is the use of fireorms. The second method is the use of sharp, cutting, or piercing instruments. These two methods combined ore involved in almost eight out of ten homicides. The third most frequently used method is physical assault.

SITE OF HOMICIDE—Most men are killed in outdoor locations, while the modol cotegory for females is the victim's own residence.

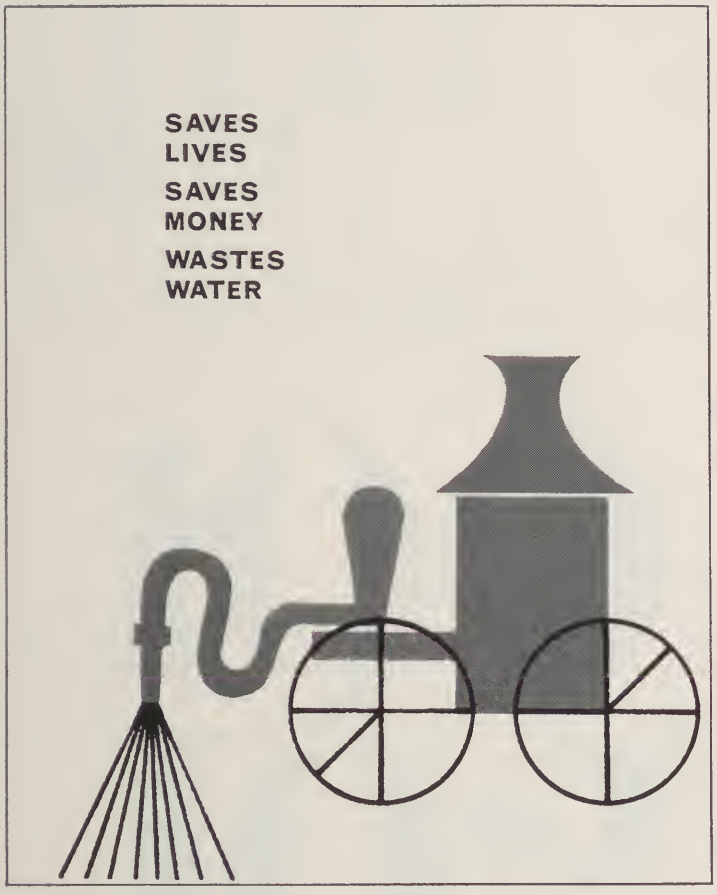
TIME INTERVAL BETWEEN INJURY AND DEATH—Annual overoge time intervols between injury ond death ore higher for males than for femoles. Non-white femoles have the lowest averoge time intervol. Viewed over the 12-year period, overage time intervals within eoch sex-roce group do not indicate any apporent trend.

Numerous authors have investigated the broad spectrum of crime in our society.[1, 2] Criminologists have described the pattern of criminality as encompassing two major types: crimes of personal violence and property crimes.* Crimes of personal violence are characterized by differing levels of seriousness in that some result in injury and some in death. This paper deals with those crimes which resulted in death and are defined as homicides.

We have examined the pattern of homicide deaths that have occurred over a 12-year period in Baltimore City. This report analyzes the trends of these homicides and describes some of the pertinent characteristics associated with the victims.

Data Collection

All known cases of homicide occurring in Baltimore City during the period 1950 through 1961 were included in this investigation. The number of unknown homicides not brought to the attention of the authorities is estimated to be extremely low. Reported homicides were initially collected by means of a systematic check of death records. Using the death registration number on the death certificate, a means of cross-reference



---

Mr. Norton is director, Bureau of Vital Records, Baltimore City Health Department, and an assistant in the Department of Chronic Diseases, Johns Hopkins University School of Hygiene and Public Health.

Dr. Smith is assistant professor, Department of Chronic Diseases, Johns Hopkins University School of Hygiene and Public Health.

This study was made with the cooperation of Russell S. Fisher, MD, chief medical examiner of the State of Maryland, and Captain George Klemmick and Lieutenant Anton Glover of the Baltimore City Police Department's Homicide Division.

*As an example, in 1960 crime rates per 100,000 reported as offenses known to the police show the following pattern: Murder, 5.0; rape, 8.9; burgulary, 456.5; auto theft, 177.6. Figures obtained from the *Statistical Abstract of the U. S.*, 1964, 85th Edition, Washington, D. C., 1964, Table 197.

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

was established with the Police Department's homicide record and the Medical Examiner's postmortem record. Information from each of these sources was transcribed to forms specifically devised for this study. Data included such factors as date and location of death, manner of homicide, the victim's address, age, race, sex, and marital status, and other pertinent aspects of the homicide.

Findings

A total of 1,077 homicides occurred during the period of investigation. The victims do not represent a cross-section of the city's population in terms of race and sex. Indeed, males of both races account for 74.5% (802) of all known homicides. The one-sided picture of homicides is further evident when observed on the white-nonwhite factor. Homicides among white members of the community constitute 24.9% (268) of cases, while nonwhites account for 75.1% (809). Nonwhite males account for 58.0% (625) of the total. Following, in descending frequency, are nonwhite females, 17.1% (184); white males, 16.4% (177); white females, 8.5% (91).

The age distribution of homicide victims by sex and race is shown in Table 1. The overall average age at death is 34.9 years, which is essentially the midpoint in the person's life span when viewed in terms of life expectancy. The average age of female deaths, 31.3 years, reflects a younger victim population as contrasted with males, 35.7 years. This same female to male average age discrepancy holds for both whites and nonwhites and amounts to a difference of between four and four and one-half years. Nonwhite females tend to be victims at a younger age, on the average, than any of the other sex-race groups. One striking feature of this table is the high proportion of deaths in the very young and the very old age groups among white females.

If one were to plot bar graphs using the age distributions for each group, it would bring into relief the fact that both male and female nonwhite distributions tend to reflect a normal curve pat-

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

tern, whereas for white people of both sexes, the pattern appears more dispersed across all ages. This contrast is particularly distinct for the male distributions. Homicides among whites seem more likely to occur in any age category, while among nonwhites most victims are in the 25-39 age span. This observation is partly a reflection of higher proportions of younger ages in the nonwhite population as contrasted with the white population.

To obtain a more meaningful interpretation of the differential pattern of homicides in the community, it is necessary to take into account the population distributions for each sex and race category. The result is the crude rate.* The crude rate is specific to the particular population base used and therefore is not directly comparable to a crude rate obtained by using a different population. Thus, comparisons in Table 2 can be made only horizontally within each row and not vertically within a given column.

Annual crude death rates by sex and race for the 12-year period are presented in Table 2. This table permits an overview of trends in crude rates

Appreciably high crude rates are observed for nonwhite males. Annual crude rates within this group show a peak rate in 1950 of 56.2 per 100,000 and diminish over 12 years to a crude rate of 31.8 per 100,000 in 1961. The crude homicide rate for the U.S. nonwhite male population in 1961 was 33.6 per 100,000.[3] The trend among white males over this period shows a slight increase, from a crude rate of 5.7 per 100,000 in 1950 to 6.6 in 1961. The crude homicide rate for the U.S. white male population in 1961 was 3.6 per 100,000.[3] The crude rates for white females during this period show a slight rise from 1.9 per 100,000 in 1950 to 2.6 per 100,000 in 1961. Among nonwhite females, there is a general indication of decreasing crude rates after the peak rate of 14.6 per 100,000 in 1954.

The annual crude death rate for all cases in Baltimore City was 9.8 per 100,000 in 1951 and 11.5 in 1960. Crude death rates for homicides in the United States population during the same period are almost one-half of the Baltimore City rates. In 1951, the U.S. death rate for homicides was 4.9 per 100,000 and in 1960 it stood at 4.7.[3] The U.S. rates are diluted by the inclusion of rural and other less urban areas where criminal homicide rates are low. Crude rates for urban areas of 250,000 population or more probably are comparable to Baltimore City rates.

TABLE 2

ANNUAL* CRUDE DEATH RATES FOR HOMICIDES, BY SEX AND RACE, BALTIMORE CITY: 1950 to 1961

(Rates per 100,000)

*Crude Rate = $\frac{\text{no. of cases}}{\text{total population}} \times 100{,}000$

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®

(desipramine hydrochloride)

non-sedating • rapid-acting
ANTIDEPRESSANT

helps restore normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) often reverses the signs and symptoms of depression including sleep disturbances feeling of sadness, guilt, anxiety, worthlessness and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

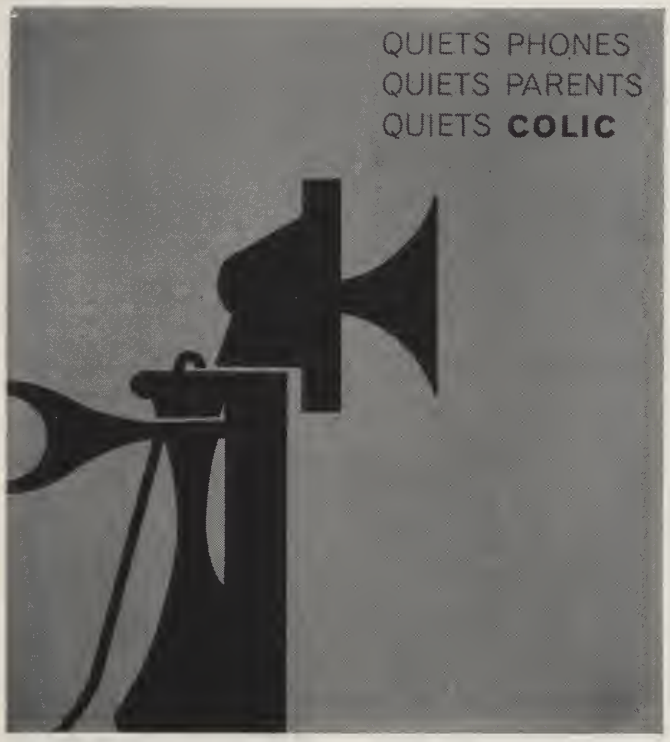
* Specific sex-race-age population distributions for other than the census years 1950 and 1960 estimated by interpolation using age-specific categories.

† Standard population: 1960 census of total population for Baltimore City.

A useful method for comparing rates among different population groups is called the direct method of standardization.[4] This method takes into account differences in sex, race, and age group distributions among the several classes being investigated as well as changes in these distributions over time. The resulting death rates are hypothetical rates that would obtain if each set of age-specific rates, for each sex-race category, were compared using identical populations.



The results of this standardization method for annual homicide rates observed for each sex-race group are shown in Table 3. By using this method, comparisons can be made both across and down the table. The striking feature of these standardized rates is the relatively high rate among nonwhite males for the entire 12-year period. The second important facet of this table is the precipitous decline in the annual rates for this same group. This is perhaps the more significant finding of the two mentioned. Furthermore, this trend among nonwhite males should be viewed in light of the fact that no other sex-race category shows an overall decline in rates for this period.

Among white males, the death rates have increased slightly over the 12 years but, in contrast to the nonwhite males, they are considerably lower. For females, the rates for nonwhites have remained consistently higher than whites throughout this period. In addition, nonwhite females have higher death rates than white males. In general, throughout the period under investigation, the nonwhites experienced higher homicide rates than the whites.

Other important characteristics of homicide pertain to the manner of homicide, the place where death occurred, and the time interval between injury and death. These factors will be discussed.

The methods employed in homicide are presented in Table 4. The most prevalent method is the use of firearms. This is characteristic of all sex and race categories except nonwhite males. Sharp, cutting, or piercing instruments, such as a knife, rank first for this group, with firearms a close second. Combined, these two methods account for 79.3% of all homicides in this group. These same methods account for 64.2% of homicides among nonwhite females. In contrast, the use of firearms and sharp instruments cause 58.6% of the deaths among white males and

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

54.9% among white females. The same pattern in the use of these methods was observed by Wolfgang in his study of criminal homicides in Philadelphia for the period 1948 to 1952.[5]

Death by sharp instruments is more characteristic of nonwhite than of white homicides. On the other hand, physical assault, such as being beaten or struck by a blunt instrument, accounts for a greater proportion of cases among whites than among nonwhites. A means predominantly used for females is strangulation. This finding is expected, since strangulation is likely to be used by the stronger male offender against his victim.

The method labeled legal homicide relates to

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

either judicial execution or justifiable homicide by the police. This method is characteristic of males only and primarily occurs among nonwhite males. Usually it is the result of police action in the line of duty, when a criminal suspect resists arrest or attempts escape. Of the 39 cases labeled legal homicide, the records show that 27 cases (69%) were due to injury by the police while the remaining 12 cases (31%) were legal executions.

The ecological distribution of homicides may be significant in relating the overall pattern of this crime with factors associated with the social milieu. In this respect, a meaningful distinction can be drawn between locations associated with the victim's own environment and the more general area of public domain. A homicide committed in the victim's home may involve a different set of factors in the victim-offender situation than one committed in some other private or public location. Furthermore, one can differentiate other factors in homicides that occur solely in the victim's home as being either domestic precipitated or intruder precipitated events.

In Table 5, homicides have been categorized into a number of primary sites, and the distributions shown are by sex and race. The major sites listed are residence, outdoor non-residence, place of employment, tavern or bar, prison or jail, and miscellaneous places. The residence category has been further delineated by taking into account the victim's status with reference to the household. Either the victim resided in the household ("own residence"), or the homicide occurred in some other household ("other residence"). Such homicides were also classified according to whether they occurred indoors or outdoors. "Other location—outdoors" includes such places as street, park, vacant lot, or river. The category, "other" is a potpourri of sites including automobile, public or commercial building, transportation terminal, or hotel.

Among male victims, the modal group falls into the category of outdoor locations. These homicides probably involve the victim in situations related to aggravated assault, robbery, and intentional murder. Both white and nonwhite male distributions show that a little over two out of every five homicides occur outdoors. The second most frequent site for males of both races is inside the victim's own residence. One out of every five white males and one out of four nonwhite males are killed in their home. These cases usually involve domestic issues within the family.

For nonwhite males, the third most frequent site of homicide is in a residence other than the victim's. The high proportion of cases occurring in proximity to the victim's residence, 29.7%, increases to 46.2% if other residential locations are included. This combined figure outranks all other categories in the nonwhite male group. The comparable figure for white males is 31.3%, which does not outrank the first category mentioned for this group, namely, other outdoor locations.

The third most frequent site of homicide for white males is his place of work, which presents a sharp contrast to that noted for nonwhite males. The residual categories shown in Table 5 for males account for fairly small proportions in each group.

For females, a distinct contrast is observed for the site of homicide and the proportion of cases in this modal category. Three out of five women are killed within the victim's own residence. Probably such homicides relate to domestic matters within the family or at least within the social web of proximate personal relations. The other factor pertinent to homicides in this situational context is that of intruder precipitated action. Both female groups show considerably higher proportions of cases observed for homicides occurring in proximity to residential locations. The combined figure for white females is 70.1% and for nonwhite females it is 75.4%.

One out of five females are victims in other outdoor locations. This site is ranked second in frequency. This situation probably involves an element of isolation from other persons, since most of the sites in this category are places that would be devoid of individuals at some time during any 24-hour period.

The final factor concerns the time interval between injury and death. In each case, the interval has been established from the records of the Medical Examiner's office and the Police Department. In a number of cases, the time of injury could only be estimated by the police or the coroner's office. In like manner, the time of death had been established afterward.

The average time interval has been calculated for each sex-race group for the years 1950-1961. These figures are presented in Table 6. The averages are not based on the original numbers in each

TABLE 6

AVERAGE TIME INTERVAL* BETWEEN INJURY AND DEATH FOR HOMICIDES, BY SEX AND RACE, BALTIMORE CITY: 1950 TO 1961

Year of Death	Sex and Race					
	Males		All Males	Females		All Females
	White	Non-white		White	Non-white	
	AVERAGE TIME INTERVAL

1961	0-15	1-05	1-01	4-02	0-23	1-23
Total	1-09	1-08	1-08	1-03	0-19	0-22

* Average time interval is shown as: No. of days — No. of hours.

group for these years. Insufficient record information resulted in the loss of cases in each of these groups. The residual number of cases in each sex-race group, for all years, are as follows: white males, 133; nonwhite males, 528; white females, 58; nonwhite females, 134.

The most noticeable difference in average time intervals occurs by sex. Female victims of homicide tend to survive for a shorter time than do males. In addition, nonwhite females show an overall average time lapse of 19 hours, while white females show an average of 27 hours. This latter average comes closer to the total average time intervals observed for both male groups. There appears to be no consistent trend in average time intervals over the 12-year period.

Most of my patients with high blood pressure are as old as I am. A lot of them are living on pensions. They're grateful when I can keep prescription costs down.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down

Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Geigy

following infection

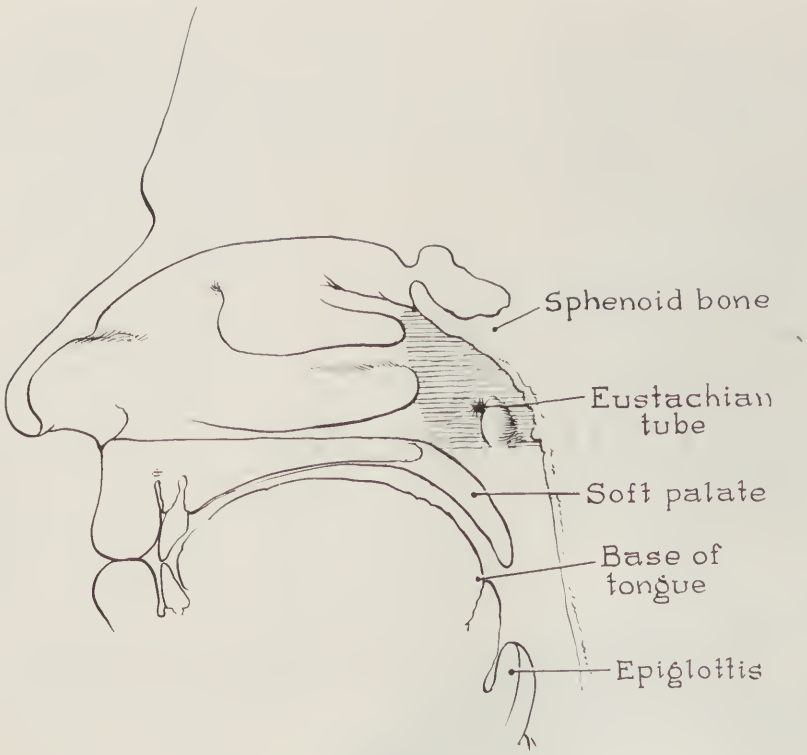
626-6—3612

Supervoltage x-ray therapy is curing a significant number of patients with nasopharyngeal cancer. Further improvement is possible through earlier diagnosis. The physician should consider this possibility whenever he encounters posterior nasal obstruction, epistaxis, or obstructive symptoms of the eustachian tube. Cranial nerve involvement and cervical metastases should alert him. The extent of the primary tumor often can be determined by means of x-ray of the skull and sinuses. A definitive diagnosis can be established by nasopharyngoscopy and biopsy of the lesion.

CANCER OF THE NASOPHARYNX



JERRIE CHERRY, MD
J. STEWART LOTT, MD
R. ROBINSON BAKER, MD

Cancer of the nasopharynx accounts for approximately 1% of all cancers occurring in the United States. Fifty per cent of these patients can be cured if diagnosis is made early in the course of the disease. However, there are still many patients being diagnosed in the late stages of disease. The average time lag from onset of symptoms to diagnosis is 11 months.[3] Awareness of the symptoms and signs of nasopharyngeal carcinoma, coupled with an increased use of cell washings and biopsy, will lead to earlier diagnosis and more cures.

Incidence.—This disease occurs more commonly in Caucasians than Negroes [3–5] and is three times as common in men than in women.[3, 4] The average age of onset is 51 years.[2, 3]

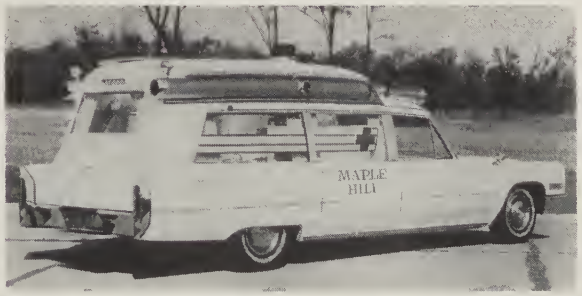
Anatomy.—The nasopharynx (Fig) is a medial space just posterior to the nose, beneath the sphenoid bone, anterior to the cervical vertebrae C_1 and C_2, and posterior to the dorsum of the soft palate. The lateral extent of this space is bounded by the eustachian tube orifices. This nasopharyngeal space is lined by respiratory epithelium and contains numerous lymphoid elements which in

From the Department of Otolaryngology, Division of Radiotherapy, and the Department of Surgery, The Johns Hopkins University School of Medicine.

The nasopharynx (shaded area) is bounded anteriorly by the middle turbinate of the nose, superiorly by the sphenoid bone, inferiorly by the soft palate, and posteriorly by the prevertebral fascia.

children and adolescents form the pharyngeal tonsils. This space is hidden from direct view and easy palpation. It is bounded on four sides by bone and is visualized only with an indirect mirror or nasopharyngoscope.

Symptoms.—The presenting symptoms vary with the anatomic location of the primary lesion within the nasopharynx and the biologic behavior of the tumor. They fall into three general patterns: 1) lesions causing local obstruction of the nose or eustachian tube; 2) lesions causing cranial nerve involvement and bony erosions; 3) lesions which metastasize to regional lymph nodes or to distant areas. Those lesions causing obstructive signs, such as nasal congestion, epistaxis, hearing loss, tinnitus, and otitis media, are most common. The group of patients presenting with cervical metastasis form the next most common group, followed by those patients presenting with cranial nerve involvement.[2, 3, 5] Few patients present with headache or dizziness.[3, 4]



Pathology.—Most malignant tumors in this region are carcinomas. These tumors characteristically are poorly differentiated and are associated with a high incidence of cervical lymph node metastases. In addition to squamous cell carcinomas, lymphoepitheliomas are commonly encountered in this anatomic area. These tumors are of epithelial origin but contain a heavy infiltration of lymphocytes. Small lesions within the nasopharynx are frequently associated with massive cervical metastases. Malignant lymphomas, such as reticulum cell sarcoma and lymphosarcomas, are also found occasionally in the nasopharynx.

A method of staging nasopharyngeal lesions has been suggested by Geist and Portmann.[1] A Stage I lesion is confined to the nasopharynx without palpable cervical lymph nodes or cranial nerve involvement; Stage II lesions have cervical node involvement but no evidence of cranial nerve involvement or x-ray evidence of erosion of the skull; Stage III lesions have local bony invasion of the skull with neurological signs; Stage IV lesions have distant metastases.

Therapy.—Radiotherapy is the treatment of choice for the primary nasopharyngeal lesion. When the aim of treatment is cure, either supervoltage or Colbalt 60 beam therapy is superior to the conventional x-ray from the standpoint of

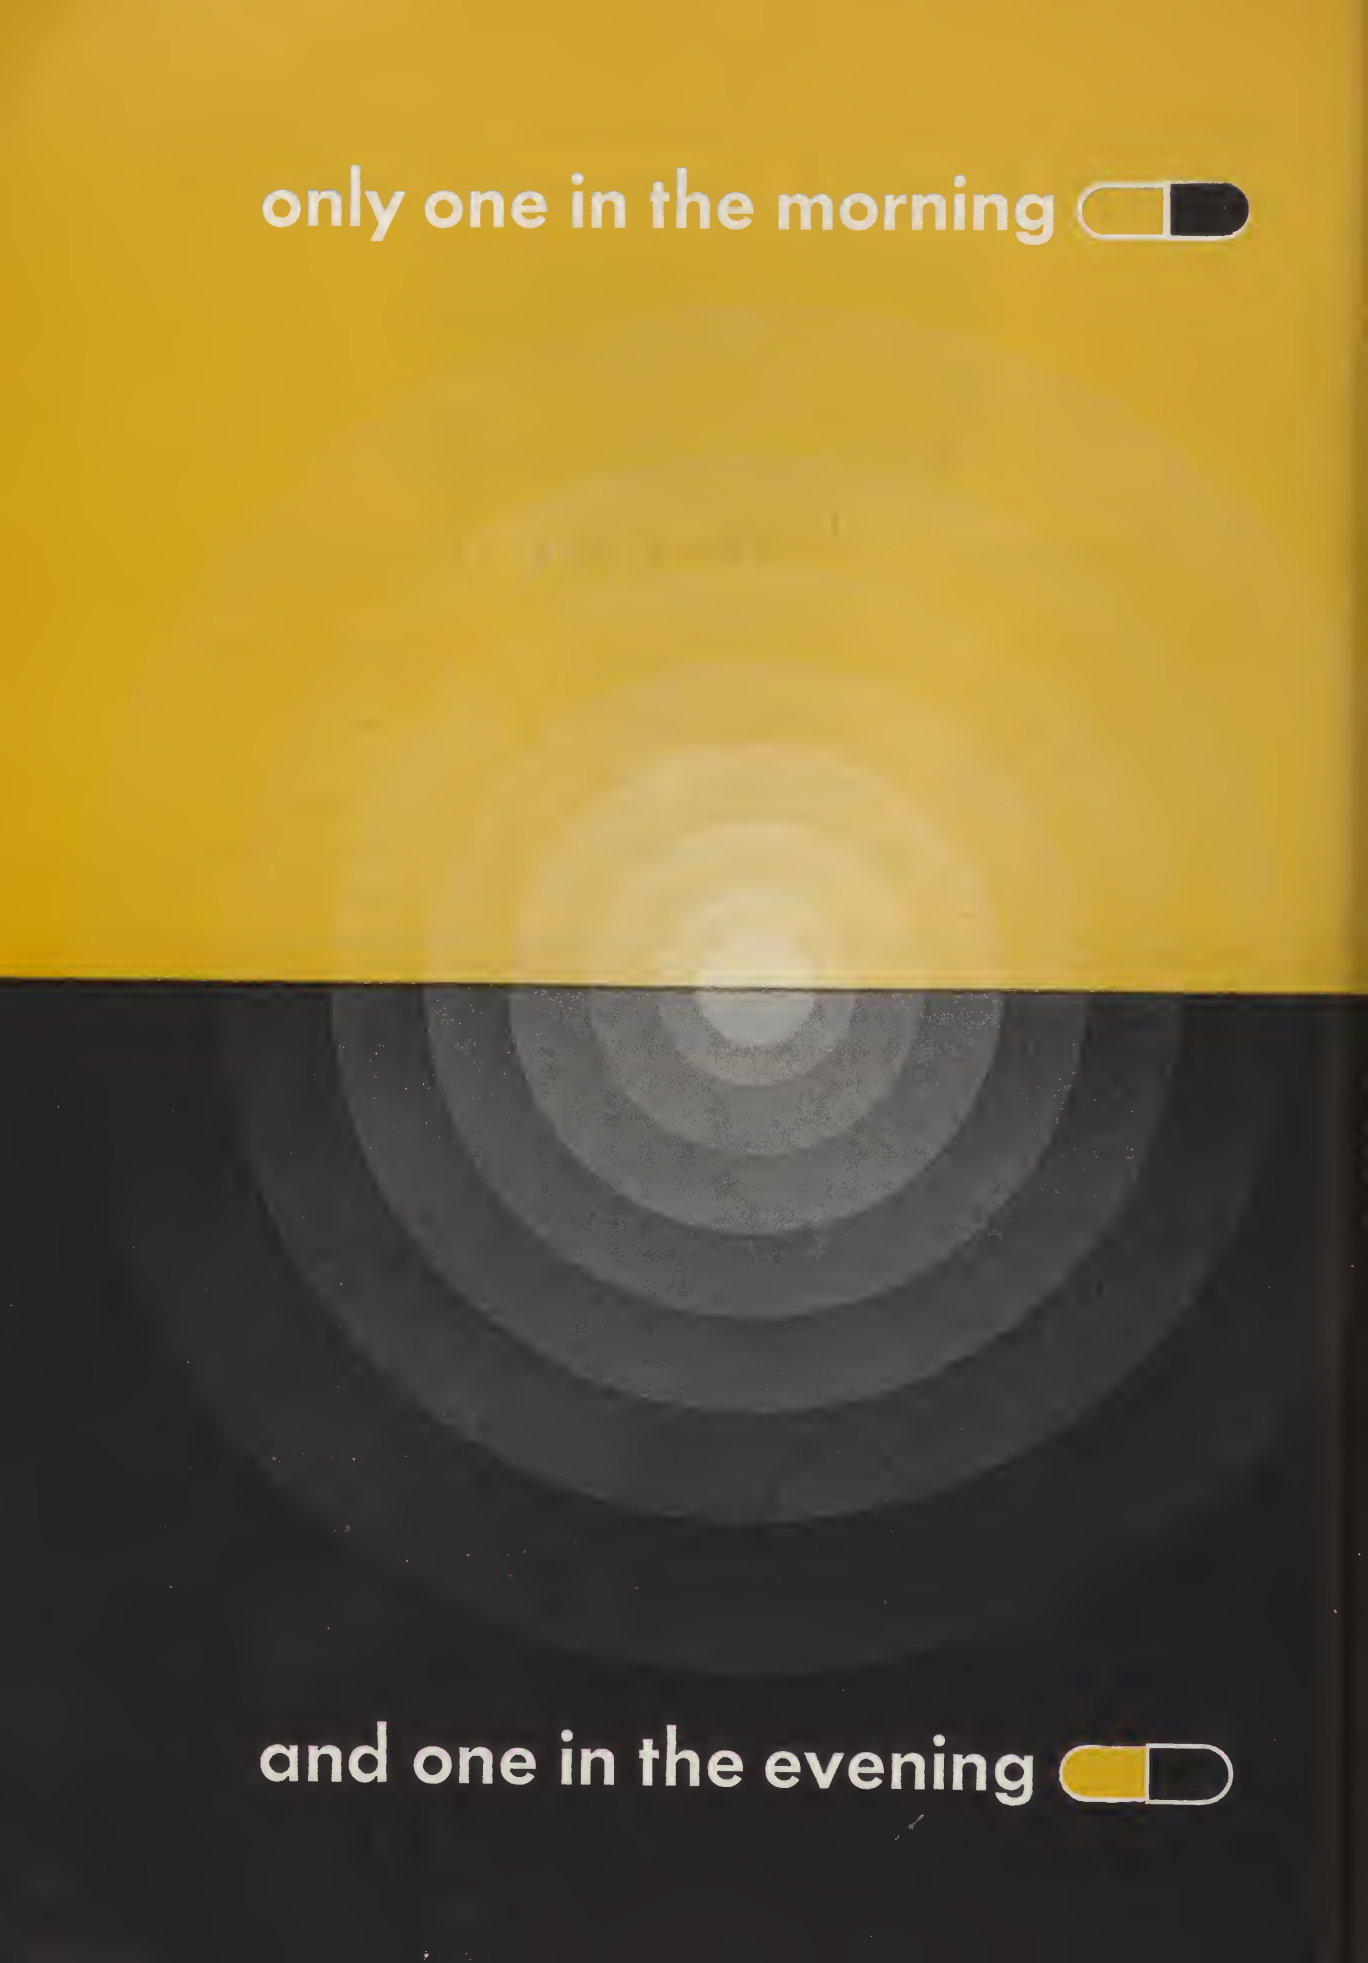
both normal tissue tolerance and tumor destruction. Radium therapy can be used occasionally to supplement external beam radiotherapy if higher local dosage is required.

The tumor destructive dose for lymphosarcoma or reticulum cell sarcoma is of the order of 3,000 rads in three to four weeks, including the node bearing areas of the neck and possibly the upper mediastinum in the treatment fields. For lymphoepithelioma, 4,000 to 5,000 rads in four to five weeks will be required. Squamous cell carcinoma, being still more resistant, necessitates more localized treatment and higher dosage in the range of 5,000 to 6,000 rads in five to six weeks.

Involvement of the base of the skull and cervical lymph node metastases are unfavorable prognostic signs; such cases are seldom cured. Incurable disease may be effectively relieved and restrained by radiotherapy in dosage designed to shrink the tumor mass without producing significant normal tissue reaction. If the primary nasopharyngeal lesion has been controlled for a period of four to six months, surgical excision of recurrent or persistent neck nodes may be done with a slight chance of cure.

STAGE OF DISEASE CORRELATED WITH FIVE-YEAR SURVIVAL RATES[5]



Stage	5-year Survival Rate
I	50%
II	40%
III	16%
IV	Incurable

Survival figures correlated with the stage of disease are presented in the Table.

and one in the evening

Now b.i.d. convenience plus even greater patient savings over q.i.d. tetracycline therapy

(plus all the advantages of tetracycline phosphate complex)

new Tetrex bidCAPS™*

(tetracycline phosphate complex)

Maximum patient savings. New bidCAPS now enable you to prescribe tetracycline in an even more economical, more convenient form. Your patient's prescription dollar gets maximum value: a daily bidCAPS dose is priced lower than any other leading brand of tetracycline—b.i.d. or q.i.d.

Well tolerated. Tetrex (tetracycline phosphate complex) is well tolerated. Gastrointestinal side effects are few; photodynamic reactions are extremely rare.

More of the active antibiotic in the blood. The basic tetracycline in Tetrex (tetracycline phosphate complex) is less bound to serum protein than is demethylchlortetracycline.[1] Result: Tetrex (tetracycline phosphate complex) provides a higher percentage of active antibiotic in the blood.

Available in bottles of 16 and 50.

BRISTOL

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms. *Contraindications:* The drug is contraindicated in individuals hypersensitive to tetracycline. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Mycotic or bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis and allergic reactions may occur. *Usual Adult Dose:* 500 mg. b.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.

now...specific therapy for night leg cramps

QUINAMM™

Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose . . . helps restore restful sleep.

QUINAMM Prescribing Information: Composition: Each white, beveled, compressed tablet contains: Quinine Sulfate 4 grains (250 mg.) and Aminophylline 3 grains (200 mg.). **Precautions:** Aminophylline may produce intestinal cramps in some instances, and quinine may produce symptoms of cinchonism, such as tinnitus, dizziness, and gastrointestinal disturbance. Discontinue use if ringing in the ears, deafness, skin rash, or visual disturbances occur. **Contraindication:** QUINAMM is contraindicated in pregnancy because of its quinine content. **Dosage:** One tablet upon retiring. Where necessary, dosage may be increased to one tablet following the evening meal and one tablet upon retiring. **Supplied:** Bottles of 100 and 500 tablets. **Caution:** Federal law prohibits dispensing without prescription.

ARRHYTHMIAS SECONDARY TO CRANIOCEREBRAL TRAUMA.

Review of the literature and report of a case

E. G. ELIAS, MD
Resident surgeon, Union Memorial Hospital

WILLIAM FINNEY, MD
Neurosurgeon, Union Memorial Hospital

Cardiovascular changes may take place secondary to intracranial damage.[1–12] These cardiovascular changes differ from the electrocardiographic changes seen with high blood pressure and slow pulse. The ECG changes also vary from tachycardia, auricular fibrillation, bradycardia, to changes in the QT complex.[4]

The source of intracranial damage may be either spontaneous such as intracerebral hemorrhage, or traumatic; ie, concussion, hemorrhage, or occurring during pneumoencephalography[6] and brain surgery.[13]

The route of the cerebrocardiac syndrome has been traced by stimulating different areas in the brain electrically or mechanically or by blocking the vagi chemically, producing various responses.

Cushing[7] was one of the first to describe slow pulse and increased blood pressure secondary to increased intracranial pressure. Walker[8] demonstrated immediate slow pulse after cerebral concussion, which could be prevented by sectioning of the vagi.

Jacobson and Danufsky[4] showed that abnormalities of cardiac function can be produced by cranial trauma in mice. These changes occurred immediately after trauma, suggesting that they are due not to increased intracranial pressure but to impulses through nerve fibers of the cholinergic group, probably by those of the vagus, which disappeared by injection of atropine.

Increased amplitude of T and RS waves during brain surgery has been reported, as well as prolongation of the Q-T segment in intracerebral hemorrhage and high intracranial pressure.[5]

Ventricular tachycardia has been reported following head trauma[9] and associated with internal hydrocephalus.[10] Abnormalities of cardiac rate and rhythm are common in bulbar poliomyelitis.

White[11] found that electrical stimulation of the lateral wall of the third ventricle induced tachycardia and that mechanical stimulation of the optic chiasma induced bradycardia, premature systoles, nausea, vomiting, and increased peristalsis. This would not occur if the patient had previously received atropine.

Beatie et al[12] produced ventricular premature systoles by stimulating the hypothalamus. Others reported, in addition, the production of sinus tachycardia and prolonged conduction time.

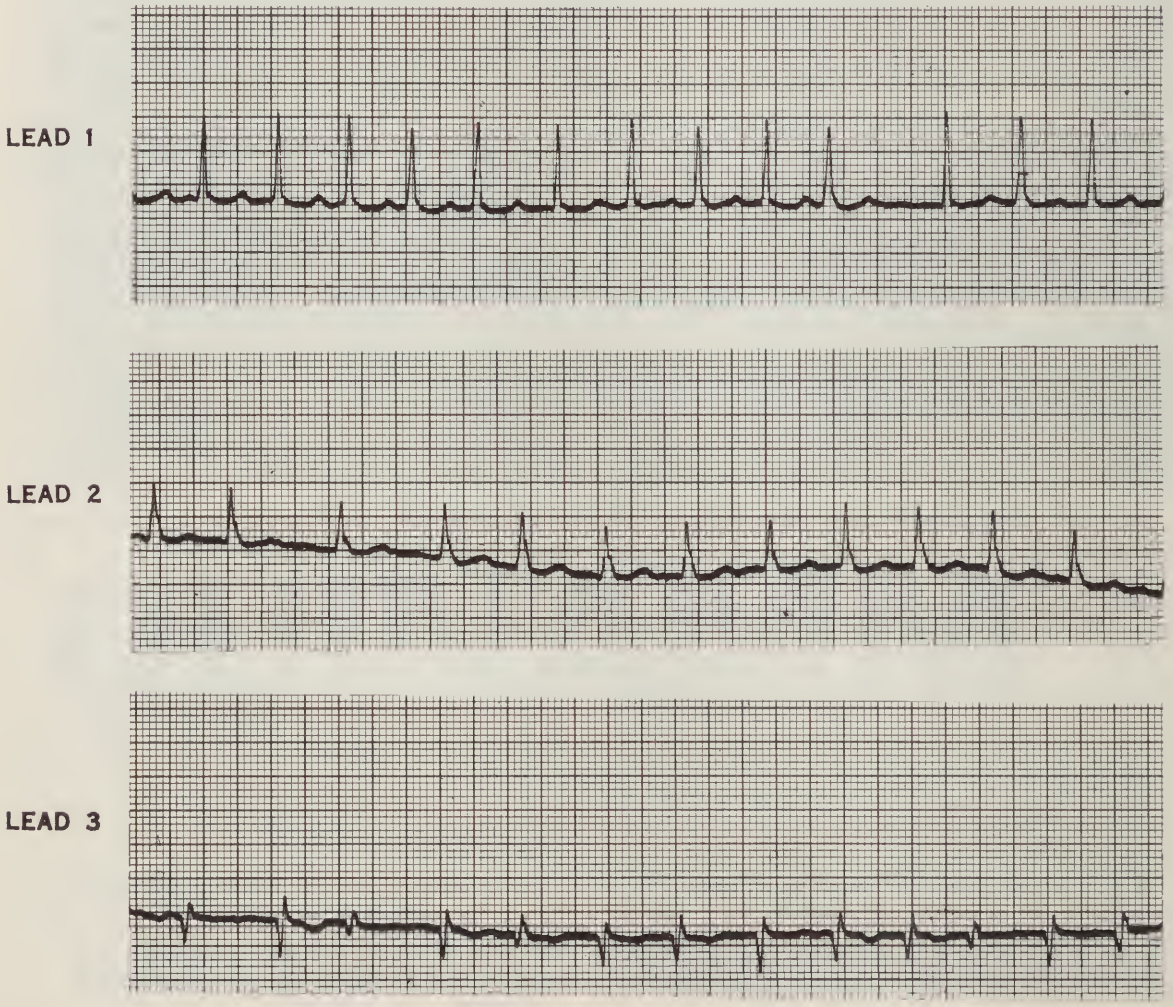
Abeles and Schneider[6] reported that pneumoencephalography may produce ECG changes compatible with stimulation of the pacemaker through the vagus. These changes include sinus arrhythmia, sinus bradycardia, sinus tachycardia, migration of pacemaker between S-A and A-V nodes, transitory nodal rhythm.

The case we are to present suggests that subdural hemorrhage and increased intracranial pressure can manifest themselves clearly by arrhythmias.

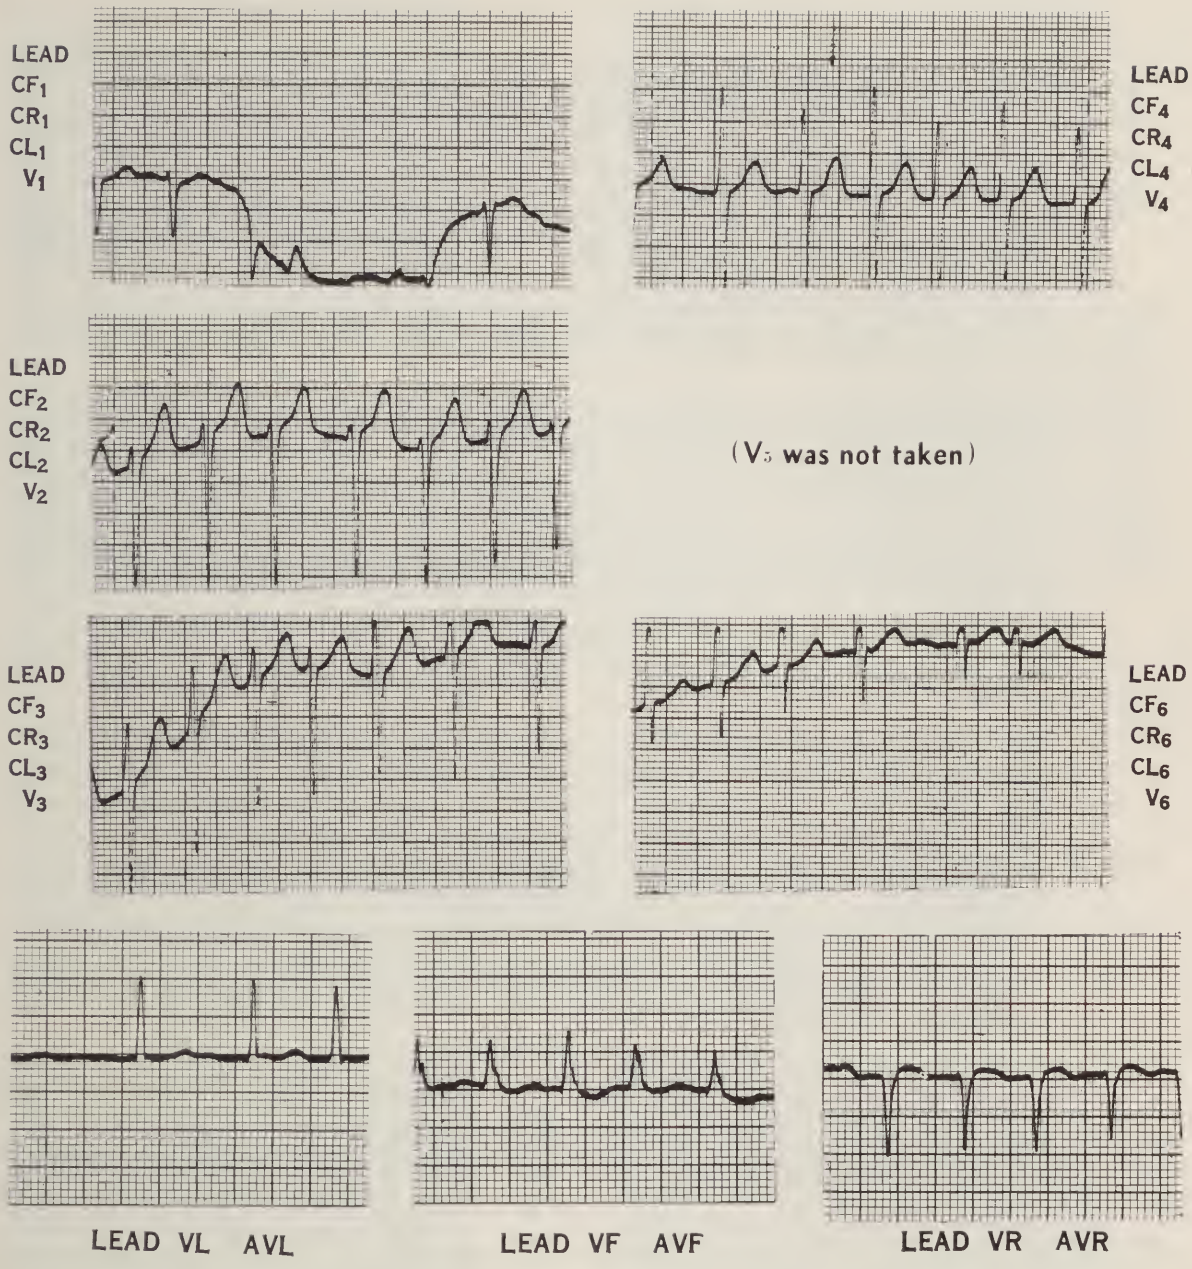
Case Report

A 62-year-old white man was admitted to the Union Memorial Hospital, because of unconsciousness after a fall down 15 steps. There was no history of syncope or dizziness. He had, however, been seen in the outpatient departments of other hospitals because of nonspecific abdominal complaints and headaches. There was no history of cardiac disorders.

The patient had consumed alcoholic beverages before his fall.



On admission, he was stuporous but arousable and would follow simple commands. There were no localizing neurologic signs nor bleeding from ears, nose, or throat. The patient was believed to be inebriated, and he was placed under observation.

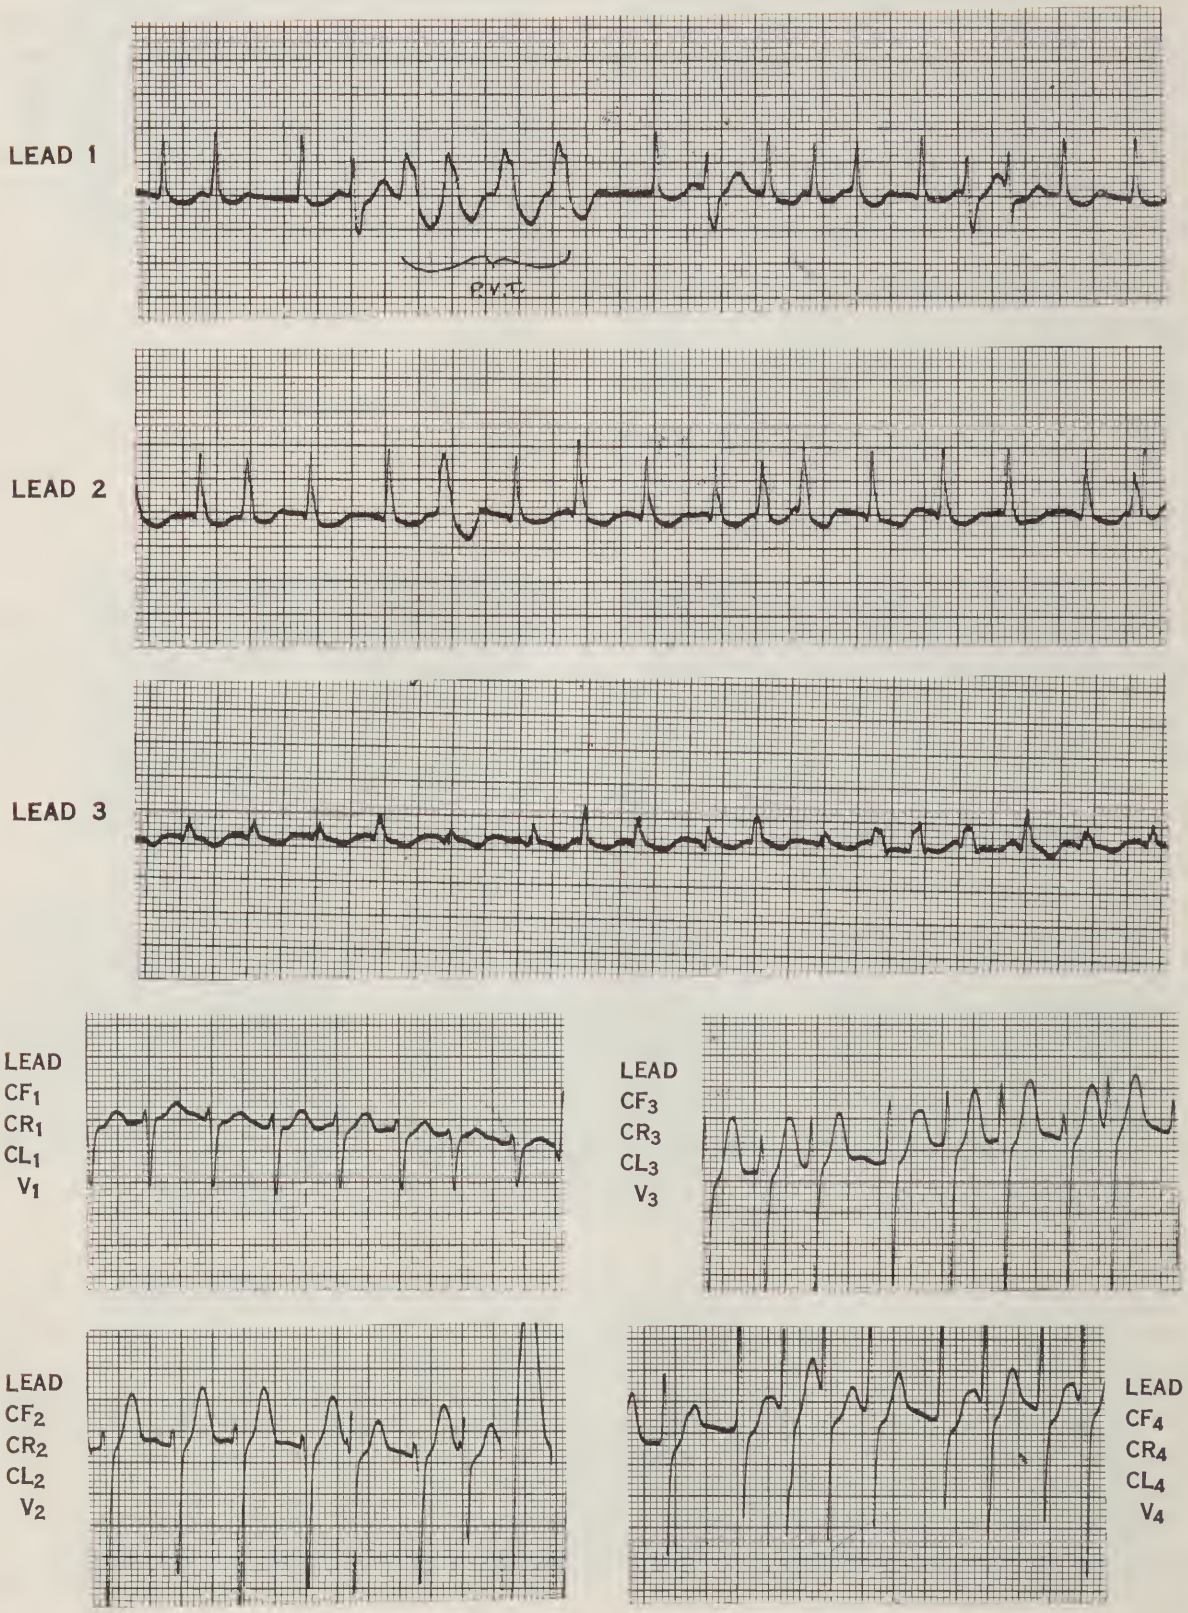


Physical findings on admission were: pulse, 80 and irregular blood pressure, 180/110; respirations, 20; temperature, 97.6. Other physical findings were negative except for abrasions on the right anterior chest wall. X-ray of the skull showed a linear fracture of the left temporal bone. The pineal gland was calcified midline.

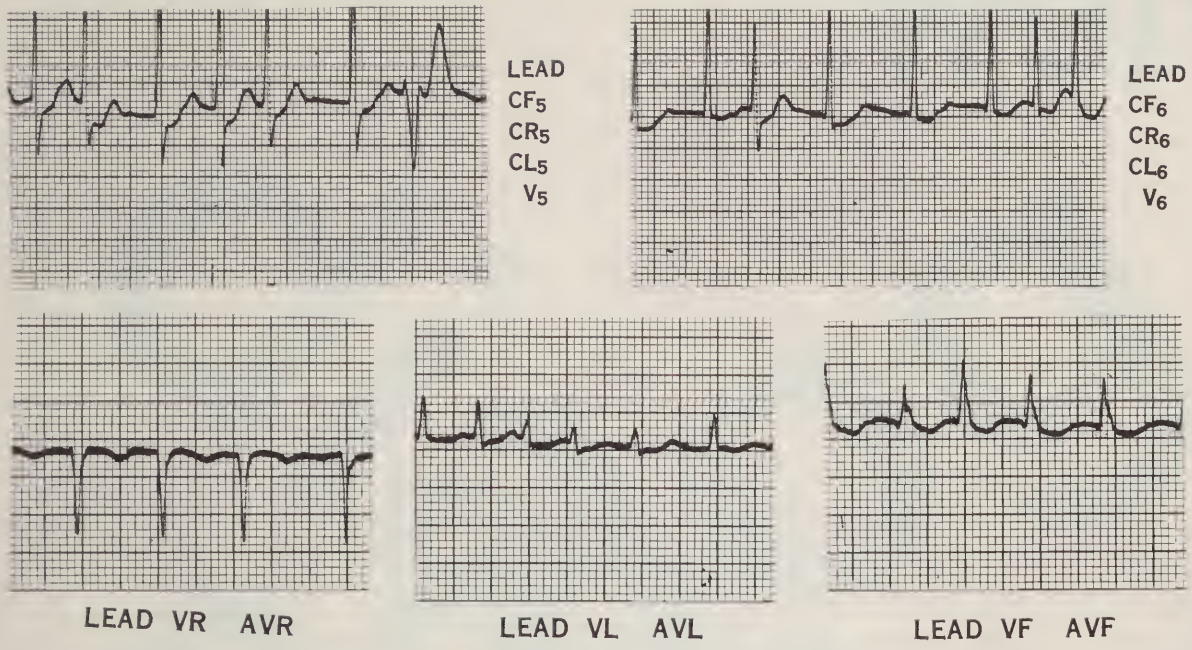
The patient was kept under close observation. Twelve hours later his neurologic condition was unchanged, although the patient developed irregular pulse (irregular irregularity). ECG showed auricular fibrillation with ventricular response of 130+/min (Fig 1).

At that time lanatoside C (Cedilanid) and digitoxin were administered. Blood pressure was 160/100; rectal temperature, 102; lumbar puncture was done with opening pressure of 290 mm

Fig 1



H_2O (patient flat), and the cerebrospinal fluid was xanthochromic with red blood cell count of 5,643/cu. mm.



Up to that time, the presumed diagnosis was stroke or subarachnoid hemorrhage. The visascope was connected to the patient. He received repeated doses of lanatoside C until full digitalization 1.6 gm was attained, but there was no change in cardiac rate.

Six hours later, 1 gm of procainamide hydrochloride (Pronestyl) was given intravenously. One hour later there was still no response. The ECG showed ventricular tachycardia and frequent systoles with aberrant conduction and occasional PVC, as well as ST, changes of myocardial ischemia (Fig 2).

At that time the pupils were still equal and reacted to light. There was no papilledema or pathologic reflexes. The only new neurologic

finding was a right central VII paresis. Blood pressure was 176/90; pulse 140-160/min.

The patient was slipping into deeper coma and was not responding to painful stimuli. He was taken to the operating room, with the visascope connected (Fig 3A). Bilateral subtemporal burr holes were placed and bilateral subdural hematomata evacuated. After the second trephine was

new

"Doctor, when the kids act up and nothing goes right, I get these throbbing pains in the back of my head."

a new formulation that relieves pain in tension headache and neuralgia

Dialog is a combination of 15 mg allobarbital and 300 mg acetaminophen. Allobarbital, a proven barbiturate, provides desirable sedation in patients experiencing pain and discomfort. Acetaminophen is a nonsalicylate analgesic-antipyretic, well tolerated and useful in a wide range of mildly painful and febrile conditions.

Dialog is well tolerated, even by those sensitive to aspirin. It is nonirritating to the gastrointestinal tract and has no adverse effects on the kidneys.

- Raises the pain threshold
- Suppresses the pain-producing mechanism
- Reduces emotional tension

2/3453MK–2

Dialog™

(allobarbital and acetaminophen CIBA)

Indications: For relief of pain and discomfort of simple headache; neuralgia, myalgia, and musculoskeletal pain; dysmenorrhea; bursitis; sinusitis; fibrositis. Also indicated to reduce fever and to relieve discomfort due to respiratory infections, influenza, and other febrile conditions.

Contraindication: Not recommended during pregnancy.

Caution: May be habit-forming. Do not use in patients sensitive to barbiturates or in those with moderate to severe hepatic disease.

Side Effects: Nausea, transitory dizziness, rash. Overdosage of allobarbital produces symptoms typical of acute barbiturate excess.

Dosage: *Adults:* 1 or 2 tablets every 4 hours. Not to exceed 8 tablets in 24 hours. *Children 6 to 12:* ½ to 1 tablet every 4 hours. Not to exceed 4 tablets in 24 hours.

Supplied: *Tablets* (white, scored), each containing 15 mg allobarbital and 300 mg acetaminophen; units of 3 bottles of 30.

For your convenience—prescription-size bottle of 30.

CIBA Pharmaceutical Company, Summit, N.J.

arrest diarrhea

LOMOTIL®

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . . 2.5 mg.
(Warning: May be habit forming)
atropine sulfate . . . . . 0.025 mg.

Effectiveness: Lomotil possesses a unique degree of effectiveness in both acute and chronic diarrhea.

Convenience: Lomotil is supplied as small, easily carried, easily swallowed tablets and as a pleasant, fruit-flavored liquid.

Versatility: The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or as adjunctive therapy in diarrhea associated with:

- **Ulcerative colitis**
- **Acute infections**
- **Irritable bowel**
- **Regional enteritis**
- **Drug therapy**
- **Food Poisoning**
- **Functional hypermotility**
- **Malabsorption syndrome**
- **Ileostomy**
- **Gastroenteritis and colitis**

Dosage: For correct therapeutic effect—Rx correct therapeutic dosage. The recommended initial daily dosages, given in divided doses, until diarrhea is controlled, are:

Children: Age	Total Daily Lomotil Dosage	Lomotil Liquid Dosage (Each teaspoonful [4 cc.] contains 2 mg. of diphenoxylate HCl)
3-6 months	3 mg.	½ tsp. 3 times daily
6-12 months	4 mg.	½ tsp. 4 times daily
1-2 years	5 mg.	½ tsp. 5 times daily
2-5 years	6 mg.	1 tsp. 3 times daily
5-8 years	8 mg.	1 tsp. 4 times daily
8-12 years	10 mg.	1 tsp. 5 times daily

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily) Based on 4 cc. per teaspoonful. Maintenance dosage may be as low as one-fourth the initial daily dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

Everyone says she's a barrel of fun

But what does she think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextra-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneuratics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

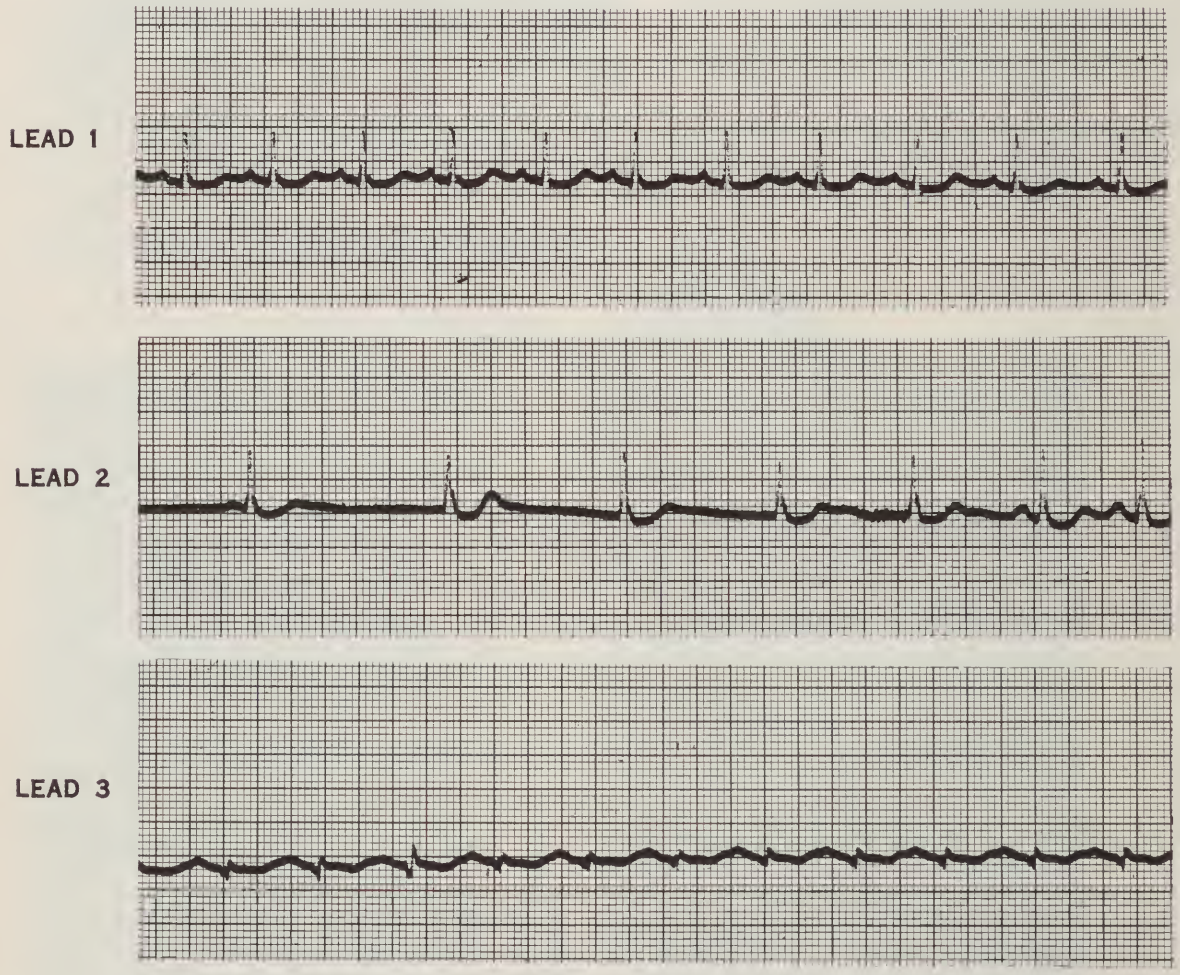
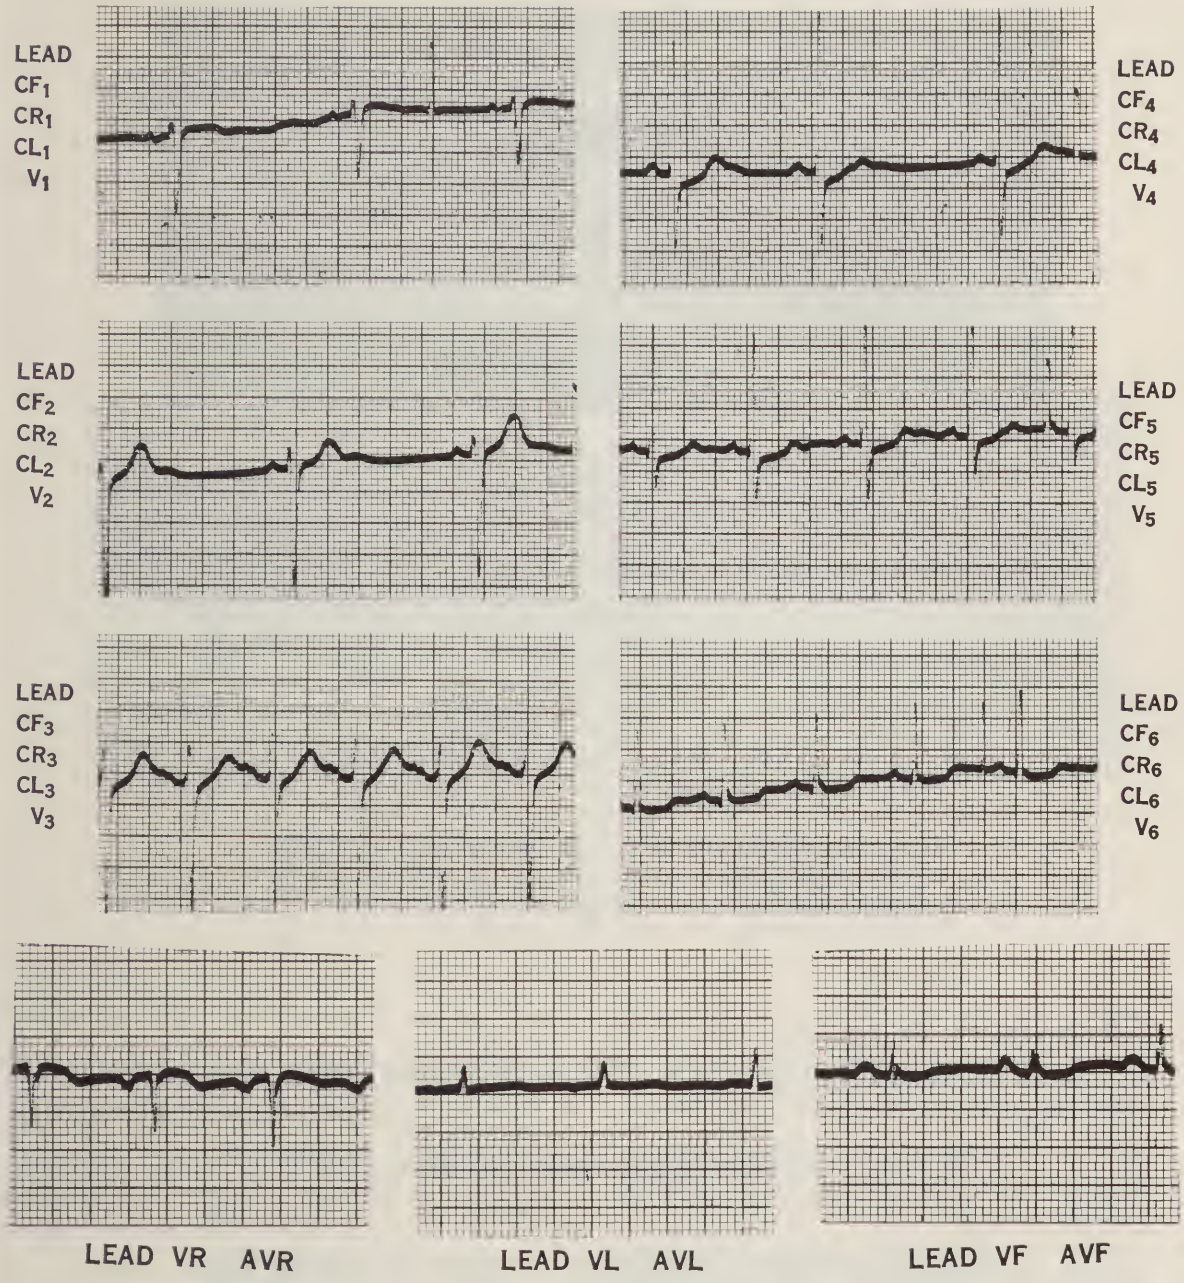
695-6

made (on the left) the left side of the brain partially decompressed, the ECG and pulse reverted to normal (Fig 3B).

During surgery, the brain re-expanded rapidly, filling the space where the subdural hematomata had been evacuated.



Digoxin, 0.5 mgm daily, was maintained postoperatively. The patient became more responsive and moved all extremities. The pulse rate was 80-100/min and regular for eight hours after surgery. It then became irregular. Figure 4 shows the postoperative electrocardiographic findings. Mercaptomerin sodium (Thiomerin) and mannitol improved the urinary output. The intravenous fluids were restricted to a minimum. Twenty hours after surgery the temperature rose to 103 rectally, and hypothermia was instituted.



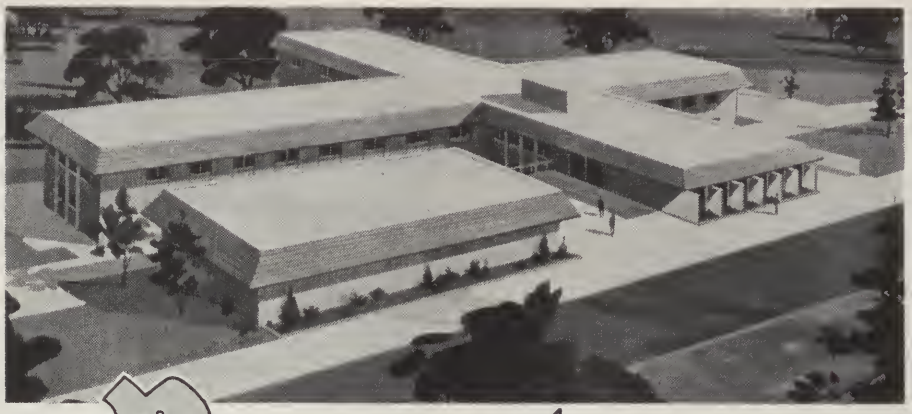
Electrolytes remained normal: BUN, 20%; SGOT, 25 units/ml; Hct, 45%, WBC, 13,900/cu mm. The patient regressed slowly into deep coma. Forty-eight hours after operation, there was definite spasticity of the left side. Cerebral needling through the right parieto-occipital burr hole evacuated 5 ml of blood. The patient continued to deteriorate with labored breathing. He died on the seventh day of hospitalization.

At autopsy were found the remnants of the subdural hematoma, subarachnoid hemorrhage, and a fresh intracerebral hematoma that measured 6-7 x 3-4 cm in the white matter of the right central and parietal lobe, extending from the cortex to the lateral angle of the sella media of the right lateral ventricle at the level of the lateral geniculate body. The brain was edematous and weighed 1650 gm. There was no compression of the midbrain.

The coronary arteries showed atherosclerosis with pinpoint lumen. The heart was enlarged and

Fig 4

weighed 500 gm. There was no evidence of recent or old myocardial infarction. The liver showed acute congestion and fatty metamorphosis.



Conclusion

From review of the literature and from observations made on this patient, it would seem that cardiac arrhythmias may result from rapid increase in intracranial pressure rather than from specific brain damage. Subdural hematoma is presented in this case report as a specific cause of cardiac arrhythmia.

A good way to describe 'Stelazine'. It's different from the tranquilizers that sedate and dull your anxious patients. Its antianxiety effect is direct. On 'Stelazine', your patients can be calmed yet remain alert.

And 'Stelazine' offers additional benefits. Dependence has not been reported. At low doses, side effects are minimal. Its b.i.d. dosage is convenient and economical.

Stelazine®

brand of **trifluoperazine**

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. *Contraindications:* Comatose or greatly depressed states due to C.N.S. depressants and in cases of existing blood dyscrasias, bone marrow depression and liver damage. *Precautions:* Use with caution in angina patients and in patients with impaired cardiovascular systems. Antiemetic effect may mask symptoms of other disorders. An additive depressant effect is possible when used with other C.N.S. depressants. Prolonged administration of high doses may result in accumulative effects with severe C.N.S. or vasomotor symptoms. Use in pregnant patients only when necessary for the patient's welfare. *Side Effects:* Occasional cases of mild drowsiness, dizziness, mild skin reactions, dry mouth, insomnia and amenorrhea. Neuromuscular (extrapyramidal) reactions (motor restlessness, dystonias, pseudo-parkinsonism) may occur and, in rare instances, may persist. In addition, muscular weakness, anorexia, rash, lactation, hypotension, and blurred vision have been observed. Blood dyscrasias and cholestatic jaundice have been extremely rare.

For a comprehensive presentation of 'Stelazine' prescribing information and side effects reported with phenothiazine derivatives, please refer to SK&F literature or *PDR*.

Smith Kline & French Laboratories, Philadelphia SK&F

SURGICAL REHABILITATION AFTER RADICAL MAXILLECTOMY AND ORBITAL EXENTERATION

JOHN E. HOOPES, MD
MILTON T. EDGERTON, MD

The extent to which an ablative technique reasonably may be applied depends upon the degree to which satisfactory function and acceptable appearance may be restored. Interference with function or alteration of appearance to a point that would preclude the patient's right to pursue a useful, meaningful existence violates the basic tenets of medicine. Reconstructive techniques have been highly refined, yet inadequate advantage has been taken of modern surgical methods to provide optimal management for patients with cancer of the head and neck.

Resection of the maxilla is a well established technique in the management of caner. In its limited form, the resection introduces relatively minor problems in reconstruction. When combined with more extensive resections, which require considerable sacrifice of soft tissue and the orbital contents, few procedures produce more devastating functional impairment or more grotesque deformity.

Five major areas of reconstruction must be dealth with. The goals are: 1) to obtain a healed wound, 2) to restore palatal competence, 3) to support the orbital contents, 4) to restore facial contour, and 5) to obliterate the facial defeat.

Initially, maxillary resection was associated with high morbidity. The large areas of exposed muscle and bone contaminated by oral secretions gave rise to repeated postoperative hemorrhages. Profuse drainage required meticulous nursing care with careful attention to frequent wound packing. Discomfort was considerable and prolonged, and marked deformity resulted from contracture and displacement of soft tissues.

Application of a skin graft to denuded areas provides the most expedient means of obtaining a clean, healed wound. The concept of immediate replacement of lining is a major advance toward reconstruction after maxillectomy. The skin graft is placed on the buccal surface of the cheek flap and sutured to the remaining mucosa with fine catgut. The entire pterygoid fossa and the undersurface of the globe, if necessary, are covered so

From the Division of Plastic Surgery, The Johns Hopkins Hospital and School of Medicine.

Refinements in reconstructive techniques allow a more thorough surgical approach to tumor extirpation by assuring satisfactory functional and cosmetic rehabilitation. Operative rather than prosthetic management of palatal defects is preferred and should precede closure of an orbitofacial defect. Forehead and cervical areas provide ideal pedicle flap tissue in terms of accessibility, rapidity of transfer, and quality of material.

as to leave no granulating surface other than the resection margin on the palate. The cavity is packed firmly with iodoform gauze saturated with balsam of Peru, care being taken to apply pressure and overcorrect the cheek. The packing is removed on the seventh postoperative day, and a temporary dental prosthesis is used to support a lighter pack for an additional week. The patient is comfortable throughout convalescence; healing is prompt and uncomplicated, allowing early toleration of a prosthesis; and deformity is minimal. This refinement overcame many of the problems associated with maxillectomy but left unresolved management of the palatal fistula and restoration of facial contour.

The functional disability caused by loss of the palate is tremendous, and restoration of palatal competence is mandatory. Having experience with both prosthetic and surgical closure we are convinced that repair with living tissue offers unequalled results in terms of comfort, speech, hygiene, and eating. Patients who have experienced both methods of management uniformly report surgical repair to be the more satisfactory. The impetus for repair has come from patients dissatisfied with prostheses.

Dental prostheses have a number of disadvantages: 1) there is difficulty in obtaining an adequate leak-tight seal without irritation; 2) retention is virtually impossible without adequate dentition; 3) the prosthesis impinges on mobile structures and gag areas; 4) frequent necessary replacement is prohibitively expensive; 5) all patients complain of discomfort, continued difficulty with speech, problems of oral hygiene, and a deep sense of personal deformity associated with daily care and wearing of the prosthesis.

Objections to surgical repair are proposed in terms of age of the patient, time and expense involved in staged procedures, creation of secondary deformity, and technical problems encountered in intra-oral wound healing. It is the elderly, edentulous patient who rarely obtains an acceptable result with a prosthesis. The magnitude of the palatal defect resulting from extensive resections prevents retention of any ordinary prosthesis. With proper planning, most of the reconstructive procedures can be performed under local anesthesia; brief periods of hospitalization are required for each procedure; and negligible secondary deformity is produced. The period of reconstruction is brief when compared to a lifelong commitment to an obturator. Much reluctance to pursue surgical rehabilitation stems from unfamiliarity with reconstructive techniques.

Local tissues in the form of palatal or buccal mucosal flaps are used to repair limited palatal fistulas. For larger defects, a generous cervical tube pedicle flap is most satisfactory. The reconstructed palate must be airtight. It must have adequate rigidity without excessive bulk. Two non-hair-bearing lining surfaces must be provided, and it must not interfere with the wearing of a denture. Cervical tissue satisfies these qualifications admirably.

The dimensions of the flap depend upon the location and size of the palatal defect. The flap is outlined transversely within the natural skin lines with the permanent pedicle located slightly below the angle of the mandible on the side of the defect. The donor area usually may be closed primarily but is grafted if necessary (Fig 1). Delay of the distal pedicle three weeks after the initial pro-

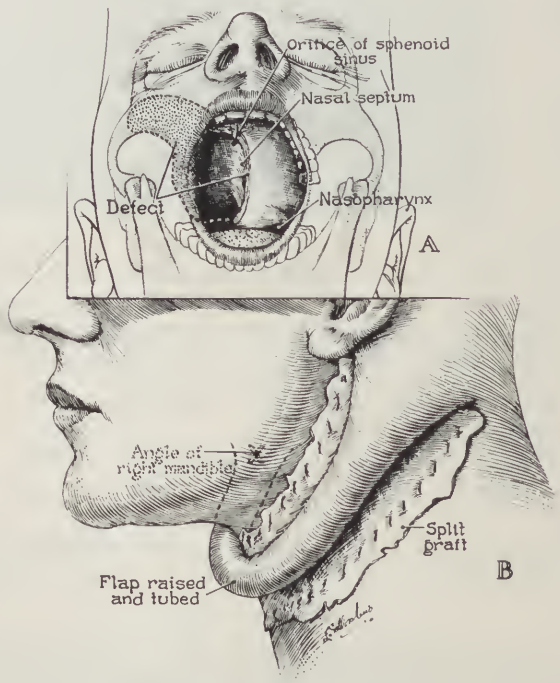

Fig 1

The usual deformity consists of a large palatal fistula and absence of bony support in the malar region. The bipedicle cervical flap is elevated within the natural skin lines and tubed. The donor area usually may be closed primarily.

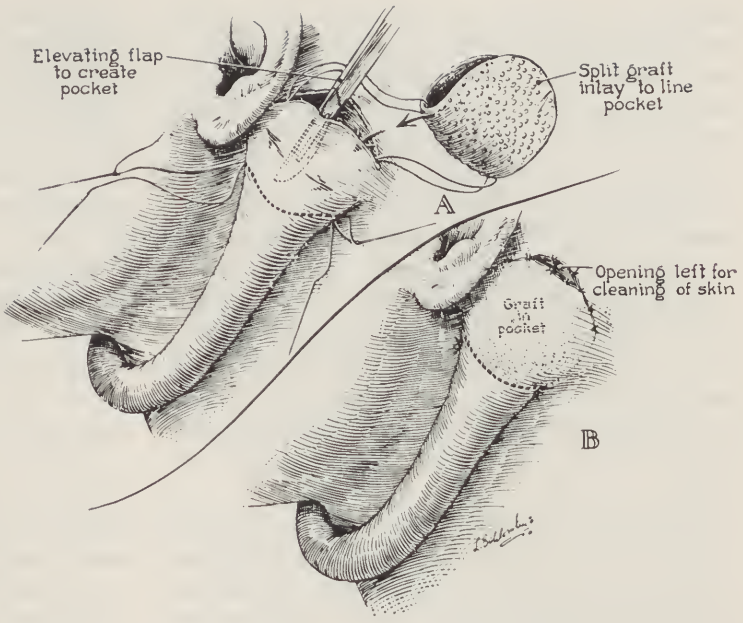

Fig 2

The distal pedicle is lined with a skin graft which will serve as nasal lining.

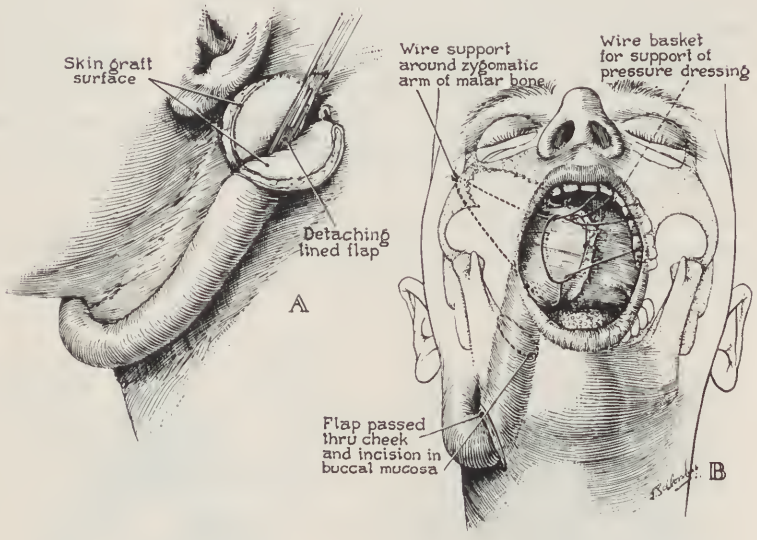

Fig 3

The distal pedicle is introduced into the buccal cavity through the submaxillary triangle on the medial aspect of the mandible and sutured into the palatal defect.

cedure consists of lining the pedicle with a skin graft which later serves as the nasal floor (Fig 2). The scar tissue incited by the grafting provides rigidity that is desirable in a reconstructed palate. Three weeks after delay, the distal pedicle is transferred into the mouth through the submaxillary triangle on the medial aspect of the mandible. Introduction of the flap through a submandibular incision avoids facial scarring and compromising the oral aperture. The recipient site for the flap is prepared by elevating mucoperiosteum, which is turned toward the margin of the defect, thus providing mucosal tissue for the attachment of the flap and increasing the area of attachment. The flap is contoured to the proper size and sutured into place in two layers (Fig 3). Proper support of the flap is essential. A wire basket is constructed within the superior alveolar arch and wired either to the teeth or directly to the alveolus. The basket permits packing to be inserted and held with moderate pressure against the implanted end of the flap. Nasal packing is

inserted above the flap. At the time of division of the pedicle, sufficient skin is preserved to create a sulcus between the reconstructed palate and the buccal mucosa. The total reconstruction is accomplished in four operative procedures over a period of eight to ten weeks. Complications in the form of infection and partial flap separation have occurred but never have been of sufficient magnitude to warrant abandoning the original plan.

Temporary use of a prosthesis is advisable if delayed reconstruction is planned. In this circumstance, preoperative dental consultation should be arranged for obtaining impressions and preparing existing teeth for retention of the prosthesis. Fewer than 5% of patients benefit by this approach.

Young patients tolerate reasonably well use of a flap from the medial aspect of the brachium. This method is preferred for palate reconstruction if cervical tissues are not available or if the defect is anteriorly and centrally located. Elderly patients may suffer permanent pain and disability in the upper extremity after immobilization.

Although the usual resection either retains the orbital floor or includes an orbital exenteration, occasionally the orbital floor is sacrificed but integrity of the orbital contents maintained. Binocular vision can be preserved only by providing adequate support for the globe. Immediate and permanent support may be provided either by a temporalis muscle-fascia flap transferred across the floor of the orbit to the medial margin of the bony resection or by a median forehead flap transposed inferior to the globe with the forehead skin directed into the antrum. Reconstitution of the orbital floor with a bone graft may be performed as a secondary, planned procedure if necessary.

Restoration of facial contour is as important as functional considerations and must be an integral step in rehabilitation. The method to be used is determined by the specific situation and the ingenuity of the surgeon. If a cervical flap has been employed to reconstitute the palate, the unused portion of the flap provides excellent contour material. The epithelium is carefully removed and the fat flap transposed subcutaneously into the area of the malar prominence (Fig 4). Dermis-fat grafts are suitable, but resorption occurs to a greater degree and they are less predictable than grafts with pedicled fat. The new synthetic materials appear promising for use in this area of reconstruction. Dental prostheses can be modeled to support the cheek and orbital contents.

Combined palatofacial defects extending from the brow to the lip, from the zygomatic arch to the midline of the nose, and looking directly down on the tongue and pharynx pose complex restorative problems. In our initial experience with such patients, obliteration of the orbitofacial defect was assumed to be the major surgical need, and a dental prosthesis was used for the palatal defect. Definitive reconstruction demands flap coverage. Tis-

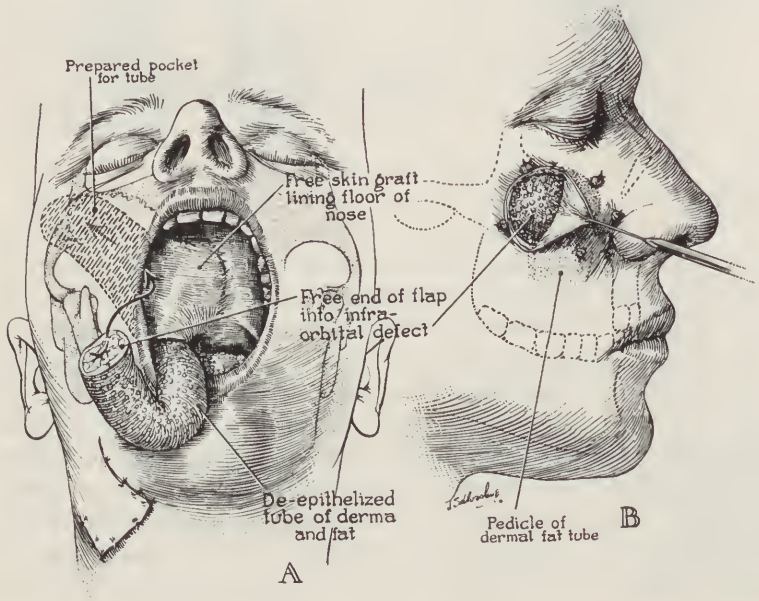

Fig 4

The denuded, excess portion of the cervical flap provides ideal contour material for correction of the cheek deformity.

sue pedicled about the head and neck has proved more satisfactory than distant tissues, and we have tended to rely on the scalp or cervicothoracic region for donor material. Preparation of these flaps includes application of a skin graft lining which will be sutured to the mucosal margins of the defect. Even though the wounds are massive and topographically complex, it often is possible and practical to obtain a healed wound by careful application of a skin graft, thereby allowing somewhat more deliberation in securing pedicle flap coverage.

It is surprising that most patients are content to disguise the residual deformity with either a frosted lens or a black patch. An occasional patient will benefit from the excellent facial prostheses now available.

Experience has shown that restoration of palatal competence is of primary importance and should precede obliteration of the orbitofacial defect. On this basis, we have sought methods of accomplishing repair in both areas with a minimal number of procedures.

The hinged nasal septum flap provides an expedient means of reconstituting the palate. After resection, the margins of the palatal defect are permitted to heal completely so that adequate mucosal circulation is reestablished on the side of the defect. Three to four weeks after resection, the cheek incision is reopened to provide access to the nasal septum and palatal defect. The palatal defect is reproduced on the septum with the base of the flap on the vomer. The entire thickness of the septum is incised down to the junction of the septum with the remnant palate. The septal flap is bent over to the side of the defect until the cartilage dislocates from its nasal crest articulation and the vomer fractures in its caudal portion. Appropriate mucosal flaps are elevated about the perimeter of the palatal defect to receive the margin of the septal flap so that a double-layered closure can be accomplished (Fig 5). The procedure has the obvious advantages of being accomplished in one stage and of providing a thin, rigid palate. It has become our procedure of choice for restoration of hemipalatal defects. A lined forehead flap to the orbitofacial defect completes the reconstruction. We have encountered no functional problems referable to loss of the nasal partition.

The total forehead flap lined with a skin graft may be used for total reconstruction. In terms of color, lack of hair, accessibility, and texture and body which give it supporting quality, the forehead flap provides an ideal tissue for this purpose. In view of the almost perfect color match provided

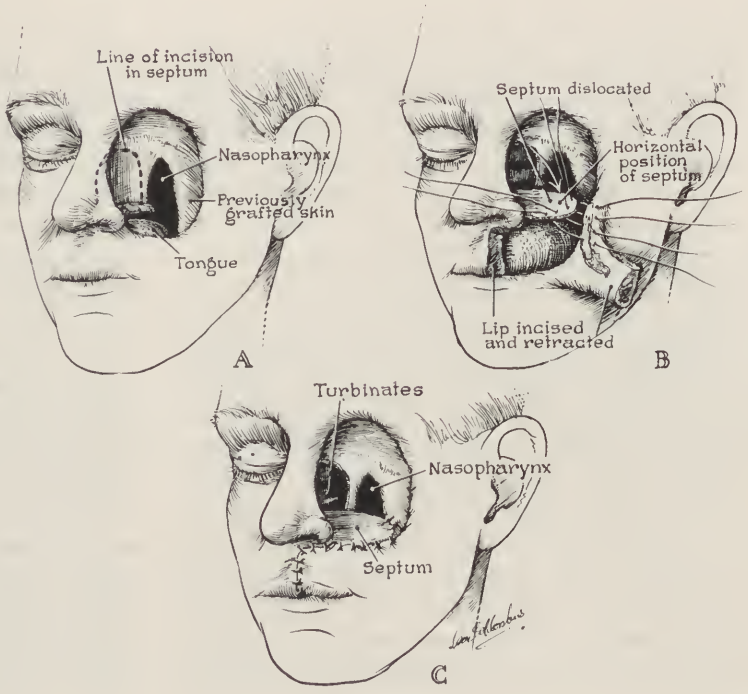

Fig 5

The hinged nasal septum flap is the preferred method for restoration of hemi-palatal defects. Obliteration of the orbitofacial defect is accomplished with a lined forehead flap.

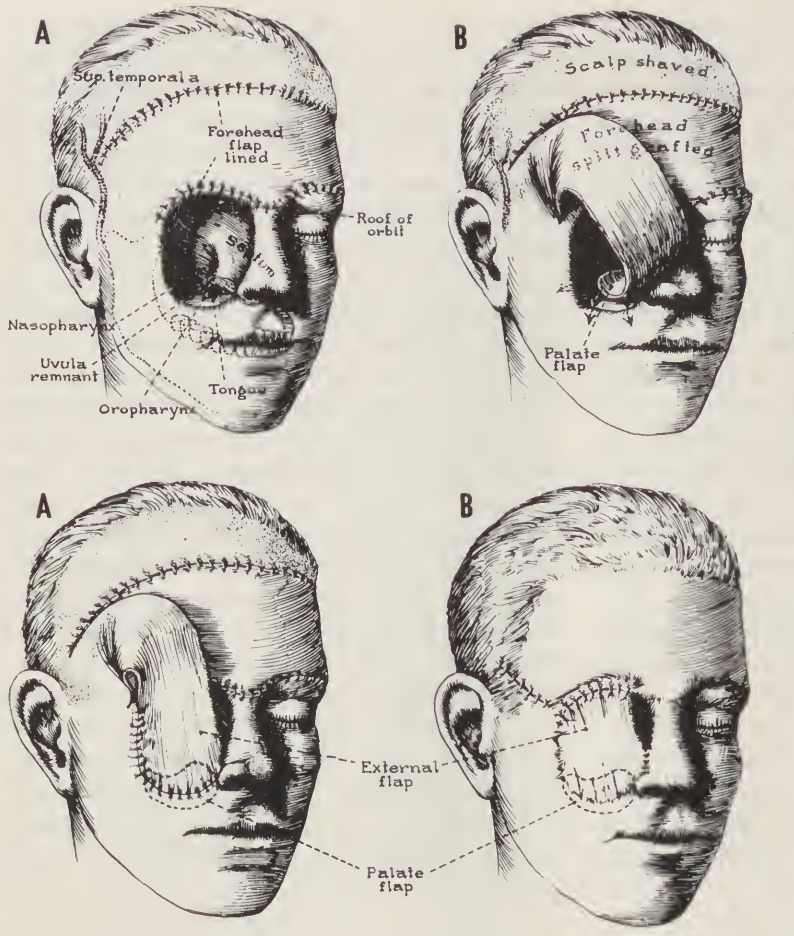

Fig 6

A total forehead flap based on the ipsilateral temporal artery and lined with a skin graft provides an expedient method for restoring palatal competence and obliterating the orbitofacial defect.

by a skin graft obtained from the neck or clavicular area, we have no reservations about using the total forehead as flap donor tissue. A bipedicle flap of the forehead is elevated down to frontalis from ear to ear and from hairline to brow with preservation of both temporal arteries. The flap is lined with a skin graft and returned. Ten days later, the contralateral pedicle is divided on a line with the lateral canthus and the distal end of the flap passed through the orbitofacial defect and approximated to the margins of the palatal defect with the forehead skin directed orally. Suturing to the lip requires removal of a strip of forehead skin epithelium. The flap is supported with the wire basket described previously. The forehead is grafted with a split thickness graft from the neck or clavicular area. The skin graft is applied as a single unit extending from hairline to brow and from lateral canthus to lateral canthus. Three to five weeks later, the temporal pedicle is divided and the remaining flap used for partial or complete obliteration of the orbitofacial defect (Fig 6). Partial obliteration with preservation of a "window" for follow-up evaluation frequently is preferred to complete closure. The entire reconstruction requires only one additional procedure and three weeks longer than simple obliteration of the cheek defect.

The question of timing must be weighed carefully. Proponents of delayed reconstruction argue that the patient should not be submitted to a series of "needless" operations without assurance of cure and that reconstruction masks recurrence. What constitutes a reasonable period of observation is open to considerable question. Basal cell carcinoma and melanoma may recur many years after initial therapy. Although most epidermoid carcinomas which recur do so with in one year, even a three-year period free of disease is no guarantee of cure.

How long should a patient be made to endure

Make a memo anywhere!

New DeJUR Stenorette® Versatile® EN-3™

Miniature Electronic Diary

Valuable ideas and important insights flash into mind when you least expect them. Don't let them get lost in limbo. Jot 'em down in Versatile EN-3, the Pocket-Steno—the electronic diary that fits your hand, slips into your pocket.

DeJUR's EN-3 is no toy. This professional quality instrument is a magnificent example of modern electronic miniaturization. Precision built, easy-to-operate, totally dependable, 13 oz. lightweight. Carry EN-3 with you wherever you go.

TECHNICAL DETAILS: Single control thumb switch for recording, playback, fast rewind, off. Special off-position-lock. Snap-in mike is speaker too. Time saving, pre-loaded no-thread tape cartridge snaps into place easily. Tape erases automatically . . . can be reused some 10,000 times.

Stenorette® *Versatile*® EN-3™

Electronic Pocket Diary that puts memos, letter dictation, notes, interviews, *anything* "on the record" as it happens . . . the DeJur electronic memorizer won't let you forget!

$59.50

CARRIES ITS OWN POWER, OPERATES ANYWHERE (3 penlite batteries)

IN YOUR CAR . . . ON THE TRAIN . . WHILE WALKING . . .

THE EN-3 NEVER FORGETS AN ESSENTIAL TOOL FOR BUSINESSMEN, PROFESSIONALS, STUDENTS, SCIENTISTS, ETC.

RECORDS AND PLAYS UP TO 44 MINUTES OF NOTES, DICTATION, SALES CALLS, REPORTS, CONFERENCES, LECTURES, INTERVIEWS.

ESTABLISHED 1933 BElmont 5-4577

BALTIMORE DICTATING MACHINE CO.

3316 GREENMOUNT AVENUE BALTIMORE, MARYLAND 21218

the psychological and general physical deterioration consequent to a radically destructive procedure which precludes normal function? Only rarely will reconstruction conceal a recurrence and deceive the meticulous examiner. Performance of multiple biopsies during a series of reconstructive procedures often has disclosed clinically unsuspected recurrence which has yielded to further surgery. Patients who develop recurrence in nonresectable areas obtain considerable dividends from immediate reconstruction.

Flap preparation at the time of resection saves time. In the usual case, construction of a cervical or forehead flap is performed in conjuction with the extirpative procedure. The occasional patient will be managed most efficiently by flap preparation before resection. Delayed reconstruction is reserved for selected patients with anaplastic tumors in whom further removal of tissue would be possible and in whom the functional and cosmetic deficit is compatible with a happy, useful existence.

The extent to which reconstruction is pursued is governed by the patient's desires and the surgeon's ability to achieve further improvement. The *effective* degree of cosmetic deformity must be appraised carefully; the limitations of plastic surgery must be realized. Reconstruction should always be planned and often initiated at the time of tumor resection.

The Johns Hopkins Hospital
Baltimore, Md 21205

Sustained circulatory, respirator and cerebral stimulation for th

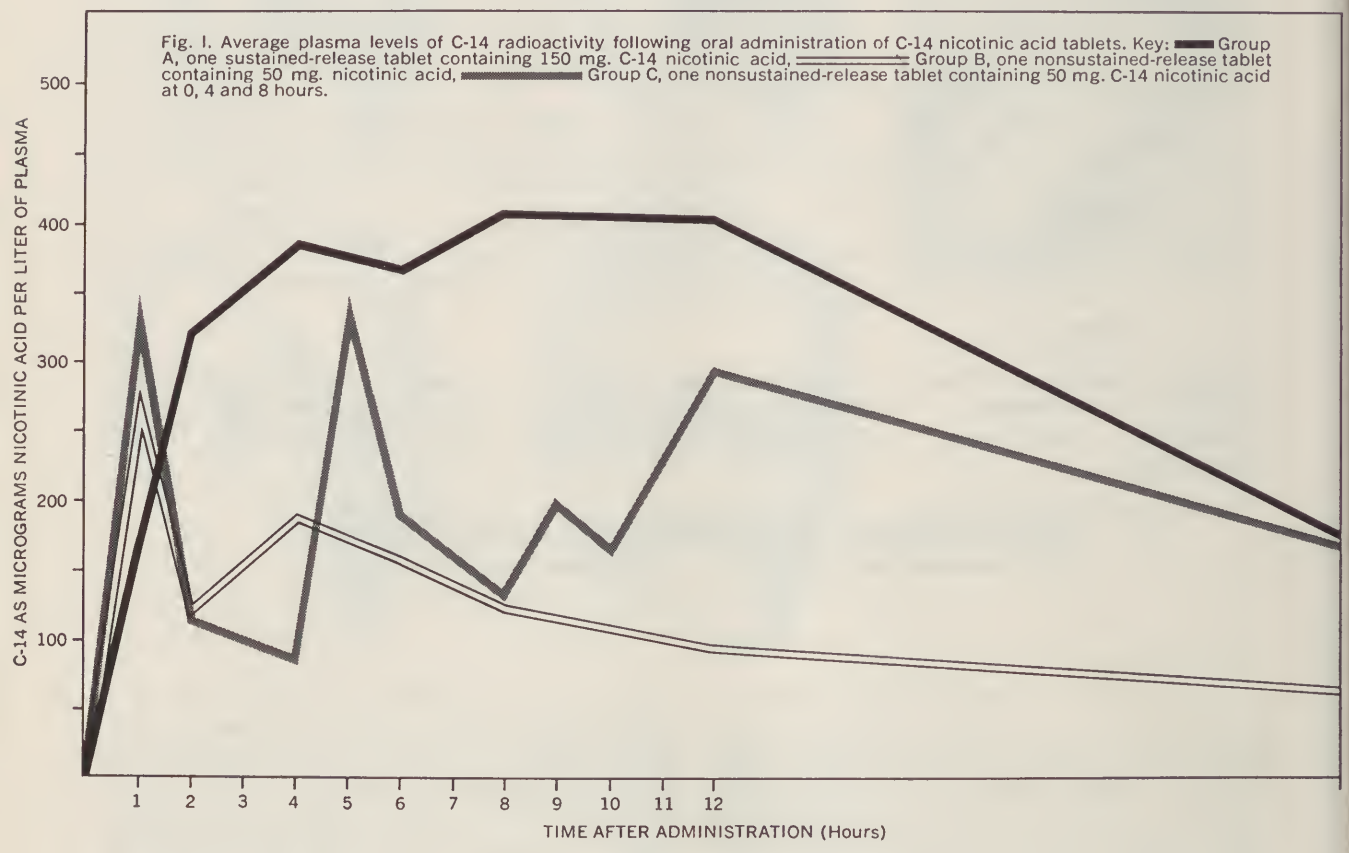

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

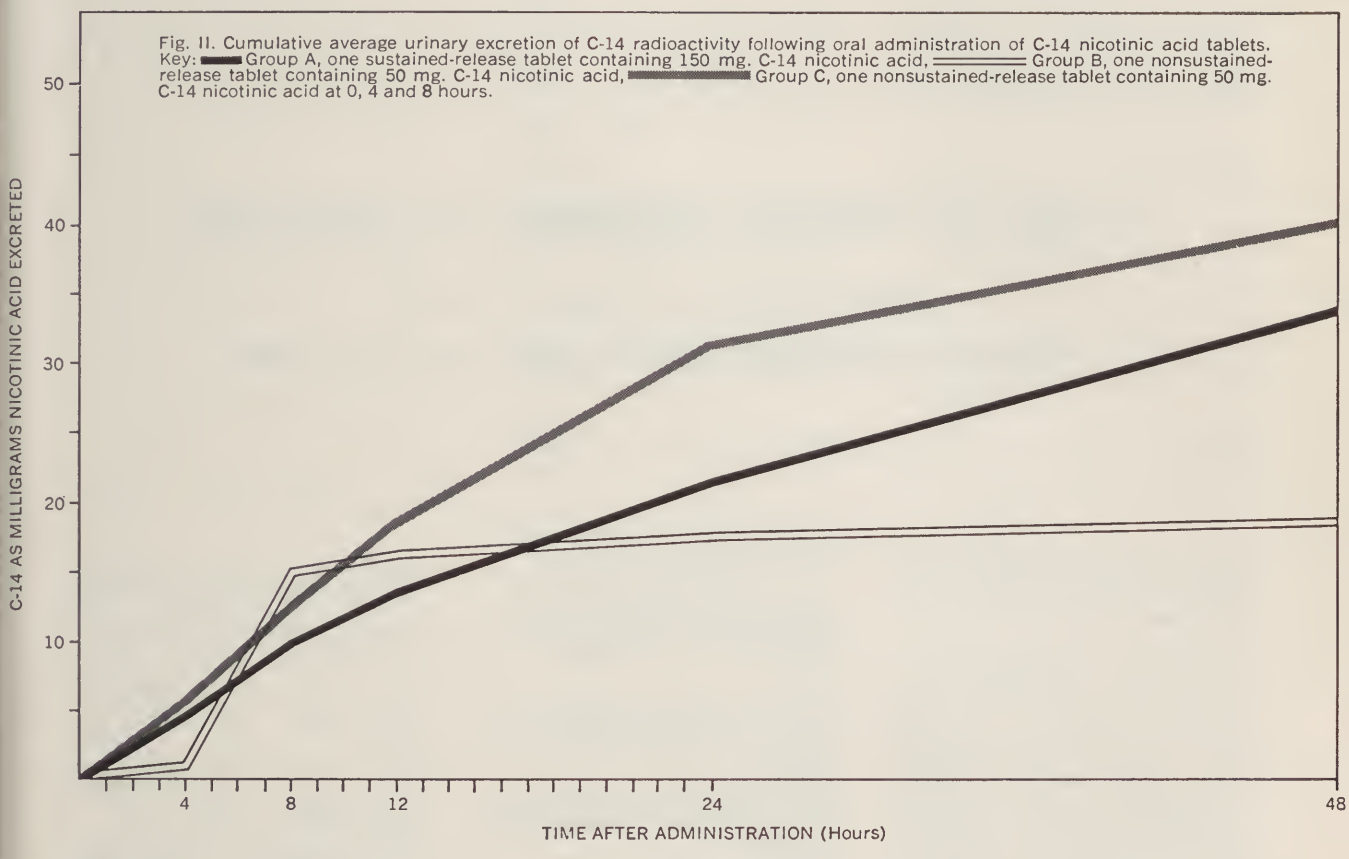
(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

An eminent role in medical practice

- Clinicians throughout the world consider meprobamate a therapeutic standard in the management of anxiety and tension.
- The high safety-efficacy ratio of 'Miltown' has been demonstrated by more than a decade of clinical use.

Miltown®
(meprobamate)

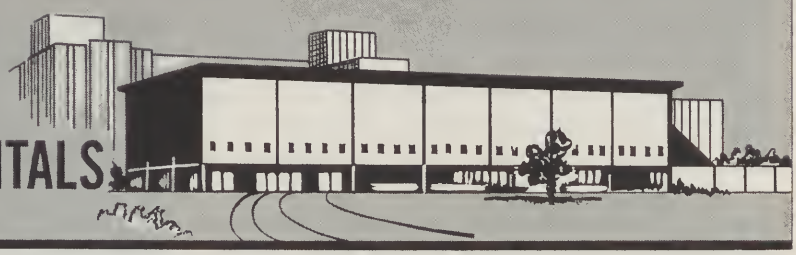
Indications: Meprobamate is effective in relief of anxiety and tension states. Also as adjunctive therapy when anxiety may be a causative or otherwise disturbing factor. Although not a hypnotic, meprobamate fosters normal sleep through both its anti-anxiety and muscle-relaxant properties.

Contraindications: Previous allergic or idiosyncratic reactions to meprobamate or meprobamate-containing drugs.

Precautions: Careful supervision of dose and amounts prescribed is advised. Consider possibility of dependence, particularly in patients with history of drug or alcohol addiction; withdraw gradually after use for weeks or months at excessive dosage. Abrupt withdrawal may precipitate recurrence of pre-existing symptoms, or withdrawal reactions including, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, the dose should be reduced and operation of motor vehicles or machinery or other activity requiring alertness should be avoided if these symptoms are present. Effects of excessive alcohol may possibly be increased by meprobamate. Grand mal seizures may be precipitated in persons suffering from both grand and petit mal. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side effects: Drowsiness may occur and, rarely, ataxia, usually controlled by decreasing the dose. Allergic or idiosyncratic reactions are rare, generally developing after one to four doses. Mild reactions are characterized by an urticarial or erythematous, maculopapular rash. Acute nonthrombocytopenic purpura with peripheral edema and fever, transient leukopenia, and a single case of fatal bullous dermatitis after administration of meprobamate and prednisolone have been reported. More severe and very rare cases of hypersensitivity may produce fever, chills, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, anaphylaxis, stomatitis and proctitis. Treatment should be symptomatic in such cases, and the drug should not be reinstituted. Isolated cases of agranulocytosis, thrombocytopenic purpura, and a single fatal instance of aplastic anemia have been reported, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity has been reported, usually after excessive meprobamate dosage. Suicidal attempts may produce lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Usual adult dosage: One or two 400 mg. tablets three times daily. Doses above 2400 mg. daily are not recommended.



Supplied: 'Miltown' (meprobamate) is available in two strengths: 400 mg. scored tablets and 200 mg. coated tablets. 'Meprotabs' (meprobamate) is available as 400 mg. white, coated, unmarked tablets. *Before prescribing, consult package circular.*

HISTORY OF THE BALTIMORE CITY HOSPITALS

BY DOUGLAS CARROLL, M.D.

Chapter 9.—The Baltimore City Hospitals Under the Department of Public Welfare: Social Change (1935-1955)

So have attitudes toward medical care shifted over the centuries: from a "blessed benevolence" or a "private luxury," medical care has gradually assumed the status of a necessity and a "civic right." The speed and degree of the most recent change have been so great that we may be said to be living in a veritable "revolution of rising expectations" in regard to health and medical care.[1]

This period started with the Great Depression, with its mass of unemployed patients on welfare. It progressed through the Second World War and ended in a period of unusual prosperity. Under the Department of Public Welfare, administrative procedures improved efficiency. More significant was the growing acceptance of the idea that the poor and unemployed had certain rights due them from the state and were not mere subjects of benevolent paternalistic private charity.[1]

At the beginning of the period, the new Acute Hospital, the north section of the B Building, and the new Nurses' Home were put into operation. The new Tuberculosis Sanitarium was completed in 1937. During World War II and thereafter all services deteriorated. Toward the end of this 20-year period, it became obvious that all services would have to be headed by full-time chiefs, that renovation of the Almshouse would be required, and that additions to the General Hospital were essential.

A number of men influenced this era in the hospital's history. Dr. George Walker, a urologist in private practice in Baltimore and a member of the Board of Trustees foresaw the need for an acute general hospital. It was his vision which resulted in the building of the present Acute Hospital. Dr. Walker was also instrumental in having the Baltimore City Hospitals placed in the Welfare Department and, along with Dr. Alan Chesney, in cementing the relationship with the medical schools.

Another man influencing the hospital during this period was Mr. Thomas J. S. Waxter (1898-1962), who was the first director of the Baltimore City Department of Public Welfare. He was particularly concerned that the hospital render excellent care to the indigent of Baltimore. He was ably assisted by Mr. Francis Davis of the Board of the Department of Public Welfare. The hospital was fortunate in obtaining as superintendent Mr. Parker J. McMillin, who directed the hospital throughout this period and retired in April, 1959.

The new Acute Hospital (present A Building) was opened March 1, 1935. The building was in form of an E, and it contained the obstetrical, surgical, medical and pediatric services. The operating rooms were on the top (fifth) floor. Administrative offices, the emergency room, laboratories, the pharmacy, the Department of Pathology, and x-ray were on the lower floors. Each clinical service was laid out on a single floor with 100 beds.

In 1935, the north section of the Chronic Hospital (present north section of the B Building) was opened. The chronic neurological ward, a chronic orthopedic ward, and chronic medical and surgical wards were located in this section.

During the next few years, applications for housestaff positions exceeded anything which had ever occurred before. The Medical Advisory Board met monthly and made numerous recommendations to the Department of Public Welfare.

WPA labor was used for several years to renovate and recondition the Infirmary and other buildings of the hospital. The farming operation consisted of a large truck farm and a dairy herd of 70 milk cows with two bulls. In 1937, after the extensive building and renovation, all patients were housed in reconditioned or new buildings. No further major changes in buildings occurred until the addition of the Outpatient Department in 1950, the building of the new Tuberculosis Sanitarium in 1954, and the renovation of the Infirmary in 1959.

Hospital costs gradually increased and were ascribed to the development of modern facilities, the decreasing number of people admitted able to perform work, and the gradual improvement in the standard of service and medical care.

In 1937, Dr. Frank Kendall, who for many years had been resident in pathology in the Johns Hopkins Hospital, became pathologist-in-chief at the Baltimore City Hospitals, the first full-time chief of a service. On September 1, 1936, Dr. Thomas R. Boggs, physician-in-chief since 1911, died and was succeeded by Dr. John T. King. In 1939, Dr. Arthur M. Shipley resigned as chief of Surgical Service and was replaced by Dr. Thomas B. Aycock. In 1940, through the efforts of Dr. John T. King, the United States Public Health Service established a research unit of the newly formed Department of Gerontology under Dr. Edward J. Stieglitz. This new unit was to study the problems of aging and, over the years, has gradually increased in importance and flourished under Dr. Nathan Shock. In 1943, the Psychiatric Service was discontinued at the Baltimore City Hospitals and was taken over by the State of Maryland. In 1948, all farming operations were discontinued.

World War II brought on tremendous problems for the hospitals. The number of visiting physicians and housestaff dwindled. The Pediatric Service was closed, and admission to the Obstetrical Division was restricted. Red Cross nurse's aides, Grey Ladies, and home nursing and dietitian aides helped fill the gaps in the nursing

A cup awarded to the Baltimore City Hospital dairy herd in 1945. All farming operations (started in 1866) were discontinued in 1948, thus ending the workhouse function of the Almshouse.

service. In 1946, the personnel deficiency was at its worse. German prisoners and conscientious objectors, who had previously been working in the hospital, were withdrawn at the end of the war. The shortage of nurses was met to some extent by the graduates from the School of Practical Nursing.

The hospital had by no means recovered from the deterioration of World War II when the Korean conflict took place. Toward the end of this period, it became clear that the serious personnel shortages could not be met by methods used in the past. Although the shortage of doctors was serious, Dr. Holmes Boyd and Dr. Otto Brantigan carried on excellent services as chiefs of medicine and surgery, respectively. In 1945, Dr. Harold Harrison was selected as full-time chief of pediatrics; Dr. Frederick Mandeville, as full time chief of X-ray Department; and Dr. Gardner Warner, chief of pathology. It became obvious that the most effective operation of the hospital would require that each department be headed by a full-time man. In the fall of 1952, Dr. George Mirick became the first full-time chief of medical service. In 1948, an eight million dollar bond issue had been passed by the people of Baltimore to construct a new tuberculosis unit and to renovate the Infirmary. As the new buildings became available and the number of full-time chiefs of service increased, the overall operation of the hospital improved radically.

After the great depression of 1929, a major change occurred in the attitude of the City toward the sick poor. At first, attempts were made to give relief through private charities, local municipal government, and the State; but finally the need for federal aid became clear. The belief that unemployment was not the fault of the individual was now clearly accepted.

Looking back, in 1952, on the work of the Department of Public Welfare of Baltimore, Mr. Thomas J. S. Waxter, director of the department, pointed out that the principle of assistance to the disabled and partially disabled was not new in the 1930's, but the volume and methods started in these years of depression were new and not completely accepted by all segments of American voters.

> Probably public assistance is now, insofar as public attitude is concerned, in the same position as the public health movement and the public school movement years past, before they had become generally accepted.
>
> Against this newness and the American attitude of giving short shrift to failures and a small hard core of people, who resent change of any kind, it has been difficult for those of us who believe in public assistance to gain the kind of approval for the public assistance program, which the public health authorities, the schools and such agencies as the public library enjoy. The beneficiaries of the public assistance program are the most handicapped and the least vocal group in the community.[2]

A second great force changing attitudes toward the poor was the pervasive influence of Sigmund Freud. He preached that there were hidden and uncontrolled instincts in all people, rich and poor alike, which, when exaggerated, led to certain mental illnesses. All people were in the grip of potentially disruptive forces. Health passed imperceptibly into sickness and virtue into sin. Therefore, all men were vulnerable to mental illness, irrational behavior, and depravity.

Furthermore, Freud's method was that of listening to people, accepting them as they were, and taking them seriously. His attempt to take the time to understand others was a measure of belief in the dignity and freedom of other individuals, no matter how perverse.

The depression helped men to see poverty as the result of circumstances beyond the control of the individual. Freud helped men to see that all men are vulnerable yet are capable of recovery. Thus, public welfare became acceptable treatment for those unable to care for themselves. Welfare services administered justly under federal, state, and municipal law became the order of the day.

The founding of the Department of Welfare and its direction under trained professional workers interested in the poor added tremendously to the effectiveness and understanding with which the sick were cared for. In the combined report for the years 1954 and 1955, Miss Esther Lazarus, who had replaced Mr. Thomas Waxter as director of the Department of Public Welfare, noted some of the changes made in the 20 years since the founding of the department in 1935.

> Until the 1930's, society here and elsewhere accepted and operated on the assumption that there must be something fundamentally wrong with the individual in need. We viewed as different in kind and quality from the rest of the population the clients of social agencies, and we invested these persons with certain unique defects and weaknesses. The Depression proved this atti-

tude to be untrue. As economic breakdown unfolded and enveloped millions, depriving them of the opportunity to meet their basic needs for living, we began to recognize the forces operated in an industrial society which were beyond the control of any individual.[3]

She noted the shift in emphasis from *problems* and procedures designed to meet crises to emphasis on *people affected* by problems and on protective and preventive services. She noted that the Social Security Act, passed in 1935, marked a major milestone in the development of the country's philosophy of social welfare.

"From the beginning, the Department of Public Welfare has been concerned that services be given in such a way as to preserve and reinforce the dignity and integrity of the individual."

In the care of children who became the responsibility of the Department of Public Welfare, every effort was made to nourish any spark of family life that might allow the child to remain with his parents while under the supervision of the department.

The synthesis of cortisone was accomplished by Merck Sharp & Dohme in 1948—the famous "Compound E" used by Dr. Philip Hench in his historic experiment at the Mayo Clinic.

But proud as we are of our role in the development of cortisone and subsequent corticosteroids, we have continued to seek a greater understanding of arthritic disorders and new drugs for their treatment.

One such drug—INDOCIN® (indomethacin), a nonsteroid, anti-inflammatory agent fundamentally different in structure and activity from other drugs in use—was recently made available for the treatment of arthritic conditions. It opens new possibilities for the long-term management of arthritis and inflammatory disease.

MSD **MERCK SHARP & DOHME** | **where today's theory is tomorrow's therapy**
Division of Merck & Co., INC., West Point, Pa.

INDOCIN®

INDOMETHACIN

Indications: Chronic and acute rheumatoid arthritis, rheumatoid (ankylosing) spondylitis, degenerative joint disease (osteoarthritis) of the hip, and gout.
Contraindications: Active peptic ulcer, gastritis, regional enteritis, or ulcerative colitis. Safety in pregnancy has not been established. Not recommended for pediatric age groups.
Warning: Patients who experience dizziness, lightheadedness, or feelings of detachment on INDOCIN should be cautioned against operating motor vehicles, machinery, climbing ladders, etc. Use cautiously in patients with psychiatric disturbances, epilepsy, or parkinsonism.
Precautions and Adverse Reactions: Most commonly, headache, dizziness, lightheadedness, G.I. disturbances. The C.N.S. effects are often transient and frequently disappear with continued treatment or reduced dosage. The severity of these effects may occasionally require cessation of therapy. G.I. effects may be minimized by giving the drug with food or with antacids or immediately after meals. Ulceration of the stomach, duodenum, or small intestine has been reported and, in a few instances, severe bleeding with perforation and death. Gastrointestinal bleeding with no obvious ulcer formation has also been noted; INDOCIN should be discontinued if G.I. bleeding occurs. As a result of G.I. bleeding, some patients may manifest anemia, and for this reason periodic hemoglobin determinations are recommended. Rare reports of effects not definitely known to be attributable to INDOCIN include bleeding from the sigmoid colon (either from a diverticulum or without a known previous pathologic condition), perforation of preexisting sigmoid lesions (diverticulum, carcinoma), and hematuria. In other rare cases, a diagnosis of gastritis has been made while the drug was being given. One patient developed ulcerative colitis, and another, regional ileitis, while receiving INDOCIN; when the drug was given to patients with preexisting ulcerative colitis, there was an increase in abdominal pain. Infrequently observed side effects may include drowsiness, tinnitus, mental confusion, depression and other psychic disturbances, blurred vision, stomatitis, pruritus, edema, and hypersensitivity reactions. Slight BUN elevation, usually transient, has been seen in some patients, although the preponderance of evidence indicates that INDOCIN does not adversely affect renal function, even in patients with preexisting renal disease. Nevertheless, renal function should be checked periodically in patients on long-term therapy. Leukopenia has been seen in a few patients. Transient elevations in alkaline phosphatase, cephalin-cholesterol flocculation, and thymol turbidity tests have been observed in some patients and, rarely, elevations of SGOT values; the relationship of these changes to the drug, if any, has not been established. As with any new drug, patients should be followed carefully to detect unusual manifestations of drug sensitivity.
Before prescribing or administering, read product circular with package or available on request.

COMPONENT MEDICAL SOCIETIES

ANNE ARUNDEL COUNTY

Our fifth annual banquet and dance was held June 4 at the Annapolis Roads Country Club. It was the biggest and best yet.

Among the guests of the Society were the administrators of Anne Arundel County's two hospitals, and their wives.

Cocktails and a buffet supper were served. During the dancing intermission, several talented members of the Society entertained. **Drs. Antonio Rivera** and **Max Frank,** our Spanish linguists, sang some Latin songs. A clever skit humorously depicted the new cardiac unit at the Anne Arundel General Hospital. **Drs. Gerry Church** and **Bill Wallop** sung "Medicare Blues" to the tune of "Wouldn't It Be Loverly."

MEDICARE BLUES
(Lyrics by Church and Wallop)

We're very sad this year,
We feel we're filled up with despair,
The President wants to open up a plan called Medicare,
To all of us this plan seems bad and anything but fair,
Oh, oh, wouldn't it be loverly.

—1—

All we want is to work somewhere
Far away from the Medicare,
Where we won't tear out our hair,
Oh, wouldn't it be loverly.

—2—

No King-Anderson or such health bill,
No more forms for us to fill,
We'd simply use our skill,
Oh, wouldn't it be loverly.

—3—

Oh so loverly being away from Lyndon B.,
We could have our very own new greater society.

—4—

No new frontiers for you and me,
Hubert Humphrey we'd never see,
We would have an honest fee,
Oh, wouldn't it be loverly.

(repeat 1)

Music for the entertainment was provided by Drs. **Richard Hochman, Gerry Church, Henry**

Holtgrewe, and **Stephen Hiltabidle** (on the washtub). All of the performers were accorded lusty cheers from the members, their wives, and their guests.

Samuel Borssuck, MD

WASHINGTON COUNTY

New Physician in Community

We welcome **Rizalito A. Amarillo, MD,** to our community. He opened his office at 120 Main Street, Sharpsburg. Dr. Amarillo attended high school, college, and medical school in the Philippines. He served his internship and a residency in pathology at the Brooklyn Jewish Hospital in New York. He also served a residency in general practice at the Cabell Huntington Hospital, Huntington, WVa; at the North Charles General Hospital, in Baltimore; and at the Huey P. Long Charity Hospital, Pineville, La.

Dr. Amarillo was in private practice in the Philippines from 1961-64, was house physician in surgery at Marymount Hospital, Garfield Heights, Ohio, from 1964-65, and junior staff physician at the Lynchburg Training School and Hospital, Colony, Va., from 1965 until May, 1966.

The Amarillos are making their home in Sharpsburg.

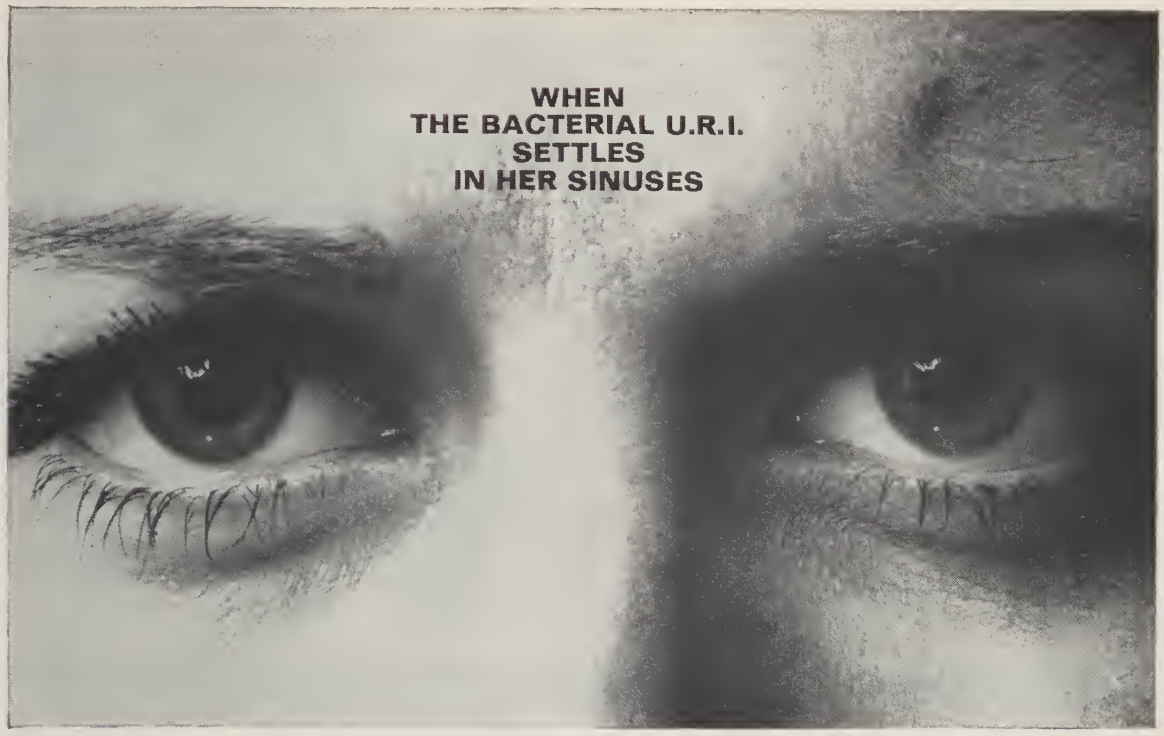
Health Fair

The Washington County Medical Society will again participate in the health fair to be held in Hagerstown in November. **John J. Donoghue, MD,** is working on plans through the Public Relations Committee of the medical society. Details will be announced later.

The health fair will coincide with Community Health Week, sponsored by the American Medical Association.



Richard A. Young, MD, was chairman of the first health fair, held last year. The medical society's exhibit included a demonstration of anatomy, using a mannequin, as well as free urine testing for diabetes, managed by our Woman's Auxiliary.

* * * * *

John C. Stauffer, MD, returned recently from Africa, where he took part in a project sponsored by Operations Cross Roads Africa, a non-profit organization similar to HOPE, in cooperation with the Nigerian government's Ministry of Health. Dr. Stauffer was located at a new general hospital (about 300 beds) in the eastern district of Nigeria, in a town called Enugu. He was there from June 26 through August 26. There is no remuneration for the physicians who take part in this project.

Our president, **Richard A. Young, MD,** had the honor of having his picture appear in a recent copy of the *AMA News.* Dr. Young, one of 13 recipients of the 1965 physicians awards for outstanding community service, was the guest of E. Claiborne Robins, president of the A. H. Robins Co., which sponsors the awards. The affair was held in Richmond in May. It was attended by the 13 physicians who had received the awards.

John W. Clark, MD, DDS

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:			
ACHROMYCIN® Tetracycline HCl	125 mg	Caffeine	30 mg
Phenacetin	120 mg	Salicylamide	150 mg
		Chlorothen Citrate	25 mg

The patient can feel better while getting better. ACHROCIDIN brings the treatment together in a single prescription—prompt symptomatic relief together with early, potent control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract.

Contraindication—History of hypersensitivity to tetracycline.

Warning—If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and if therapy is prolonged, tetracycline serum level determination may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment and treatment should be discontinued at first evidence of skin discomfort.

Precautions—Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect has been observed in usual short treatment courses.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.

AMNIOCENTESIS IN ERYTHROBLASTOSIS FETALIS

W. BRADLEY KING, JR., MD

A number of reports have appeared in recent years on the examination of amniotic fluid in pregnancies in which the development of erythroblastosis is possible. Because the principal problem of the erythroblastotic fetus is severe anemia with subsequent cardiac failure, it is important to know what the effect of sensitization on the fetus has been during the last part of pregnancy. One can then decide whether to carry out fetal intraperitoneal transfusions or to deliver the baby at the best time for survival.

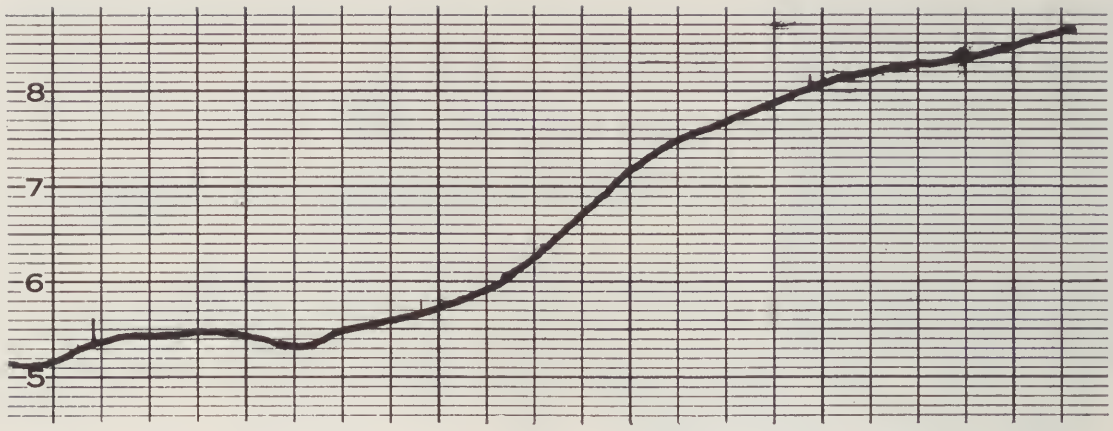
Techniques have been developed to determine levels of bilirubin-like substances in the amniotic fluid. Bevis[1] showed that the amniotic fluid of erythroblastotic fetuses contained an increased quantity of blood pigments, which he believed gave an indication of increased hemolysis. Although the pigment is presumed to be bilirubin, its exact chemical composition is unknown.[4] Subsequent reports have correlated the severity of the hemolytic disease in the fetus with the level of these bilirubin-like substances.

The amniotic fluid specimens are obtained by a transabdominal approach into the amniotic sac (usually near the fetal neck). The specimen is then placed in a dark, stoppered bottle and sent to the clinical laboratory for determination of the bilirubin-like substances.

Since the aspiration of blood or bloody fluid immediately introduces a complication (for it may be from the mother's abdominal or uterine walls, placenta, fetus, or umbilical cord), it is necessary to determine whether the erythrocytes present are maternal or fetal or both. This can be done by the Kleihauer-Betke stain.*[2] The same problem exists if bloody fluid is aspirated from the amniotic sac.

Amniocentesis in patients *known* to be sensitized may be performed as a single determination[3] or as a pair of determinations: if single, at about 32 weeks; if double, the first between 29-32 weeks and the second about two to four weeks later. The purpose of the two determinations is to detect any change in the rate or degree of hemolysis, as manifested in the level of the bilirubin-like substances in the amniotic fluid (Fig 1).

*In alcohol-fixed smears of the bloody fluid, when the smears are then treated with a citric acid-phosphate buffer solution, of pH 3.4 - 3.6, at 37°C, the adult RBC lose their hemoglobin and become shadow forms, whereas the fetal RBC retain their hemoglobin and are still readily visible on the smears.



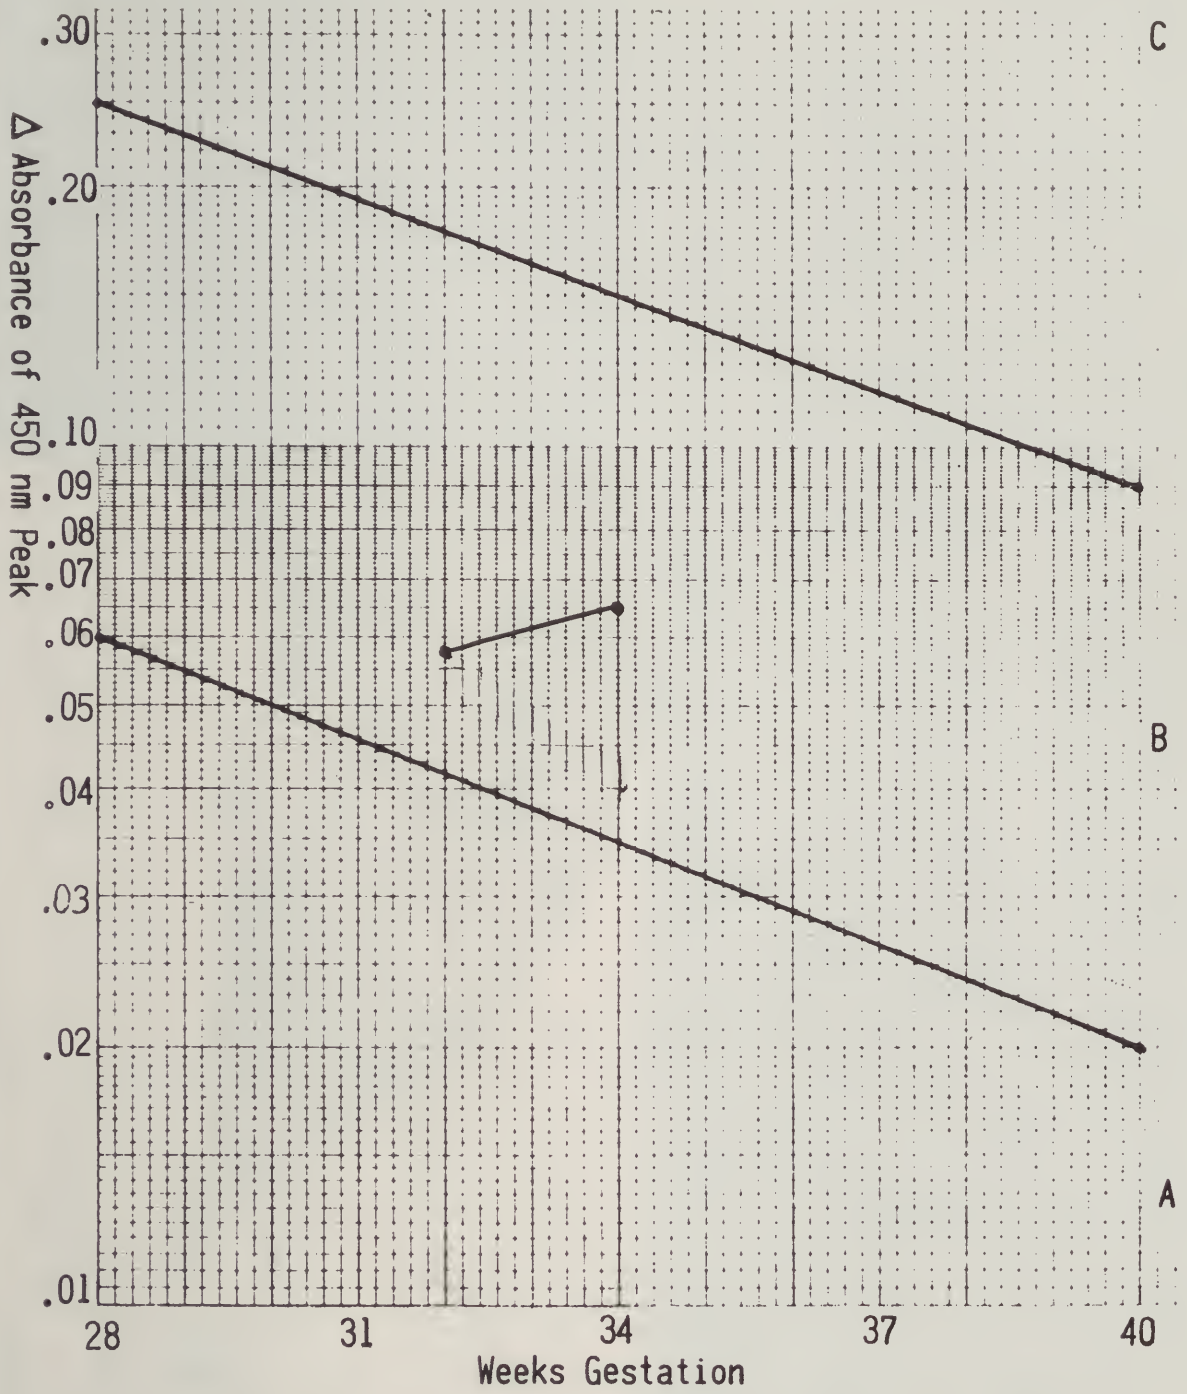


Fig 1 Fig 2 →

The level of these bilirubin-like substances is determined with a spectrophotometer set at 450 mμ. Liley[4] considers centrifugation (30 min at 3,000 rpm) of the specimen adequate in most cases, but if the fluid remains turbid, filtration with Whatman #42 paper and the use of short-light path (2.5 mm) cuvettes, filtration through a cytosieve (Gelman), or dilution will clear the specimen to give a reliable result. Several sources of error are possible: 1) wrong fluid (maternal urine, fetal ascitic fluid, multiple amniotic sacs, and amniotic cysts); 2) wrong pigment or pigment source (serum, hemoglobin, meconium and bilirubin associated with bilirubin regurgitation, as in fetal duodenal atresia); and 3) wrong dates (due to miscalculation of estimated date of confinement), either regarding the planning of the dates for amniocentesis or relating the results from a given amniocentesis to that expected. Minor blood-staining is not important.

The realization that one is determining differences in optical density and *not* absolute values of the "bilirubinoid" pigment is important. Thus, whereas the normal plot of absorbance (OD) of amniotic fluid at various wave lengths is virtually a straight line from 400-600 mμ, when hemolytic disease of the newborn is present, there is a consistent deviation at 450 mμ, and this *deviation* from the straight line is what is actually being measured (Fig 2). The OD may be read at intervals from about 600 down to about 350 mμ and the curve plotted, recording the peak difference at 450 mμ (or, in modern parlance, 450 nm, which is 450 x 10^{-9}M or 450 nanometers). Freda[5] noted ". . . In every abnormal tracing . . . deviation from the normal slope of the curve *always* begins at about 525 mμ, and the tracing *never* resumes the normal slope until about 375 mμ."

Three major levels of absorbance differences and their interpretations are as follows[3]: Group A, showing little or no deviation at 450 mμ and associated with little or no perinatal mortality and constituting about 25% of cases; Group B, showing a mild bulge of 0.08 to 0.15, constituting about 40% of cases and associated with need for therapy (transfusions or delivery before term or both); and Group C, showing a marked deviation (over 0.15), constituting about 30% of cases, and associated with a high incidence of perinatal mortality, even if everything possible is done.

The importance of amniocentesis is emphasized by Friesen and Bowman[6] in a neat summary of the five major advances in reducing fetal losses due to Rh sensitization: 1) the discovery of the Rh factor, in 1940; 2) the development of exchange transfusion, in 1945; 3) the selective induction of labor, in 1950; 4) spectrophotometric examination of the amniotic fluid, as reported by Liley,[7] in 1961; 5) fetal or intrauterine transfusions, first reported by Liley,[8] in 1963. According to Friesen and Bowman's report, the death rate in sensitized pregnancies has been about halved with each of these advances. Pathologically, though, amniocentesis is the latest advance, and its use will increase with recognition of its importance and adequate instrumentation of the clinical laboratories to perform the procedure.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

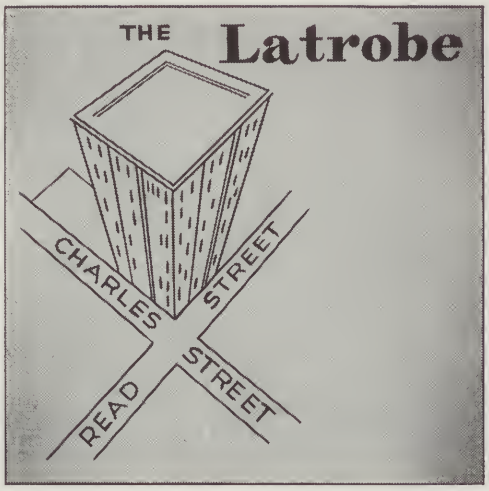
BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.



References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES

TEMPLE UNIVERSITY MEDICAL CENTER
presents the 10th Annual Postgraduate Course

RECENT ADVANCES IN MEDICINE

11:00 A.M. to 4:00 P.M.
on
8 consecutive Wednesdays
from
October 26 to December 14, 1966

The course will consist of seminars, panel discussions, clinics, lectures and ward rounds considering subjects of interest to the family physician. Several distinguished out of state authorities will participate.

Enrollment limited. Registration fee: $50.00

For further information and curriculum, write to:

DEPARTMENT OF MEDICINE
TEMPLE UNIVERSITY HOSPITAL
Philadelphia 40, Pa.

WILLIAM STIFLER, JR., M.D., Chairman

RAY HEPNER, M.D., Editor

EDGAR ALLAN POE SCHOOL

EDITOR'S NOTE: This announcement from the Baltimore City Department of Education has special significance to all of us who work with children. Teenage reproduction is more frequently inefficient and is associated not only with more maternal complications but also with a high risk of low birth weight and all attendant handicapping conditions. The social support offered by this special school may go far to prevent repeaters and an excess production of handicapped future citizens.

An adolescent girl who becomes pregnant is a girl in trouble and one who needs help. She lacks a sense of values and has a poor self concept. Lack of success in school can be a facet of this image. As a girl learns to see herself as having some worth, and if she can see that she is making progress academically, it will be easier to help her make life readjustments.

This month, the Baltimore City Department of Education is opening a school for pregnant girls. The Edgar Allan Poe School #1, located at the northeast corner of Fayette and Greene Streets, will allow a girl to continue her education while pregnant so that she will not lose time and will be able to return to a regular school after her baby is born.

It is recognized that a school is only one of three approaches to the many complex problems facing a pregnant girl. In addition to continuing her education, each girl is expected to receive from a medical facility the proper prenatal care and help from a casework agency, not only for herself but also for her parents, the boy, and his parents.

The school will cover the secondary level, including grades seven through twelve, and if necessary will make individual provisions for an elementary school girl. The teachers will work with the girls with patience and understanding and will have the ability to individualize instruction. The school will operate on a 12-month basis.

All pregnant girls under 16 will be expected to attend the school. Girls will be transferred to School #1 from a regular school upon verification of pregnancy. It is hoped that agencies and doctors will also make referrals to the school.

Persons wishing to make referrals or having questions concerning the school should contact the principal, Mrs. Vivian E. Washington, 467-4000, ext 884.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak *your* language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a *good* printer, let's communicate!

PHYSIOLOGY OF EXERCISE

"The vast field of observation from which medical rehabilitation will have to synthesize its concepts and methods is the clinical physiology of exercise."[1]

Although the cardiovascular, pulmonary, renal, and hemopoetic systems play a supporting role during exercise, it is primarily the neuromusculoskeletal system which is active. This system acts as a unit. The basic physiologic unit is the reflex, and the basic anatomic unit is the peripheral nerve, the myoneural junction, and the muscle fiber.

1. Mechanism of Muscular Contraction.—The contractile molecule is a protein, myosin, of an approximate molecular weight of 800,000. In the rest phase, it is linked to a fibrous protein, actin. The myosin molecule can shorten by approximately 40% during contraction. Contraction is a chemicomechanical process in which the terminal high energy phosphate bond of adenosinetriphosphate (ATP) is split off, supplying energy for the mechanical changes in the contractile protein. Exact concentrations of calcium, magnesium, and potassium are important in this reaction.

Prior to muscular contraction the muscle cells are loaded and ready to contract when triggered by a depolarizing effect of sufficient magnitude; a wave of depolarization takes place, presumably disturbing the ionic equilibrium sufficiently to cause contraction.

Each motor nerve fiber or motor unit divides locally to innervate five to several hundred muscle cells. There is an all or none response of each motor unit. An artificial single stimulus to a motor unit or a larger segment is a muscle twitch. For .001 second after the stimulus reaches the muscle, there is a latent period without contractures, followed by an extremely short period of contracture. The refractory period is completed during the latent period (synaptic transmission and early depolarization). Repeated stimuli at 30 to 40 per second give a tetanus, a smooth wave of sustained contraction. Slower stimuli give a step like curve of contraction (incomplete tetanus).

Normally stimuli arrive through motor nerves at a rate of 10 to 15 per second. These stimuli act in an asynchronous manner on different motor units thus making a smooth motion.

2. Neurological Integration of Muscular Activity.—The activity of the neuromusculoskeletal system may be thought of as resting on reflexes of increasing complexity as activities become conscious and voluntary. Every unconscious or voluntary activity starts with a sensory component carried through a single synapse or group of synapses, resulting in motor nerve impulses and muscular activity. At the simplest level, the sensory stimulus of a tap on the quadriceps tendon is carried to the cord through a single synapse to the motor cells which are activated to cause sudden contracture of the quadriceps muscle. More complex reflexes are represented by the crossed extensor reflex and the tonic neck reflexes. A multitude of these involuntary reflexes subserve the more conscious activities, yet many conscious movements (such as walking) which require a prolonged learning process become practically unconscious. Even the most unusual and complex voluntary motions may be thought of as the result of the sensory reflexes entering the body through

sight, hearing, taste, and feeling. These sensory stimuli may be modified by complex higher centers concerned with judgment and memory, but in the sense that most experience is accumulated through the senses, we can think of motor activity as influenced by some recent or former sensory stimuli.

3. Functions of Various Levels of the Nervous System.—The spinal cord has three main functions: it contains the centers for the transfer of impulses; it contains the motor cells of the final common pathway; and it contains the basic elements of crude motor patterns, especially those of locomotion.

The subcortical centers are concerned with the smoothing of muscular activity and the integration of sensory stimuli from special sense organs and the labyrinthine apparatus.

The cerebellum also plays a smoothing and coordination role in movement, especially the integration of proprioceptive information into the motion pattern.

The cerebrum has been considered as the center of initiation of voluntary motion. We have mentioned above that much so called voluntary motion is set off from sensory stimuli and is only modified by judgment and memory in the cerebral centers. To some degree the cerebrum is a synaptic center between sensory information and muscular activity.

4. Nervous System Integration of Motion Patterns.—We can think of any individual motion starting as a response to some external event. Sensory data is fed into the cortical area through the special senses, where it is modified in the light of purpose and past experience. A choice is then made of a possible motor response which is started into execution through the efferent nerves. If the selected activity is one which has been learned, the activity will be performed semi-automatically. If it is a complex unusual motion, proprioceptive and sensory information from the cerebrum, the lower centers and the cerebellum will have to be integrated into the motion while it is being performed. The motor cells of the spinal cord are finally impinged upon as the final common pathway, and the primary reflexes are integrated into the activity.

5. Therapeutic Exercise.—Muscular function may be affected by a variety of neurologic diseases. Muscular activity may also be impaired because of faulty or painful joint function as well as by diseases which involve the muscle itself. In treating any disease which may affect mobility, the purposes of treatment will be of two types: 1) to develop voluntary, well-coordinated movements, 2) to develop strength and endurance. These two purposes are interdependent and must be developed to subserve the patient's needs effectively and safely.

6. Determination of Patient's Needs for Exercises.—To determine what type of exercise and how much is necessary, several factors must be taken into consideration. First, the diagnosis of the disease must have been established and medical treatment of the condition must have been started. The motivation and psychiatric background of the patient being treated must be understood. Second, a knowledge of the actual weakness or dyskinesia present must be obtained. A muscle test may be basic to an understanding of the location of muscular weakness. The effectiveness of treatment can be judged only by having an accurate initial evaluation of muscle strength. A third area which may be important is the sensory evaluation, particularly when dyskinesia is present. A fourth area of importance is the range of motion of joints, the presence of contractures and fibrosis of muscle segments. In muscle paralysis it is particularly important to consider the overall effect of isolated muscular weakness on long-term development of skeletal abnormalities. Finally, a goal must be set for each patient after consideration of the physical, emotional, social, financial, and vocational resources and deficiencies. Only then can a logical program of exercise be set up.

7. Techniques of Developing Muscle Coordination and Strength.—*A. Muscle reeducation:* When a muscle has suffered a complete or partial loss of its motor or sensory innervation, the patient may forget how to use the muscle effectively while the nerve is regenerating. This phenomenon is seen most strikingly in acute anterior poliomyelitis and in peripheral nerve injuries. Frequently, muscles which are not involved take over the activities of paralyzed muscles. The result is that the strong muscles hypertrophy, and the weak muscles are not used and therefore atrophy. It is important, therefore, to prevent substitution pat-

terns and to concentrate on bringing individual weak muscles to full strength while regeneration of the nerve occurs. During the period of regeneration, individual muscles are being strengthened and the use of the strong muscles is kept to a minimum.

B. Development of muscle strength: The strengthening of muscles which are weak because of partial denervation is based on the principal of graded gradually increasing load. With muscle strength grades of "trace" to "poor," the muscles must be strengthened individually by manual methods given by a skilled physiotherapist. It is unlikely that normal muscle can be injured by excessive exercise, but in poliomyelitis particularly, overwork of the muscle may result in declining strength. This may be detected by repeated muscle testing.

For strengthening normal muscle which has undergone disuse atrophy if there is no joint disease, heavy resistance with weights is the method of choice. The most effective method of developing muscle strength over a short period of time is called progressive resistive exercise (PRE). By trial and error, the maximum weight which the muscle can carry through full range of motion 10 times in a prescribed time period is found. This weight then is lifted through the full range of motion 10 times several times daily. This is carried out for five days each week, and the weight is increased each week to the maximum that the patient can do in the 10 motions.

C. Coordination: Coordination is the ability to perform a motion with the right timing of each muscle movement and the proper intensity of muscular contraction. Although coordination depends on normal functioning of all muscles and nerves in the area in use, a good deal can be done to prevent grossly incoordinated movements. This may be done by the prevention of substitution patterns and the use of braces and supports where permanent weakness may be present.

D. Endurance: Endurance refers to the ability to carry out repetitive movements for prolonged periods. Exercises designed to increase endurance do not require great effort but require prolonged repetition.

Cinemicrography* of living tissue shows that Synalar works at the cellular level to stop the inflammatory chain reaction

Inflammatory reaction after injury

*A New View of Corticosteriod Action in Inflammatory Dermatoses
A 16 mm. film utilizing time-phase cinemicrographic techniques. Available for showing on request to Syntex Laboratories.

In contact dermatitis

Synalar®

(fluocinolone acetonide)

stabilizes cell and capillary walls
protects against the chemical impact of cytotoxins

interrupts the chain reaction of destructive changes at the cellular level

permits inactivation, absorption and transportation of toxins away from the injured area by natural processes...edema is absorbed and cells return to normal size, shape, and activity

In inflammatory dermatoses choose a steroid synthesized specifically for topical use. Synalar (fluocinolone acetonide) provides therapeutic results often comparable to those of systemic and intralesional corticosteroids with fewer hazards.[1-3]

when complicated by infection

neo-synalar®

(fluocinolone acetonide-neomycin sulfate cream)

For initiation of therapy: Cream 0.025%, 5 and 15 Gm. tubes, 425 Gm. jars; **for emollient effect:** Ointment 0.025%, 15 Gm. tubes; **for maintenance therapy:** Cream 0.01%, 15 Gm. tubes, 45 Gm. tubes, 120 Gm. jars; **for intertriginous or hairy sites:** Solution 0.01%, 20 cc. and 60 cc. plastic squeeze bottles; **for infected inflammatory dermatoses:** Neo-Synalar® Cream (0.025% fluocinolone acetonide, neomycin sulfate, equivalent to 0.35% neomycin base), 5 and 15 Gm. tubes.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin, (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** Synalar preparations are virtually nonsensitizing and nonirritating. However, the solution may produce burning or stinging when applied to denuded or fissured areas. In some patients with dry lesions, the solution may increase dryness, scaling or itching. The neomycin in Neo-Synalar Cream rarely produces allergic reactions. Prolonged use of any antibiotic may result in overgrowth of nonsusceptible organisms; if this occurs, appropriate therapy should be instituted. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. **Side Effects:** Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions.

RETARDED CHILDREN CAN BE HELPED

MARYLAND ASSOCIATION FOR RETARDED CHILDREN, INC.

1514 Reisterstown Road Baltimore, Maryland, 21208 486-8168

President Mr. David Kahn
Executive Director Morris Scherr
Editor Dick M. Hoover

IQ, Specific Abilities, and Adaptive Behavior

ALFRED M. POMMER, PhD
Clinical Assistant Professor of Pediatrics (Nutrition)
Georgetown University Medical Center

The determination of IQ or mental age is a psychological measure; no reputable psychologist will contend that retarded children can be classified in terms of IQ or mental age alone. The president of the American Association on Mental Deficiency, in his presidential address of June 11, 1965, predicted that within 25 years the terms "mental age" and "IQ" will be used only when speaking or writing historically. D. O. Hebb, in his book, *The Organization of Behavior,* has demonstrated that the IQ which amounts to measurement of an average level of performance in a miscellany of tasks is inappropriate for persons with brain damage. Essentially, IQ tests should not be used to classify children because the performance in all types of intellectual effort must be known and because the computation of an average necessary for IQ tests wipes out information concerning the strength and weaknesses of the individual child.

Batteries of tests are being developed at The Johns Hopkins University, under the leadership of Dr. Henry Mark, which make possible the determination of a profile based on the intellectual ability most developed in a given child in relation to the other abilities of the child. A classification based on a profile such as this is clearly preferable for administrative and educational decisions than one based on either an IQ or a label of "trainable" or "educable."

In the classification of the mentally retarded, adaptive behavior may be more important than intellectual performance; an adaptive behavior rating scale has been developed and may be superior to our present classification of "dependent," "trainable," and "educable." It is certainly more meaningful than IQ. Consider the following example:

> We have two youngsters, both with an IQ, perhaps, of 50. One is able to remain properly dressed, uses limited but clean language, is not hostile, does not get into fights, and is generally not considered a community problem; and the other youngster is slovenly in his behavior, uses improper language, throws rocks, kicks dogs, goes around with his fly open (and here a girl has an advantage over a boy because a dress will stay down naturally). There should be little question in any of your minds as to which of your children will have to eventually be institutionalized or be brought to a clinic. . . . Both youngsters are considered to have the same intelligence, but one more clearly has a lower level of adaptation.[1]

Leland's "Proposed Definitions of General Adaptive Behavior Levels" are published in Parsons State Hospital and Training Center Project News 1, No. 9, December, 1965.

The Research Committee of the Maryland Association for Retarded Children has recommended that suitable steps be taken to improve the classification of retarded children by use of more appropriate and realistic criteria than those based on IQ or mental age. The Board of Directors adopted the recommendation and voted to form a special committee to study a substitute for IQ scores.

Although replacing IQ's is clearly in the best interest of the children involved, a suitable substitute must be acceptable to all professional groups concerned. The Maryland Association for Retarded Children, Inc. welcomes comments and suggestions from interested physicians. Communications should be sent to the Executive Director, Maryland Association for Retarded Children, Inc. 1514 Reisterstown Road, Pikesville, Md 21208.

Anatomy of
Low Back Pain #1

the sedentary life is often the seat of low back pain

The human spine is not engineered for prolonged sitting at desks, pianos, typewriters and drafting boards. The stresses set up by the heavy, forward-tilted head and trunk, balanced precariously on an insufficient base, result in strain of the dorsal musculature, particularly at the low lumbar level.

The unusual muscle-relaxant and analgesic properties of 'Soma' make it especially useful in the treatment of low back sprains and strains. 'Soma' is widely prescribed ☐ **to relieve pain** ☐ **to relax muscles** ☐ **to restore mobility.**

Indications: 'Soma' is useful for management of muscle spasm, pain, and stiffness in a variety of inflammatory, traumatic, and degenerative musculoskeletal conditions. It also may act to normalize motor activity in certain neurologic disturbances.

Contraindications: Allergic or idiosyncratic reactions to carisoprodol.

Precautions: 'Soma', like other central nervous system depressants, should be used with caution in patients with known propensity for taking excessive quantities of drugs and in patients with known sensitivity to compounds of similar chemical structure, e.g., meprobamate.

Side Effects: The only side effect reported with any frequency is sleepiness, usually on higher than recommended doses. An occasional patient may not tolerate carisoprodol because of an individual reaction, such as a sensation of weakness. Other rarely observed reactions have included dizziness, ataxia, tremor, agitation, irritability, headache, increase in eosinophil count, flushing of face, and gastrointestinal symptoms.

One instance each of pancytopenia and leukopenia, occurring when carisoprodol was administered with other drugs, has been reported, as has an instance of fixed drug eruption with carisoprodol and subsequent cross reaction to meprobamate. Rare allergic reactions, usually mild, have included one case each of anaphylactoid reaction with mild shock and angioneurotic edema with respiratory difficulty, both reversed with appropriate therapy. In cases of allergic or hypersensitivity reactions, carisoprodol should be discontinued and appropriate therapy initiated. Suicidal attempts may produce coma and/or mild shock and respiratory depression.

Dosage: Usual adult dose is one 350 mg. tablet three times daily and at bedtime.

Supplied: Two Strengths: 350 mg. white tablets and 250 mg. orange, two-piece capsules.

Before prescribing, consult package circular.

for the relief of low back sprains and strains

History and Objectives of the AAGP

G. OVERTON HIMMELWRIGHT, MD
President, Maryland Academy of General Practice

It is with great pleasure that the Maryland Chapter of the American Academy of General Practice is once again able to resume its contact with all physicians in Maryland through this *Journal.* Since the recent graduates of medical schools have not been exposed to the family physician or a general practitioner, due to the fact that medical school hospitals and their staff have been restricted to a practice of a referred, consultative, medically esoteric type, the modern young physician does not have the knowledge or understanding of the everyday medical practitioner, especially the family physician. The average young graduate in his medical discipline has not run the full gamut in his training of preventive and restorative functions in medical care, to the complete spectrum of deviations from health and actual medical practice, which involves first contact, continuing and comprehensive care of the individual, his family unit, as well as the role that society plays.

The first and general principle of the Academy is that the family doctor should be willing to accept total and continuing responsibility for the medical care of the patient as an individual, the family as a unit, and with society as a whole. The following is quoted from *AAGP History and Objectives.*

In the beginning, all doctors were general practitioners. Their job was to cure the sick. The same doctor treated mumps, malaria or gout.

Formal medical education simply didn't exist. Anyone interested in medicine, practiced medicine. There were no rules or regulations—just the Hippocratic oath. Success was on a trial and error basis. Gradually, of course, medical schools opened and offered formal teaching programs. But there were no standards of quality and the student didn't learn much more than he might have learned by sitting in a doctor's office.

Late in the nineteenth century, laboratories and centers of research announced new discoveries. Age-old mysteries were solved. Each new fact or bit of information unlocked other doors. The empirical approach was abandoned—the scientific approach had arrived.

It suddenly became impossible for one man to know all there was to know about medicine. Despite years of formal education, he could only learn so much. Medical care had reached an era of specialization.

This was good for medicine. It provided doctors who knew a great deal about certain diseases or parts of the body. These men were, and are, of invaluable assistance to physicians who treat the patient as a sick person.

There was, however, a secondary effect. The specialists set up examining boards to decide who could be a specialist. This, in turn, created an aura of glamour in the minds of medical students. Many became convinced that they could not be successful, either professionally or financially, unless they specialized. In 1940, only one out of every 10 medical students planned to enter general practice.

Soon the specialists outnumbered family doctors on many hospital staffs. The general practitioner found that he was not allowed to engage in many medical and surgical procedures—despite more-than-adequate training.

Today's general practitioner, or family doctor, doesn't *want* to do delicate surgery or handle complicated medical problems. When he needs advice or assistance, he calls in a specialist. However, he knows that he is qualified to handle more than 85 per cent of all illness.

The trend toward specialization hurt the family doctor. People began to regard him as a bearded old gentleman with a kindly countenance and frayed cuffs. He was a doctor who supposedly relied on herbs, tonics, Hinkle pills—and Fate. People lost confidence in him.

As late as 1947, at a New York Academy of Medicine meeting, the general practitioner was described as a doctor who couldn't get (or couldn't afford) specialty training.

More important, the pendulum's rapid swing led to misconceptions and confusion. People forgot that choosing the proper specialist is part of the family doctor's job and that self-diagnosis may be costly and dangerous.

The same people also forgot that a highly-trained specialist is not always able to perform the services of a competent general practitioner. It was soon acknowledged that years of concentration on a single specialty lead to the loss of basic knowledge. A routine physical

examination, by the family doctor's standards, would not be routine to the man who hasn't done one for many years.

By 1947, family doctors were in short supply. For years, medical schools had turned out too many doctors who planned to be specialists. Surgeons were available, as were obstetricians, pediatricians, gynecologists, ophthalmologists, cardiologists, and others. But the patient who woke up in the middle of the night with severe stomach cramps had forgotten who to call. He needed, and will always need, a competent family doctor.

To counteract the pendulum's swing, the American Academy of General Practice was organized in June, 1947. A handful of family doctors, no more than 150, met in Atlantic City. It was a spontaneous movement. First, they drew up a Constitution and set positive objectives.

1. To promote and maintain the highest standards of general practice.
2. To encourage medical students to became qualified family doctors.
3. To preserve the general practitioner's right to practice medicine to the full extent of his ability and training.
4. To provide postgraduate training opportunities for the family doctor.
5. To advance the science of medicine and the nation's health and welfare, and to preserve the right of free choice of physician to the patient.

The founders of the Academy were determined that this would be more than just another medical association. Its standards would be high; its program, objective.

A chain reaction started. State and county chapters were organized in all parts of the country. Today, the Academy has more than 28,000 members and is the nation's second largest medical association.

How were the objectives accomplished? What accounts for the Academy's growth? There are many answers.

First, the Academy set rigid qualifications for membership. It recognized that no doctor ever *completes* his medical education. If he is to keep up with progress, he must *keep* studying. This involves a loss of time and a sacrifice of income—but it's more important than either.

Consequently, the Academy became the first medical association to require *continuing* postgraduate education. Every three years, each member must complete 150 hours of accredited study. If he doesn't, he loses his membership. He can be reinstated only by making up lost hours.

The Academy is still the only medical association requiring postgraduate study. Although many specialist organizations have devised membership examinations, these are simply evidence that on a certain day, a certain doctor passed a certain examination. There has been no guarantee that these physicians keep abreast of current trends or take an active part in postgraduate education.

Actually, many Academy members could qualify for specialty rating. They prefer, however, to be general practitioners. They recognize the greater challenge and the greater opportunities for service in treating people —not merely diseases. They cherish the warm human relationships that can develop only between a family doctor and families under his care. They have learned the importance of approaching the patient as a complete individual, influenced by his family and community backgrounds, and subject to many pathologic and traumatic factors. They constantly seek training that qualifies them to evaluate the background influences as well as to treat the disease.

The purpose of the Academy's postgraduate program is to help members become better family doctors. The Academy does not wish to transform the general practitioner into a sort of hybrid or pseudo-specialist.

The annual scientific assemblies of the Academy, as well as the chapter's scientific assemblies, are designed to support postgraduate requirements. Unlike other medical meetings, each assembly program is part of a long range teaching plan. We in the Maryland chapter have an active educational committee, which is responsible for the long range program of postgraduate education here in our state and which works closely with the chairman of postgraduate education at the University of Maryland School of Medicine.

UP TO 10–12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

In sinusitis, colds, or U.R.I., Dimetapp lets congested patients breathe easy again. Each Extentab brings welcome relief all day or all night, usually without drowsiness or overstimulation. Its key to success? The Dimetapp formula—Dimetane (brompheniramine maleate), a potent antihistamine reported in one study to have elicited side effects as few as the placebo,* teamed with decongestants phenylephrine and phenylpropanolamine—in a dependable 10- to 12-hour form.

*Schiller, I. W., and Lowell, F. C.: New England J. Med. 261:478, 1959.

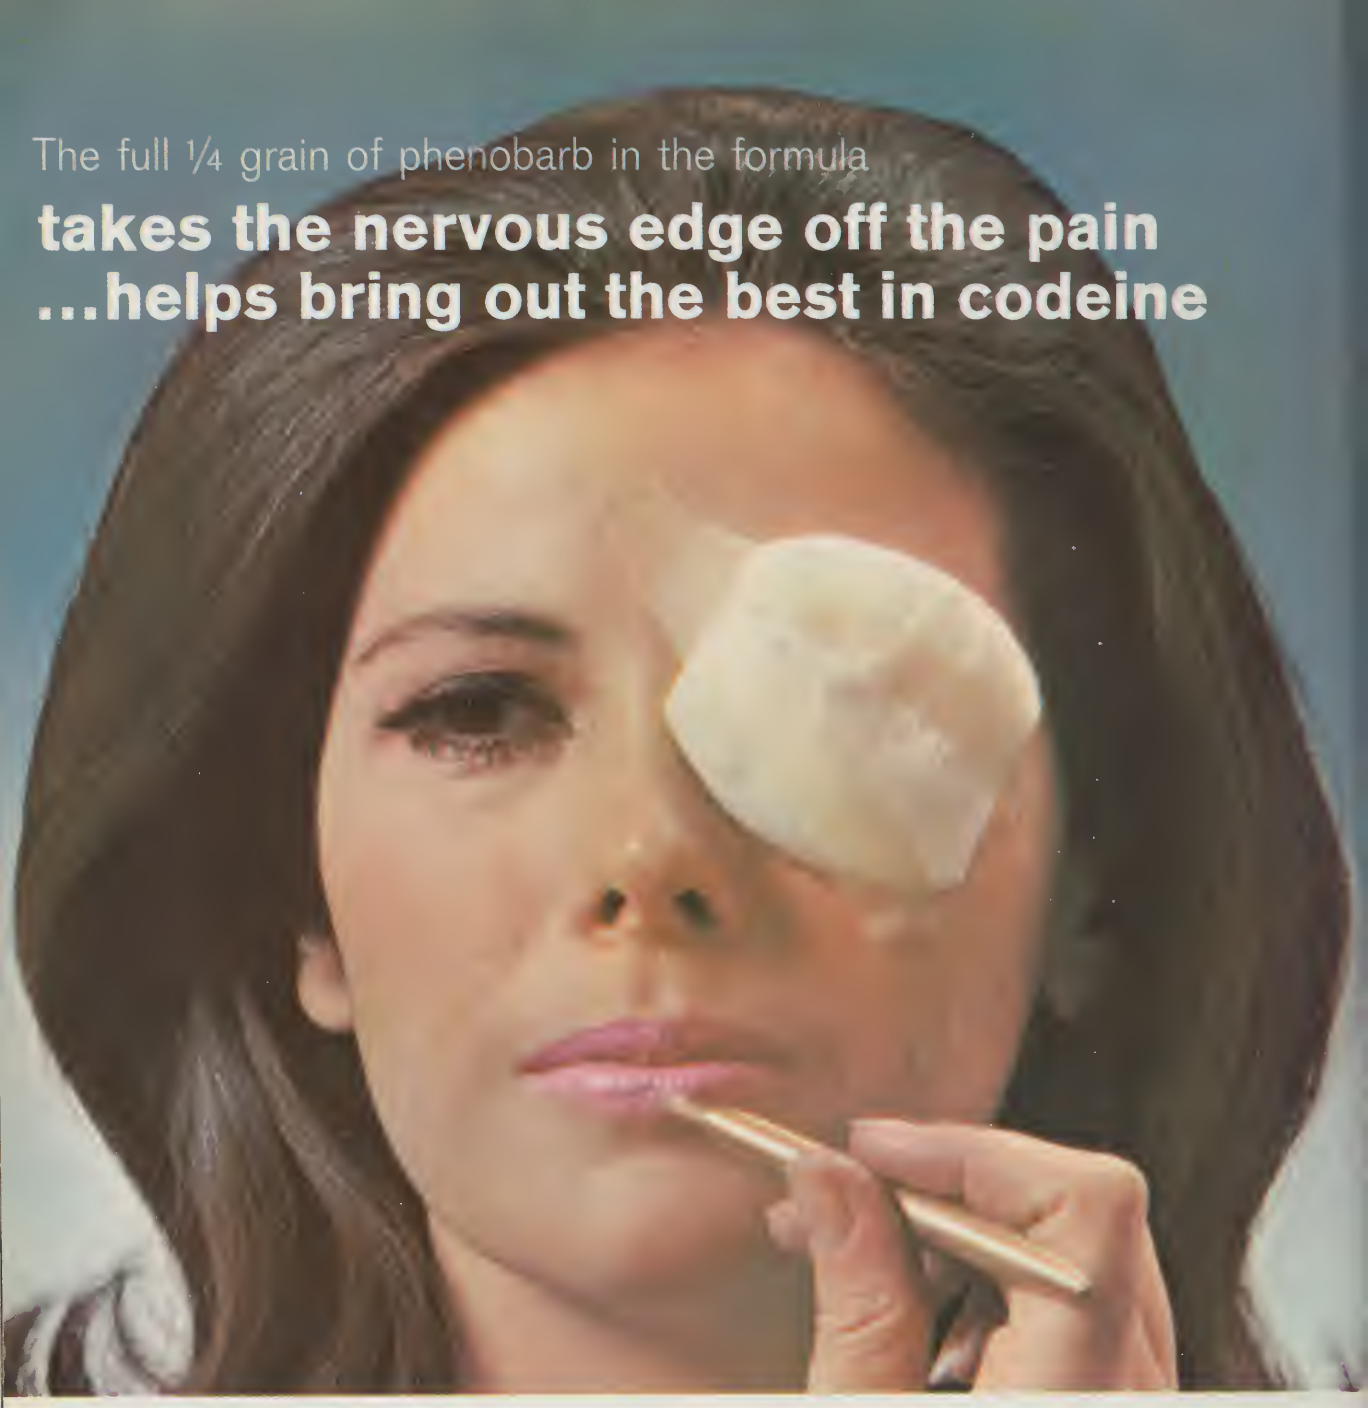
Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.

Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.



Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

PROVES DIRECT LINK BETWEEN ALCOHOLISM AND ACCIDENTS

Seventy-three per cent of drivers responsible for fatal accidents, and 74% of fatally injured pedestrians had been drinking at the time, according to Dr. W. Haddon who spoke at a meeting on Accidents and Alcohol sponsored by the New York Medical Society on Alcoholism. Only 26% of similarly exposed drivers, and 23% of pedestrians who were not involved in accidents had been drinking.

These statistics for New York City correspond closely with statistics from Perth and Adelaide, Australia, Westchester County, Baltimore, Cleveland, Los Angeles County, Sweden, and elsewhere.

Using the results of laboratory and field experiments, and then concentrating on the epidemiology of accidents, Dr. Haddon examined both ends of the spectrum of drinking. He showed that levels of blood alcohol under 50 mgm% may be shown to lead to "over-representation in the accidents of the population and risk." There was also a direct correlation between the increase in blood alcohol concentration and the number of accidents.

In a study of 433 Toronto drivers in evening accidents compared with a control group obtained by stopping four or more drivers passing the scene in cars of the same vintage, Lucas et al had found concentrations in the 150 mgm% or over range, eight times as common in the accident group as in the non-accident involved group. This and other studies refute the widely quoted premise that intoxication is in some way accident preventive.

Tolerance to alcohol as found in alcoholics was no safeguard against accidents. In a Swedish study alcohol "misusers" (alcohol addicts, alcohol abusers, and execessive drinkers, as defined by Swedish law), each of whom would under certain situations fill the American definition of alcoholics, accounted for 70% of accidents where alcohol was involved. The heaviest users (and presumably the most tolerant) alone accounted for 48% of the alcohol-involved accidents despite their comprising only 3-5% of the population at risk.

Dr. Haddon concluded that epidemiological studies on traffic accidents would inevitably draw attention to alcoholism as a problem more basic than this particular one of its by-products. He further considered that the medical profession, which is the one profession that can deal with alcohol problems, should be closely involved in accident research and prevention.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

Immunization Project Grant

The Maryland State Department of Health has received a one-year grant of $158,922 from the Public Health Service under the Vaccination Assistance Act, to be used in the organization and administration of the Health Department's immunization project in Maryland counties.

This is an important step toward eradication of the common childhood diseases throughout the state: diphtheria, whooping cough, poliomyelitis, smallpox, tetanus, and measles. Primary objective is the immunization of all preschool children who have not already been vaccinated.

The first phase of the project will be an attack on measles. The Health Department plan has been endorsed by the Medical and Chirurgical Faculty of Maryland.

Dr. Whitridge Retires

John Whitridge, Jr., MD, who recently retired from the State Health Department, was employed as the department's first fulltime obstetrical consultant in 1945. He later became chief of the Division of Maternal and Child Health, and in 1956 was appointed chief of the Bureau of Preventive Medicine. Dr. Whitridge was instrumental in developing many programs to protect public health in the state and was largely responsible for the extensive growth of services in the bureau which he headed for the past 10 years.

Pamphlet on Department's Services

A pamphlet entitled "An Overview of Public Health Services in Maryland" has been published as part of an effort to help the public learn more about the activities of their health department. It was designed especially for use by school children, who are often required to study the functions of the department as part of such courses as health, social studies, and civics.

Montebello Accredited

Montebello State Hospital has been accredited by the Joint Commission on Accreditation of Hospitals for a period of three years, or until a subsequent survey is conducted.

Physical and Occupational Therapy Courses

The Divisions of Physical and Occupational Therapy presented a four-day course, "The Consultative Process," for occupational and physical therapists. The purpose of the course, developed by Cornell University under a short term training grant from HEW, is to improve the quality of consultative services being rendered by therapists working with staffs of hospitals, nursing homes, and community agencies.

With the increased numbers of chronically ill and disabled persons and the potential of rehabilitating these people, there has resulted a growing demand for therapists to serve in the consultant capacity within their respective facilities. Hopefully, the course will enable therapists to greatly increase the scope of their services and to extend them to a greater number of patients.

Moving UP . . .

As the busy professional man's practice moves up, his need for proper tax records increases.

More and more professional men recognize the value of Federated's accurate, out-of-office Bookkeeping and Tax services and appreciate the savings in office time and expense.

Participants represented a broad range of facilities and health agencies throughout the state.

Communicable Disease Training Course

As a result of the increased incidence of Rocky Mountain spotted fever and in anticipation of possible mosquito-borne encephalitis cases during the coming months, the Division of Communicable Diseases organized a one-day rapid training course in the techniques for investigating these two insect-borne diseases. The course was conducted in Baltimore as a service of the Public Health Service's Communicable Disease Center without cost to the department. It consisted of short lectures on the principles of disease investigation, serology, statistical procedures, field methods, and measurement of animal population.

Laboratory Diagnosis of Tuberculosis

The culturing of sputum and other body fluids continues to be important in the diagnosis and management of tuberculosis, and analysis is growing more complex. Of the 20,000 specimens a year examined in the department's laboratories, 3.6 to 4% are positive for tubercle bacilli. In addition, 1 to 2% are positive for organisms resembling the tubercle bacillus. These atypical organisms may belong to various groups. Increased knowledge of the diseases they may cause has required more exacting procedures for identification.

Cultures positive for tubercle bacilli are tested for the susceptibility of the organism to the three drugs most commonly effective in treatment. The Baltimore City laboratory is making a study to determine susceptibility of the organisms to some of the experimental or secondary drugs.

"I like Bronkometer... I breathe better... don't get the jitters."

Patients feel relaxed with Bronkometer. Its bronchodilator-decongestant action has minimal central nervous system stimulation.[1] Isoetharine,* Breon's exclusive bronchodilator, shows only 1/16 to 1/64 the cardiotonic effect of isoproterenol.[2] *Dilabron®, brand of isoetharine

BRONKOMETER® ASTHMA, CHRONIC BRONCHITIS, EMPHYSEMA

isoetharine 0.6%; phenylephrine 0.125%; thenyldiamine 0.05%—Superior because it contains isoetharine

COMPOSITION: Bronkometer delivers at the mouthpiece 200 metered doses of: 350 mcg isoetharine methanesulfonate (0.6%); 70 mcg phenylephrine HCl (0.125%); and 30 mcg thenyldiamine HCl (0.05%) with saccharin, menthol and fluorochlorohydrocarbons as inert propellants. Preserved with ascorbic acid 0.1% and alcohol 30%.

RECOMMENDED DOSAGE: One or two inhalations with at least one minute between inhalations. Occasionally more may be required, however in most cases, inhalations need not be repeated more than every four hours. Dosage should be adjusted to the severity of the condition and to patient's response.

PRECAUTIONS: Bronkometer is unusually free from cardiovascular and other side effects, but the usual precautions associated with sympathomimetic amines should be observed. Bronkometer should not be administered simultaneously with epinephrine or similar compounds because of the possibility of tachycardia, although it may be alternated with these agents. Dosage must be carefully adjusted in patients with hyperthyroidism, hypertension, acute coronary disease, cardiac asthma, limited cardiac reserve and in individuals sensitive to sympathomimetic amines.

SUPPLIED: 10 ml pressurized aerosol vials complete with measured dose valve and oral nebulizer.

new from Ames
5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction

...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

Learn To Do Your Part In The Prevention Of Disease

Midyear Analysis

The following midyear analysis of Baltimore's health was prepared by Dr. Matthew Tayback, deputy commissioner of health for Baltimore City.

Diseases for which a specific preventive agent exists, namely, diphtheria, tetanus, and whooping cough, are firmly under control. Results of continuing surveys by the department's Bureau of Biostatistics indicate that the immunization status of children against these diseases and against poliomyelitis is at a high level.

Measles occurred in epidemic proportions in the inner city during the first half of the year. There is absolutely no need for a recurrence of such an outbreak. Every preschool child between 1 and 6 years old who has not had measles should be vaccinated, if he has not already been. Physicians may refer medically indigent children to City Health Department inoculation clinics.

Tuberculosis, a chronic communicable disease, continues to defy every effort to reduce its incidence. During the first half of 1966, the number of new active cases was 354, no significant change from the same period last year. Although such a comparison appears to suggest no improvement at all, we have additional information to indicate that progress is being made in preventing transmission of the infection to children. This is a first and necessary step in making a fundamental impact upon the future of the disease in this city.

Among the causes of death, we note that the first half of 1966 produced a 27% rise in deaths from pneumonia and influenza as contrasted with 1965. This was due to a substantially higher level of acute respiratory disease in the first three months of the year than we customarily experience. In this respect, developments leading to increasingly more effective influenza vaccines should help reduce the number of severe episodes of this disease.

It is unfortunate that this year, to date, we are experiencing an increase in each of the causes of accidental death and in deaths from homicide and suicide. Of particular concern is the 100% rise in deaths due to homicide during the first six months of 1966, as contrasted with the like period for 1965. The ease with which people in the city can secure small arms is probably one of the reasons underlying this problem.

On the brighter side, we have further evidence of the success of the planned parenthood services, which have been substantially expanded in the past two years. The number of births for the first

For Safe, Sure, Speedy Relief— —Get RESINOL GREASELESS!

Medical Scientists have conquered 6 dread diseases in the past decade, but they are largely in the dark, they admit, in finding relief for one age-old ailment—itching

New remedies containing antibiotics have been tested, but have often caused side effects which are worse than itching skin. After many years of research and testing, **Resinol Greaseless Cream** was developed. . . . A doctor's formula containing safe yet powerful ingredients. **Resinol Greaseless** contains an amazing, proven "anti-itch" medication called Resorcin, which quickly and effectively relieves most any kind of itching. Try **Resinol Greaseless** . . . You'll be delighted to find that it really works! At all drug stores. Buy a tube today.

Baltimore, Md. 21201

six months is down 5% from 1965. When one considers that births in 1965 dropped 10% from 1964, the total effect is remarkable. Analysis carried out by the Bureau of Biostatistics indicates that mothers in low socioeconomic circumstances are experiencing the full benefit of these new services.

The difference in mortality between white and nonwhite infants is a matter of concern. The basic issue is one of social and economic opportunity; however, we are attacking this problem by several new medical services, including our Maternity and Infant Services Project, with headquarters in the Baltimore Maternity Center, 211 W Lombard Street.

Medical Care Program

Physicians have been notified that beginning July 1, 1966, the Baltimore City Medical Care Program began operating under regulations governing all other sections of Maryland, in view of the fact that city and county programs have been unified to obtain funds under Title XIX of Public Law 89-97.

Patients may now go to any physician who will accept them and may seek help in any hospital of the city or county. Physicians will be paid on a set fee-for-service, whereas hospitals will receive their costs as certified by a hospital cost-accounting service. The Department of Public Welfare will certify the eligibility of all persons requesting medical care under this program and will issue all new medical care cards.

Physicians will receive copies of the regulations pertaining to this new program as they become available.

Requirements for Communicable Diseases

A new communicable disease chart delineating the requirements for communicable diseases is available from the Bureau of Communicable Diseases in the Baltimore City Health Department, telephone PLaza 2-2000, extension 314.

The chart, which is Regulation 2 for the control of communicable diseases, was adopted and amended effective April 1, 1966. It describes the various communicable diseases, gives the common early signs and symptoms, and lists the isolation requirements for patients and contacts.

Usually works within 3 to 4 days in osteoarthritis

The trial period need not exceed 1 week. In contrast, the recommended trial period for indomethacin is *at least 1 month.*

That's why it's logical to start therapy with Butazolidin alka—you'll know quickly whether or not it works. And usually, it will.

A large number of investigators have reported major improvement in about 75% of cases. Some patients have gone into remission. Relief of stiffness and pain may be followed quickly by improved function and resolution of other signs of inflammation. And Butazolidin alka is well tolerated, especially since it contains antacids and an antispasmodic to minimize gastric upset.

Contraindications
Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. Because of the increased possibility of toxic reactions, the drug should be used with greater care in the elderly and should not be given when the patient is senile or when other potent chemotherapeutic agents are given concurrently. Large doses of Butazolidin alka are contraindicated in patients with glaucoma.

Warning
If coumarin-type anticoagulants are given simultaneously, the physician should watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Patients receiving such concomitant therapy should be carefully observed for this effect.

Use with caution in the first trimester of pregnancy.

Precautions
Before prescribing, the physician should obtain a detailed history and perform a complete physical and laboratory examination, including a blood count. The patient should be kept under close supervision and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Regular blood counts should be made to guard against blood dyscrasias.

Adverse Reactions
The most common adverse reactions are nausea, edema and drug rash. Moderately lowered red cell count may sometimes occur due to hemodilution. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vertigo or languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia are also possible side effects.

Confusional states, hyperglycemia, agitation, headache, blurred vision, optic neuritis and transient hearing loss have been reported, as have hepatitis, jaundice and several cases of anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently.

Dosage
The initial daily dosage in adults is 300-600 mg. daily in divided doses. In most instances, 400 mg. daily is sufficient. When improvement occurs, dosage should be decreased to the minimum effective level: this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

For complete details, please refer to full prescribing information.

Fact Sheet for 1966 Fiscal Year

In 1966, for the seventh year in a row, Maryland's hospitals for the mentally ill treated a record number of patients, reflecting the continuing rise in admissions. Despite a gradual decrease in the number of long term patients and in the length of hospitalization of those newly admitted, the average size of the patient population increased for the second consecutive year. This is counter to the nationwide experience of a small but persistent annual decline. Data for Maryland are summarized in the Table.

FISCAL YEAR	AVERAGE SIZE OF PATIENT POPULATION	TOTAL NUMBER TREATED DURING YEAR	ADMISSIONS	TOTAL SEPARATIONS
1956	9,530	15,477	3,785	3,349
1958	9,147	16,197	4,015	4,412
1960	8,576	16,268	4,640	4,751
1962	8,291	17,580	6,221	6,111
1964	8,035	19,424	7,871	8,104
1965	8,102	21,542	9,675	9,735
Net Change	—1,428	+6,065	+5,890	+6,386
Percentage Change	—15.0	+39.2	+155.6	+190.7

The continuing rise in the number of mentally ill patients treated annually primarily reflects the rapid expansion in admissions. The 9,675 patients admitted during 1966 represented an increase of 1,124, or 13.1%, over the previous year's comparable figure; this in turn reflected an increase of 680, or 8.6%, over the 1964 figure.

A similar rise in admissions has been noted in most states. Because of this, the question is frequently posed whether this indicates a rising incidence of mental illness. This can not be readily answered since the numeric relationship between the number of hospitalized patients and the total number of mentally disturbed or ill cannot be determined. However, it is generally believed that the incidence rate of most mental illnesses has not changed appreciably and that these expanding figures therefore reflect mainly the growing acceptance and usage of mental hospitals as short term intensive treatment facilities for alcoholism and acute psychoneurotic and personality disturbances.

Substantial overcrowding continued also at Rosewood, Maryland's major hospital for the mentally retarded. It therefore persisted in its policy of relating the number of admissions to available space and staff. Despite this restrictive policy, the average number of retarded patients at Rosewood and Henryton increased 187 to 2,888.

Ten years ago, prior to the opening of Henryton, Rosewood had a patient population of 1,723. In an effort to reduce this chronic problem, the Department is engaged in a three-pronged program involving the construction of additional buildings at Rosewood, the establishment of new facilities in the Baltimore and Washington metropolitan areas, and the development, with the Health Department, of coordinated community based services as alternatives to hospitalization.

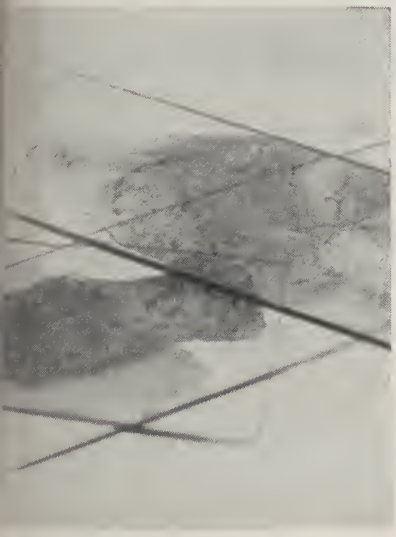
New
low-cost tetracycline/antifungal therapy

for broad-spectrum activity plus specific antifungal prophylaxis at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

1. ietic patients



2. nonpregnant women with a history of recent or recurrent monilial vaginitis

3. elderly or debilitated patients

ients with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete formation consult Official Package Circular. *Indication* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

Tetrex-F®

ach capsule contains tetracycline phosphate complex equivalent to tetracycline hydrochloride 250 mg. and nystatin 250,000 units.

Tetrex-F is priced lower than most tetracycline-antifungal products.

Solutions to Business Problems in Daily Medical Practice

Collection Routine

Part I: Accounts Receivable Management

WILBURN L. McCLURE, JR.

When a patient opens the door to your office, the accounts receivable routine begins. It climaxes as the patient prepares to leave.

As distasteful as the task of maintaining financial records and collecting money may be, it is, nevertheless, a vital part of your responsibility to the patient.

Patients seldom will attack your ability as a physician, but with little hesitation many are eager to discredit your standing as a businessman.

Now is as good a time as any to sit down in the business office with your aide and evaluate these questions:

> Do I have comprehensive accounts receivable records?
>
> Do I make it easy for patients to understand their financial obligation to me?
>
> Is the collection approach working?
> Is the billing system adequate and efficient?

The following recommendations should constitute the vast part of the management of your accounts receivable routine. Extend and revise to suit your office, but try to include the following basic ideas.

Access to aides: An aide must be strategically located to greet each patient. Ideally, the aide should be able to interview each patient privately or, as the case may be, to review and update present information.

Accurate records: Each patient's financial record should reveal the following: the patient's full name (emphasis on correct spelling); who is to be billed, if other than the patient; complete billing address, including house number, apartment number (if any), street, city, state, and zip code; telephone number, including any extension numbers and area code; place of employment (if housewife or dependent, include such information on husband), including phone number and extension.

It is also important to include the insurance company's full name, address, phone number, policy number, and name of insured as it appears on the policy.

Fee discussions: The major step toward an understanding between doctor and patient, in the financial sense, begins with a frank discussion of fees necessary for services rendered. Since your fees are not overtly labeled, you cannot take for granted that a patient will accept or understand every fee charged. Have a fee schedule handy.

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

The meaningful pause. The energy it gives. The bright little lift. Coca-Cola with its never too sweet taste, refreshes best. Helps people meet the stress of the busy hours. This is why we say **things go better with Coke**
TRADE-MARK ®

Most important, encourage your patients to discuss fees with you *rather than with your aide.*

Intra-office communications: Once you have discussed your fees with the patient, how do you relay the information to the aide? Before seeing a patient, how can you be advised about a delinquent account or one which is approaching the too high mark?

A charge or service slip generally fits the need. A well designed one has a place for the date, patient's name, and a list of services generally rendered, with extra lines for special cases. It also has a special area for previous balance due (if any), amount of today's services, subtotal, today's payments (if any), and the current balance.

The doctor enters his fees, and the slip is returned to the aide for completion. Complete details on one such system are available without charge from the author upon request.

Collection approach: Equally as important as greeting the patient is the availability of an aide as the patient prepares to leave the office. This way she has the opportunity of making the patient's next appointment and collecting your fees.

The aide must be able to quickly summarize the account and arrive at the current balance due. Then she needs but two remarks for her collection repertoire: "That will be_____dollars for today's visit," and, "Your current balance is_____ dollars." No alternatives. No options. Just facts.

Billing system: All account cards must be accurate and complete before each billing period. Ledger cards fully itemized are the most desirable. Always itemize charges for surgical procedures, lab fees, x-rays, electrocardiograms, injections, and drugs dispensed. Send your bills promptly at the same time each month. Delays will offer the patient an excuse that he "did not get it on time."

So far, accurate record keeping, fee discussions, collection and billing techniques have been discussed. What, then, should you do about delinquent accounts? Read next month's column, "Collection Routine, Part II, Using Intra-office Techniques."

MOLECULAR REMODELING—

laboratory exercise or clinical necessity?

More than twenty-five years have passed since the discovery of the diuretic activity of sulfanilamide started pharmacologists on a succession of molecular remodelings to find the ideal diuretic.

Diuresis—a sought-after clinical effect from an unwanted side effect

It started in 1937 when a clinician reported that the administration of a sulfonamide was sometimes accompanied by an unexplainable side effect—metabolic acidosis.[1] Three years later the side effect was explained. The sulfonamide radical of sulfanilamide inhibited carbonic anhydrase,[2] the enzyme responsible for converting carbon dioxide and water to hydrogen ions and bicarbonate ions.

Later, other investigators showed by dog experiments that metabolic acidosis probably resulted when the inhibition of carbonic anhydrase upset the exchange of hydrogen and sodium ions, causing increased excretion of sodium as the bicarbonate.[3]

It was twelve long years after the first report of the unexplainable side effect (metabolic acidosis) that it was finally shown that large doses of sulfanilamide administered to edematous patients were indeed capable of promoting diuresis.[4] However, the possibility of toxic effects from its prolonged use and its relatively weak diuretic action made it impractical for clinical use as a diuretic.[5]

Because the inhibition of carbonic anhydrase seemed to be the key to effective diuresis, investigators began to look for more potent enzyme inhibitors —in the hopes that they would be more effective diuretics.

The most important of these early compounds, acetazolamide, enjoyed several years of fairly wide clinical use.

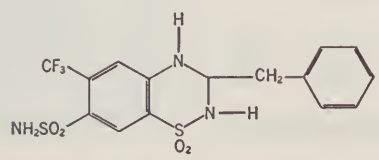
Its carbonic anhydrase inhibitory activity was several hundred times greater than that of sulfanilamide.[6] The increase in inhibitory activity, however, increased not only the excretion of sodium and bicarbonate ions, but also the excretion of potassium.[7] And, like its predecessor, acetazolamide precipitated mild acidosis. Its prolonged use could result in hypokalemic acidosis.[7]

The 'thiazides'—an answer to the metabolic acidosis caused by carbonic anhydrase inhibition

Despite the fact that the sulfonamide group appeared to be responsible for carbonic anhydrase inhibition which in turn appeared to be responsible for diuresis, investigators began to synthesize compounds with structural alterations to the sulfonamide group.

The first major breakthrough came with the synthesis of chlorothiazide. Altering the sulfonamide group did indeed alter the ability of chlorothiazide to inhibit carbonic anhydrase—it was only 1/10th as potent as acetazolamide in inhibiting the enzyme.[8] Despite the drop in inhibitory potency, however, chlorothiazide proved to be an effective diuretic—an observation that led to the conclusion that its diuretic action was due to some mechanism other than its action on carbonic anhydrase.[9,10]

For effective diuresis, chlorothiazide was administered in daily dosages ranging from 250 to 2000 mg.[11] It increased the excretion of sodium and chloride; and, to a lesser extent, potassium and bicarbonate.[11] The excretion of potassium appeared to be maximal at higher dose levels at which, theoretically, the carbonic anhydrase inhibitory effect is more active.[11] Its prolonged use, therefore, could sometimes result in metabolic hypokalemic, hypochloremic alkalosis.[7]



Naturetin—effective diuresis with more favorable electrolyte balance

Other thiazides followed—with improvements being aimed at two particular areas: 1. attempts to increase diuretic action in relation to the milligram potency of the drug, and 2. attempts at a more favorable sodium/potassium ratio in the urine, i.e., to decrease the excretion of potassium while maintaining the excretion of sodium.[12]

One of these, Naturetin, Squibb Bendroflumethiazide, has made advances on both these points. "By adding a 3-benzyl radical to hydroflumethiazide a rather dramatic reduction in dose range is accomplished. With this drug, effective sodium excretion is obtained with doses between 2.5 and 10 mg., which is a 200 to 1 ratio as compared to chlorothiazide..."[13]

Moreover, due probably to its virtual lack of carbonic anhydrase inhibition, Naturetin (bendroflumethiazide) has been shown to cause less potassium and bicarbonate loss and less alteration in urinary pH than either chlorothiazide or hydrochlorothiazide.

Naturetin is outstandingly effective not only in establishing, but also in maintaining, excretion of retained fluid in edematous patients. And its duration of action is sufficiently prolonged to allow a single daily administration in most patients. Naturetin is also an effective antihypertensive agent.

Contraindications: Severe renal impairment; previous hypersensitivity.

Warning: Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting, or G.I. bleeding occur.

Precautions: The dosage of ganglionic blocking agents, veratrum, or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Electrolyte disturbances are possible in cirrhotic or digitalized patients.

Side Effects: Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, and rashes may occur.

Supplied: Naturetin (Squibb Bendroflumethiazide) 5 mg. and 2.5 mg. tablets. Also available Naturetin c K [Squibb Bendroflumethiazide (5 or 2.5 mg.) with Potassium Chloride (500 mg.)]. For full information, see Product Brief.

Woman's Auxiliary
MARYLAND
HYGEIA FILIAE
W A M C F

SEPTEMBER, 1966

INAUGURAL ADDRESS

MRS. ARCHIE R. COHEN
President, 1966-1967

Read at the annual meeting, Woman's Auxiliary to the Medical and Chirurgical Faculty, April 28, 1966.

In this springtime of the year, God does make all things new in the world of nature. So does our organization, the Woman's Auxiliary to the Medical and Chirurgical Faculty of the State of Maryland, annually assign new names to title its leadership.

To the best of the past and mix it with the good of the new, your new officers will serve you the best of today, with hopes that for the tomorrow we will be able to do even better.

Working with Mrs. Strobel has been most gratifying this past year. Through her tireless enthusiasm and efforts, I have been filled with hope and confidence.

In accepting the responsibility of leadership, I have the staunch support and aid of, first, my husband, Archie, and then, hand in hand, with the past officers and all members from throughout the state and the Washington County girls and the new board, all of whom are devoted to Auxiliary work; and I feel assured of cooperation from every corner.

My aim will be first, to fulfill the objectives of the Auxiliary, whose principal purpose is to encourage and advance public understanding and education concerning matters of public health as approved by the Medical and Chirurgical Faculty.

Our motto, "Hygeia filiae," handmaidens to health, proclaims us to be helpers. We can develop greater understanding and interest in problems our husbands face when we work together for health education, research, future medical careers, and community service.

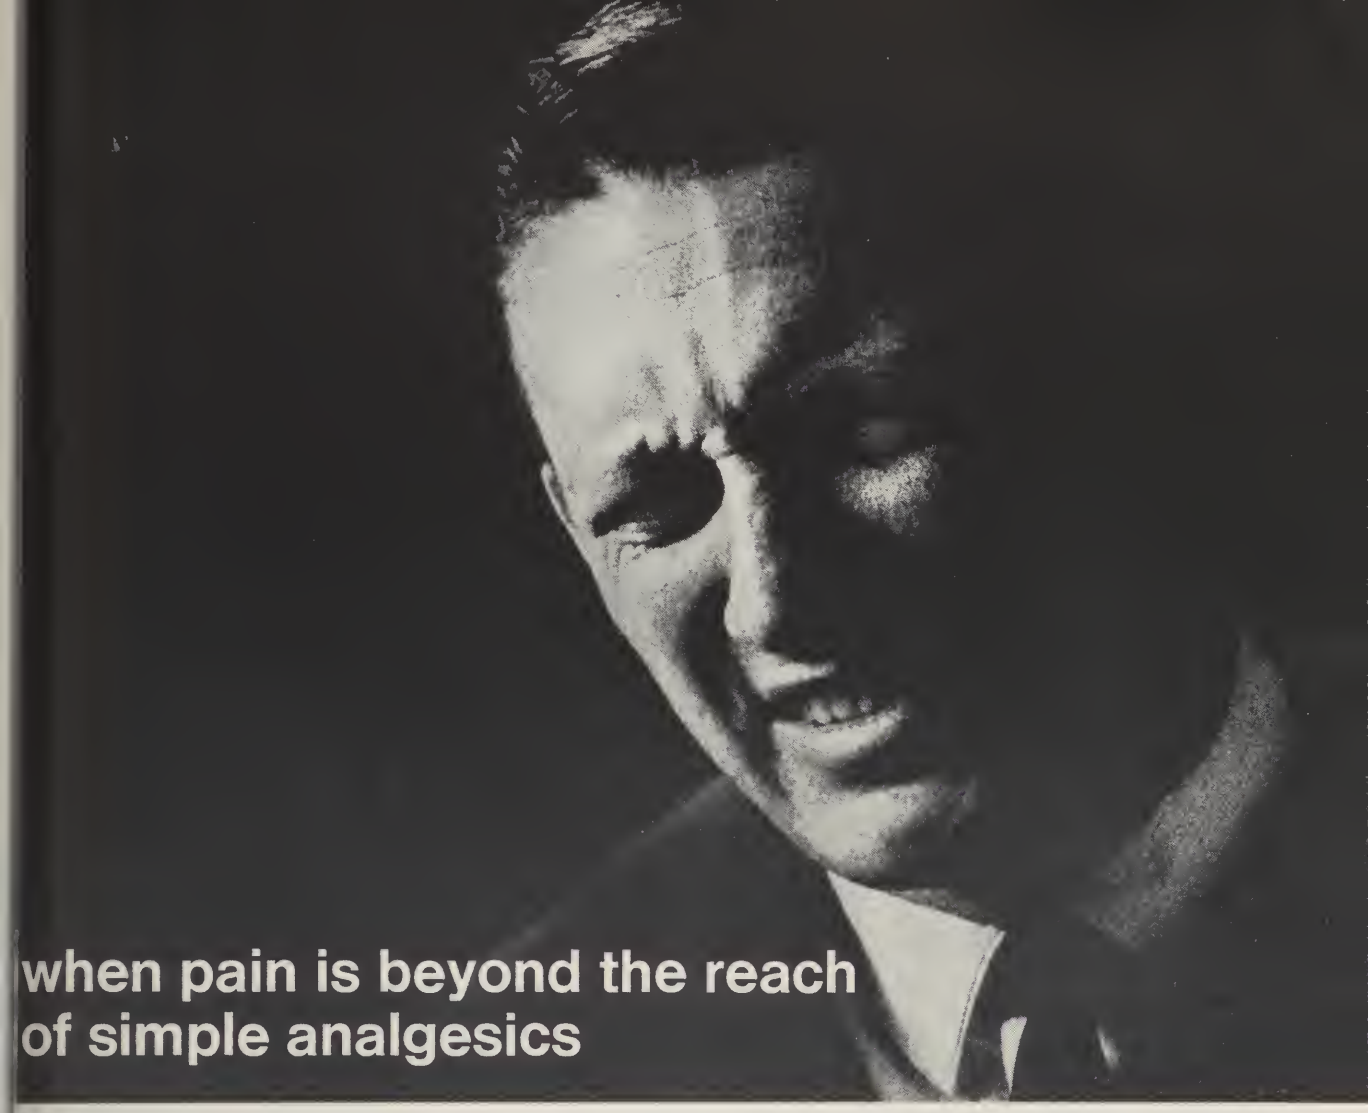
This year ahead will be one of challenge, one of change in medical practice, and we must prom-

ise to keep informed so we may be correctly tuned to the questions that come our way. Let us keep our answers a tribute to the medical profession.

Legislation, community service, mental health, all give us the impetus to reserve a moment daily for education. Listen, learn, and remember the important facts that are changing daily, throughout the neighborhood, the state, and the nation.

We shall try very hard to keep smiling, and keep promoting better health, through safety and through research. Let us take with us this short quote: "To whom much is given much is required." I will give my best, and together we will serve and accomplish.

Maryland Auxiliary Gets AMA-ERF Merit Award



L-R: Mrs. John E. Baybutt, Mrs. Wallace H. Sadowsky, and Mrs. Archie R. Cohen.

The Woman's Auxiliary to the American Medical Association set another record in its annual contribution to the AMA Educational and Research Foundation—$345,573.81.

For its contribution of $5,892.72, the Maryland Auxiliary won an award of merit. Merit awards are presented to the auxiliary raising the largest amount in each of six membership categories.

Said Raymond L. McKeown, AMA-ERF president:

> Your support literally has known no bounds, for each year you have raised and contributed more than the year before. . . . The women in our auxiliaries indeed are becoming a more important resource each year for AMA-ERF funds and for dissemination of information on the programs of the Foundation.

when pain is beyond the reach of simple analgesics

In the management of mild to moderate pain, give your patients comprehensive relief. TRANCO-GESIC extends the range of usefulness of aspirin by dimming pain perception—and *also* reducing mental and muscle tension.

TRANCO-GESIC®

tablets

chlormezanone 100 mg. with aspirin 300 mg.

subdues the major contributors to pain:

- pain perception
- mental tension
- muscle tension-spasm

TRANCO-GESIC is so well tolerated it can be prescribed for anyone who can take aspirin. It is non-narcotic, and free from dangers of addiction, habituation, or dependence. TRANCO-GESIC is effective in all types of mild and moderate pain. Of 862 patients who were treated with chlormezanone and aspirin for various disorders, 88% reported excellent or good pain relief.[1]

Side effects have been minor. Occasionally gastric distress, weakness, sedation or dizziness occur. Reversible cholestatic jaundice has been reported on rare occasions. However, in 4,653 patients treated with chlormezanone, 97.7% had *no* side effects.[1] *Contraindication:* just one: sensitivity to aspirin. *Dosage:* Adults, usually 2 tablets three or four times daily. Children (from 5 to 12 years), 1 tablet three or four times daily.

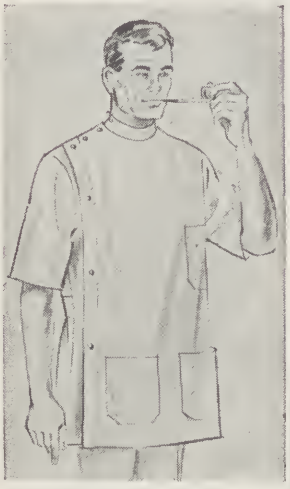
ATTENTION
MEDICAL SECRETARIES
MEDICAL ASSISTANTS
MEDICAL AIDES

DID YOU KNOW THAT . . . If you are employed by or working under the direct supervision of a Doctor of Medicine, you are entitled to the privilege of a membership in the *only* organization for Medical Assistants, which is wholeheartedly endorsed by AMA? We are known as the

AMERICAN ASSOCIATION OF MEDICAL ASSISTANTS
AAMA
or locally
MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS
MAMA

DID YOU KNOW THAT . . . You may participate, possibly in a local group? If none exists in your area, come and join us in Baltimore, Cumberland, or Salisbury. We have a national membership of 12,000. We are growing. You may initiate interest in your own home town. That's how we got started—with people like YOU, who wanted to expand themselves with the ever-growing field of medical knowledge. You can avail yourself of outstanding programs offered to help the medical assistant in the self-improvement of her career.

DID YOU KNOW THAT . . . AAMA membership offers medical and civic programs pertinent of our profession and the community? Annually you may participate in an educational seminar and a national convention of the AAMA (this year to be held in St. Louis). You are offered educational courses to help you prepare for the certification examination of AAMA. A group insurance plan is made available through the Raymond K. Tongue Company, among other plans offered by AAMA.



DID YOU KNOW THAT . . . AAMA dues are only $10 a year (tax deductible)? This includes membership in both the MAMA and your local organization. Only members are permitted to purchase AAMA pins. Along with your membership goes a subscription to the *Bulletin* published by the AAMA.

DID YOU KNOW THAT . . . The AAMA was organized in Milwaukee in October, 1956, with members of the American Medical Association in attendance? In November, 1956, the House of Delegates of AMA passed a resolution commending the objectives of the AAMA. In 1962, the House of Delegates of the AMA passed a resolution which wholeheartedly endorsed our program and encouraged all physicians employing medical assistants to urge them not only

When uncontrolled diarrhea brings a call for help

When the diarrhea sufferer has run the gamut of home remedies without success, pleasant-tasting CREMOMYCIN can answer the call for help. It can be counted on to consolidate fluid stools, soothe intestinal inflammation, inhibit enteric pathogens, and detoxify putrefactive materials — usually within a few hours.

CREMOMYCIN combines the bacteriostatic agents, succinylsulfathiazole and neomycin, with the adsorbent and protective demulcents, kaolin and pectin, for comprehensive control of diarrhea.

INDICATIONS: Diarrhea.

CONTRAINDICATIONS: Do not use in intestinal obstruction, extensive ulceration of bowel, or diverticulosis; in hypersensitivity to sulfonamides or neomycin; in pregnancy at term, in premature infants, or during first week of life in the newborn.

WARNINGS: Use only after critical appraisal in patients with hepatic or renal damage, urinary obstruction, or blood dyscrasias. Fatal hypersensitivity reactions and blood dyscrasias reported with use of sulfonamides. Consider periodic blood counts, hepatic and renal function tests during intermittent or chronic use.

PRECAUTIONS: Succinylsulfathiazole: Use with caution if there is history of significant allergies and/or asthma. Continued use requires supplementary vitamins B_1 and K. *Neomycin:* Watch for

your ℞ for Cremomycin can provide relief

curare-like neuromuscular block during anesthesia if neomycin is used preoperatively in large doses when renal function is poor; watch for overgrowth of nonsusceptible organisms. Consider possibility of ototoxicity and nephrotoxicity with prolonged high dosage.

SIDE EFFECTS: As with all sulfonamides: Headache, malaise, anorexia, G.I. symptoms, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, rash, conjunctival and scleral injection, petechiae, purpura, hematuria, and crystalluria have been noted. Reduced fecal output of thiamine and decreased synthesis of vitamin K have been reported. *Neomycin:* Nausea, loose stools.

Before prescribing or administering, read package circular with product or available on request.

promptly relieves diarrheal distress

Cremomycin®

ANTIDIARRHEAL

Composition: Each 30 cc. contains neomycin sulfate 300 mg. (equivalent to 210 mg. of neomycin base), succinylsulfathiazole 3.0 Gm., colloidal kaolin 3.0 Gm., pectin 0.27 Gm.

Book Reviews

FERMENT IN MEDICINE, by Richard M. Magraw, MD. Saunders, 1966. $6.50

The changing needs and patterns of medical care and practice have furnished the basis for this book. Its purposes are twofold: 1) to analyze and define those elements in traditional forms of medical practice which are essential to optimal medical care and maintenance of health for everyone; 2) to describe and discuss some of the major forces now acting to modify existing concepts, practice, and institutions in medicine.

BLOOD DISEASES OF INFANCY AND CHILDHOOD, ed 2, by Carl H. Smith, MD, C. V. Mosby Co., 1966. $22

Recent advances in pediatric hematology are introduced in this edition. Selection of material has been based on that which would interest the practitioner and contribute toward diagnosis and treatment.

SPONTANEOUS REGRESSION OF CANCER, by Tilden C. Everson, MD, and Warren H. Cole, MD, W. B. Saunders Co., 1966.

With the thought that isolated "cures" of cancer from unorthodox therapeutic measures might actually be spontaneous regressions of cancer, the authors reviewed the world medical literature since 1900 for evidence both supporting and refuting their theory. Added to this accumulation of data were many personal communications relating unpublished cases of cancer in which there was evidence of biologic control, as well as information concerning spontaneous regression of benign tumors, prolonged arrest of cancer after no treatment or inadequate treatment, and delayed recurrence or delayed metastasis of cancer after treatment of the primary cancer.

This monograph reports the results of their study. Their findings for each of the various types of cancer are illustrated by cases which the authors considered to be possible examples of spontaneous regression of cancer.

BIOMECHANICS AND RELATED BIO-ENGINEERING TOPICS, edited by R. M. Kenedi, Pergamon Press, 1965. $20

This book contains a selection of papers presented at a symposium held in Glasgow. The purpose of the symposium was to promote correlation between the contributions made by different disciplines in relation to the various problems studied. Among the topics covered are developments in surgical and laboratory instrumentation, diagnostic applications of ultrasound, and telemetering techniques.

OPERABLE HEART DISEASE, by Howard D. Sirak, MD, C. P. Mosby Co., 1966. $12.50

This book is intended as a guide to understanding the basic problems in anatomy and physiology as applied to the diagnosis and treatment of heart disease. Directed toward students and specialists in training, it demonstrates the need for a sound background in circulatory and respiratory physiology in the interpretation of electrocardiograms and data from cardiac catheterization and in evaluating the circulatory dynamics, respiratory changes, and metabolic considerations of the postoperative period.

RESUSCITATION OF THE NEWBORN INFANT, ed 2, edited by Harold Abramson, MD, C. V. Mosby, 1966. $16.50

Since publication of the first edition of this work, interest has surged in neonatology and problems related to the dynamics of respiration and circulation of newborn infants. Many new solutions have been found, and these are incorporated in this new edition.

Rapid establishment of the respiratory mechanism is only the first step in resuscitation. Early diagnosis of the underlying cause and institution of therapy to assure continued survival are likewise necessary.

This edition, like its predecessor, has been prepared by the Special Committee on Infant Mortality of the County of New York.

THE PEDIATRICIAN'S OPHTHALMOLOGY, edited by Sumner D. Liebman, MD, and Sydney S. Gellis, MD, C. V. Mosby, 1966. $19.50

Through the collaboration of an ophthalmologist and a pediatrician, material most needed by the pediatrician has been selected and translated into terms understandable to the pediatrician and the general practitioner. It is designed to help these physicians recognize eye disorders of childhood, particularly in the young infant. The editors have attempted to make each chapter as complete as possible, anticipating that the reader would turn to a particular chapter for reference rather than reading the book from cover to cover.

OSTEOTOMY AT THE UPPER END OF THE FEMUR, by Henry Milch, MD; edited by Robert A. Milch, MD, Williams & Wilkins, 1965. $11.25

The choice between the various types of osteotomy should be made upon consideration of the change each accomplishes in the effective axis of the bone. In the author's opinion, too much concern over the details of technique has beclouded the wider significance of osteotomy as a "solution of continuity." Proper evaluation of the consequences of such solutions of continuity, whether induced surgically or accidentally, presuppose a concept of the action of the femoral neck and of the limits of motion possible at the hip joint. The author bases his monograph on 40 years of experience.

Dr. Henry Milch completed this monograph just a few hours before his death, on March 3, 1964. It was edited by his son and published as a tribute to the author and his works.

PRINCIPLES OF ORAL SURGERY (Pergamon Series in Dentistry, Vol 3), by J. R. Moore, Pergamon Press, 1966. $7.25

This is an introduction to oral surgery for dental students. It describes the operations on the teeth and jaws normally performed by the dental surgeon.

SYMPOSIUM ON SURGERY OF THE OCULAR ADNEXA, by the New Orleans Academy of Ophthalmology, C. V. Mosby Co., 1966. $16

This is a compilation of the lectures presented before the New Orleans Academy of Ophthalmology in February, 1965. Among the distinguished participants is Howard Naquin, MD, of Baltimore. The participants have discussed the pathogenesis and diagnosis of each condition and have described the treatment they have found most satisfactory.

ADVANCES IN BIOLOGY OF SKIN, Vol VI, AGING, edited by William Montagna. Pergamon Press, 1965. $15

"It is conceivable that under ideal circumstances tissues might remain unchanged in time and that animals could live forever."

With these striking words the editor commences his preface to this volume. But, he then points out, serious problems of survival would result and the pattern of nature is that neither tissues nor animals are indestructible. Aging processes in general are gradual and cumulative and progressive deterioration of the skin is one of the most obvious indications of human age.

Knowledge of aging skin has not advanced rapidly even though there has been considerable study of the subject. This volume has, therefore, a significant and valuable purpose. Containing the papers presented at the 14th Symposium on the Biology of Skin, held at the University of Oregon Medical School, it combines varied disciplines which have been used in the study of aging phenomena and focuses attention upon the skin. The contents of the volume cover studies in morphology, biochemistry, and physiology.

SYNOPSIS OF OBSTETRICS, ed 7, by Charles E. McLennan, MD, C. V. Mosby Co., 1966. $6.85

This is a pocket-sized, precise synopsis of obstetrics designed primarily for the undergraduate medical student. It continues to emphasize basic principles. This revision presents some newer information and has eliminated a great deal of information no longer pertinent.

ARTERIOGRAPHY, PRINCIPLES AND TECHNIQUES, EMPHASIZING ITS APPLICATION IN COMMUNITY HOSPITAL PRACTICE, by Joseph L. Curry, MD, and Willard J. Howland, MD, W. B. Saunders, 1966. $14

This book offers a brief introduction to arteriography for the community radiologist and other physicians who wish to initiate such procedures in their own hospitals. The material is based on the experience of the authors in a community hospital and represents the gradual evolution of techniques and the recognition of various problems as they were encountered in more than 1,200 arteriographic procedures.

Basic principles and techniques are emphasized.

Diet Control — **Appetite Control**

and now finally
. . . the neglected factor

Ex-Caloric Wafers *

Not marketed in combination with any anorexiant drug, since that would limit the dosage flexibility of both.

A SUBSTITUTE FOR FOOD

A DEVICE TO SATISFY THE HUNGER FOR BULK IN PATIENTS ON A REDUCING DIET.

Designed for bulk hunger . . . not laxation!

EX-CALORIC WAFERS CONTAIN NO LAXATIVE HEMICELLULOSE

DESCRIPTION:
Artificially sweetened and flavored. Each wafer contains 453 mg. of these non-nutritive, synthetic hydrophilic colloid bulking agents: carboxymethylcellulose 181 mg. and methylcellulose (400 centipoise type) 272 mg. Safe for use by diabetic patients placed on a restricted reducing diet. Usual daily intake less than 3 calories per day.

ACTION:
Ex-Caloric Wafers produce such bulk in a part of the alimentary tract as to ordinarily impart a highly satisfactory sense of fullness for those obese patients who complain of an empty feeling ("hollow hunger") when placed on a reducing diet and deprived of their between-meal snacks.

ADMINISTRATION:
3 or 4 wafers t.i.d., a.c. or p.c. or mid-morning, mid-afternoon and mid-evening. At least 1 large glass of water must be taken with each dose.

CONTRAINDICATIONS:
Ex-Caloric Wafers are completely innocuous and may be administered with impunity in any necessary quantities to all obese patients, including children and the aged. The only contraindications are acute ulcerative colitis and organic intestinal obstruction.

when anxiety is part of the clinical picture

Librium®
(chlordiazepoxide HCl)

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Warn against hazardous occupations requiring complete mental alertness. Use caution in administering to addiction-prone patients or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In elderly and debilitated and in children over five, limit dosage to smallest effective amount, increasing gradually as needed and tolerated. In general, concomitant use with other psychotropics is not recommended. Paradoxical reactions have been reported in psychiatric patients and hyperactive aggressive children. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Observe usual precautions in presence of impaired renal or hepatic function, impending depression and suicidal tendencies.

Adverse reactions: Drowsiness, ataxia and confusion may occur, especially in elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. Syncope occurs rarely. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis, jaundice and hepatic dysfunction) may develop occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy. Individual maintenance dosages should be determined.

Dosage: *Oral*—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Supplied: Capsules, 5 mg, 10 mg and 25 mg—bottles of 50.

OFFICIAL PUBLICATION OF THE MEDICAL AND CHIRURGICAL FACULTY OF THE STATE OF MARYLAND

some allergens are red...

whatever their color, shape, or size...

Benadryl®

(diphenhydramine hydrochloride)

PARKE-DAVIS

for control of allergic symptoms

Whether the allergen is red and round, or unseen and unknown, BENADRYL provides relief of symptomatic distress through its antihistaminic and antispasmodic actions. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with BENADRYL should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENADRYL. *SIDE EFFECTS:* Side reactions, commonly associated with antihistaminic therapy and generally mild, may affect the nervous, gastrointestinal, and cardiovascular systems. Most frequent reactions are drowsiness, dizziness, dryness of the mouth, nausea, and nervousness. BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00666

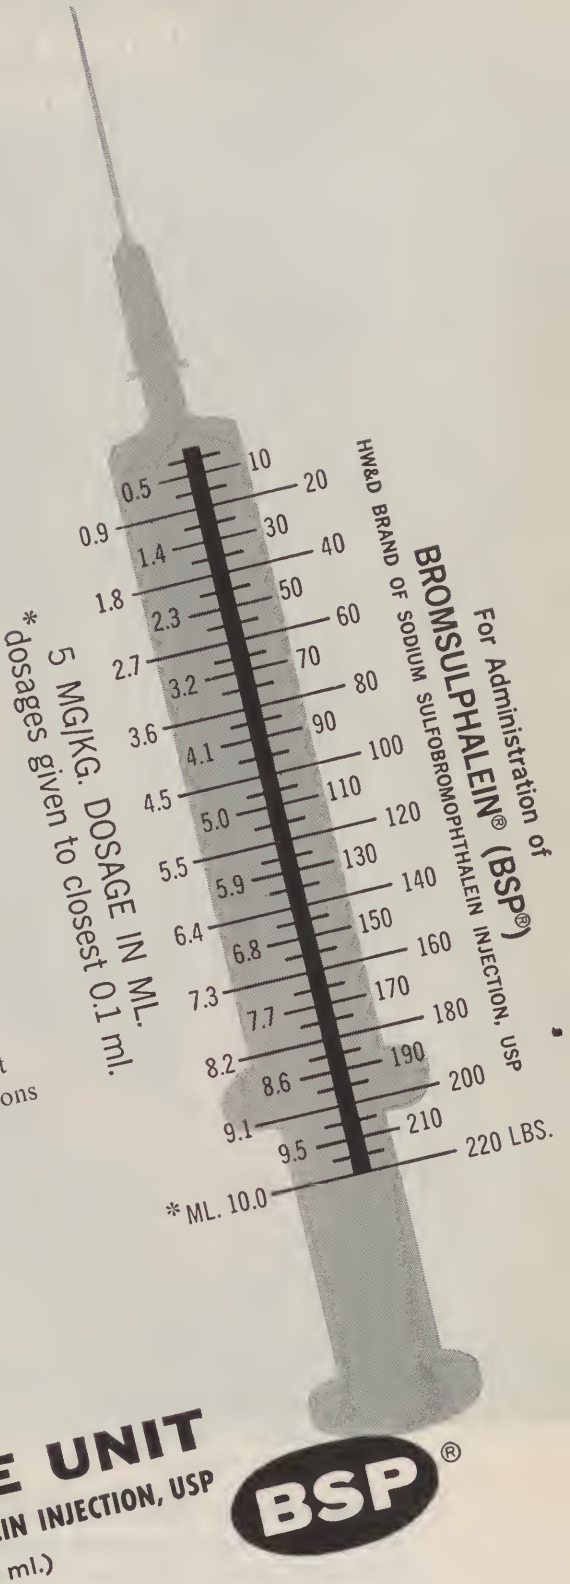
BSP® DISPOSABLE UNIT

A RELIABLE, PROVEN PRODUCT . . .

The BSP test, introduced in 1925, remains one of the most sensitive laboratory procedures available for determining hepatic function.



A STERILE, CONVENIENT PUT-UP . . .

Each BSP Disposable Unit contains: a sterile, glass, disposable syringe with the 5 mg./kg. BSP dosage schedule imprinted on the barrel, a sterile needle, alcohol swab and a 7.5 ml. or 10 ml. size ampule of Bromsulphalein.

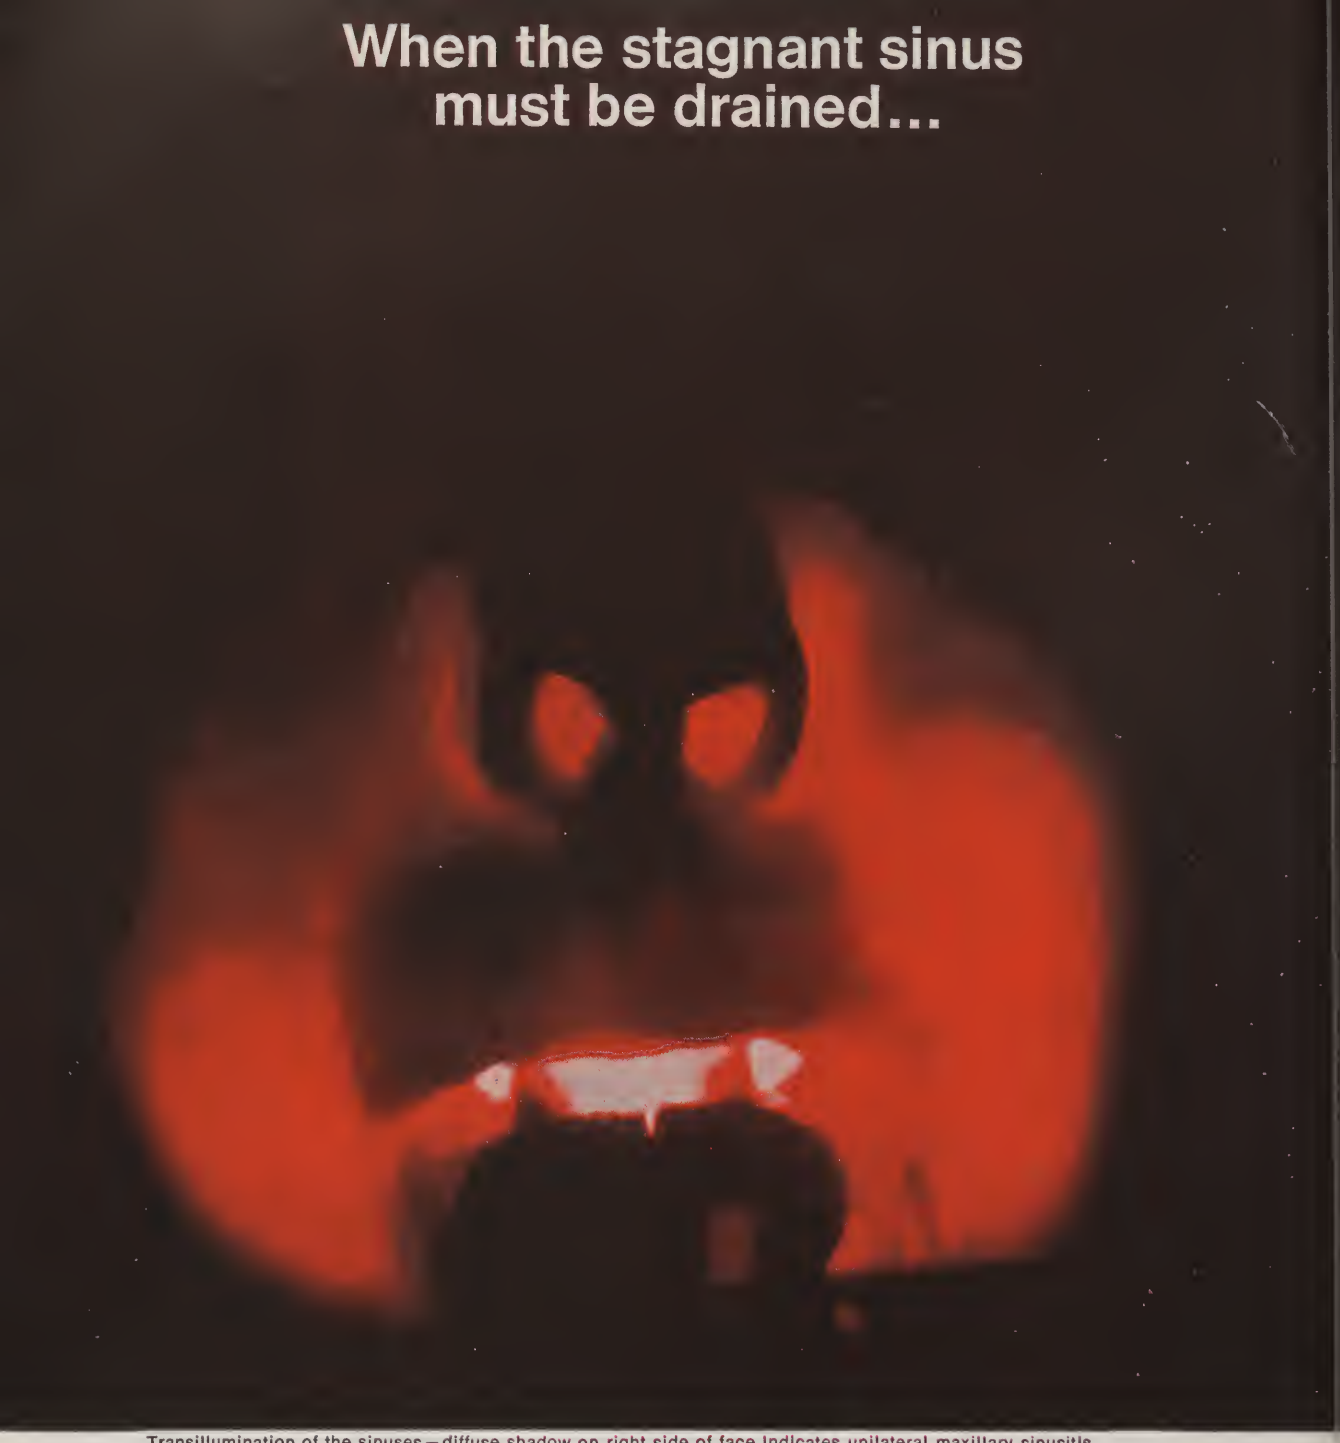
The BSP unit is designed for maximum patient protection. The precalibrated syringe makes weight calculations unnecessary and provides for proper dosage regardless of patient-weight.

ECONOMICALLY PACKAGED . . .

Prepared for economic unit dispensing, this completely disposable put-up affords a savings in time and labor—the most costly commodities.

BSP® DISPOSABLE UNIT

HW&D BRAND OF SODIUM SULFOBROMOPHTHALEIN INJECTION, USP



(50 mg. per ml.)

(BSP02)

When the stagnant sinus must be drained...

Transillumination of the sinuses—diffuse shadow on right side of face indicates unilateral maxillary sinusitis.

In the common cold, Neo-Synephrine is unsurpassed for reducing nasal turgescence. It stops the stuffy feeling at once. It opens sinus ostia to re-establish drainage and lessen the chance of sinusitis. With Neo-Synephrine, in the concentrations most commonly used, decongestion lasts long enough for extended breathing comfort, without endangering delicate respiratory tissue. Systemic side effects are virtually unknown. There is little rebound tendency.

Neo-Synephrine® HCl

Brand of phenylephrine hydrochloride

is available in a variety of forms, for all ages:

- 1/8% solution for infants
- 1/4% solution for children and adults
- 1/4% pediatric nasal spray for children
- 1/2% solution for adults
- 1/2% nasal spray for adults
- 1/2% jelly for children and adults
- 1% solution for adults (resistant cases)

Also NTZ® Solution or Spray
Antihistamine-decongestant

Winthrop Laboratories, New York, N.Y. 10016 Winthrop

Treat yourself and your investments to professional management...

WITH AN INVESTMENT MANAGEMENT ACCOUNT AT THE TRUST DEPARTMENT OF MARYLAND NATIONAL BANK

You will be relieved of all the cumbersome details of investment management and what's more important, you can stop worrying about what to buy and sell and when to do so.

Your securities will be under the careful supervision of our Investment Department with an Investment Officer assigned to your account. This Department, backed by our Investment Research and Administrative Departments, works under the direct supervision of our Trust Committee which is composed of senior officers and directors of our Bank.

Our annual fee for an Investment Management Account is based on the income and value of your account and is surprisingly low. As it relates to taxable income, the fee is tax deductible for Federal Income Tax purposes.

Why not discuss the advantages an Investment Management Account would have for you? There is no cost or obligation.

AMA '66
LAS VEGAS

Convention site "extraordinaire" that's Las Vegas. America's entertainment capital becomes the classroom for America's practicing physicians—offering you a comprehensive, compact, postgraduate course in recent developments in medical science. A magnificent Convention Center, fine hotels and motels, excellent restaurants plus star studded entertainment await you and your family.

The AMA's first clinical convention in Las Vegas offers a top notch scientific postgraduate program.

Scientific sessions will be held on the following topics: Scintillation Scanning • Radiation and Cancer • Clinical Pulmonary Physiology • Gastroenterology • Futuristic Diagnostic and Therapeutic Tools • Neck Pain • Antibiotics • Urology • Aerospace Medicine • Unconsciousness • Dermatology • Juvenile Diabetes • Endocrine and Metabolic Diseases • Pediatrics • Surgery • Hematology • Psychiatry • Otolaryngology.

Three Postgraduate Courses will be presented: Obstetrics and Gynecology • Fluid and Electrolyte Balance • Cardiovascular Disease. Each Course will consist of three half-day sessions, and there will be a registration fee of $10.00 for each course, payable with your advance registration.

Four Breakfast Round Table Conferences will be held on the following topics: The Management of Metabolic Bone Disease • Indication for Cardioversion • The Problems and Potential of L.S.D. • An Agonizing Reappraisal of Cancer Chemotherapy • **Closed Circuit Television • Medical Motion Picture Programs • Over 275 Scientific and Industrial Exhibits.**

The complete scientific program, plus forms for advance registration and hotel accommodations, will be featured in JAMA October 24.

Doctors take note...

Westminster at 6 E. Main St.

How long will it take her to recover from her hip fracture if she just doesn't care?

Does she really care? Is she alert, encouraged, positive and optimistic about getting completely well soon?

Or has she given in to the demoralizing impact of confinement, disability and dependency?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that can often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

Merrell

THE WM. S. MERRELL COMPANY
Division of Richardson-Merrell Inc.
Cincinnati, Ohio 45215

Frankly, most antihypertensives are pretty good if you give an adequate dose. I'm looking for one with a simple regimen so that mix-ups in doses and therefore the chance of side effects are minimized.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down

Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Geigy

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, AUGUST 4

1. Drs. William J. Peeples, State Health Commissioner, Edward Davens and Claude R. Dodson discussed means of facilitating communication between the Health Department and the Faculty.

2. State Health Department regulations for Nursing Homes, both Extended Care and Long Term Care, were approved.

3. At the request of the State Superintendent of Schools and the State Health Commissioner, the President was authorized to appoint a Faculty representative to the Joint Advisory Committee on School Health.

4. At the suggestion of the Treasurer, the Committee approved recommendation to the Council of an appropriation of up to $5,000 for the purchase of an accounting machine and related printed forms to increase the efficiency of bookkeeping and the accuracy of membership records.

EXECUTIVE COMMITTEE, SEPTEMBER 8

1. The following were approved for recommendation to the Commissioner of Motor Vehicles for appointment to the department's Medical Advisory Board: J. Sheldon Eastland, MD, James R. Karns, MD, and Paul F. Richardson, MD, Baltimore City, and Francis Carl Mayle, Jr., MD, Bethesda.

2. Miriam Van Gelder, MD, head of the Inpatient Program of the State Health Department's Division of Medical Services, conferred with the Committee on the Utilization Review of Extended Care Facilities throughout the State which is anticipated when the program becomes operative under Medicare Law.

3. In consideration of the State Health Commissioner's response to a July query addressed to the State Board of Health and Mental Hygiene, it was agreed that the Health Department has a standing invitation to attend any Executive Committee meeting to present material it considers important to the Faculty and that, reciprocally, the Committee would like to feel free to extend such invitations to Health Department representatives as it deems appropriate.

4. The Committee was advised that, according to the August 16, 1966, *Wall Street Journal,* Johns Hopkins Hospital plans to establish the position of Assistant Physician (formerly Senior Resident) and to bill government agencies for services rendered by such physicians. It was agreed that comments should be sought and an invitation to the next Committee meeting extended to informed staff members to discuss this.

5. A letter from Church Home and Hospital informed the Committee that its bylaws provide for staff appointments regardless of race.

6. The selection of a date for the next joint meeting of the Executive Committees of the Hospital Council and the Faculty was postponed pending receipt of a recommendation from the Faculty representative on the Areawide Health Facilities Council.

7. The Committee approved sponsorship of a meeting of Principal Nursing Home Physicians on the care rendered in nursing homes, and appointment of an ad hoc committee to develop a program for the meeting.

8. The resignation of Walter E. James, MD, as a Faculty representative on the Advisory Committee on Foster Care was accepted with regret and the President was authorized

to name a replacement.

9. Approval of the provision of staff assistance and space, without charge, for the Governor's Committee on Tuberculosis Control was granted, with the understanding that its study program would be completed within the next three months.

10. The President was authorized to appoint a Faculty representative to the Maryland Medical/Legal Foundation to replace Albert E. Goldstein, MD.

COUNCIL, SEPTEMBER 8

1. Present for the recommendation of the Fee Schedule Committee on budgetary figures for home and office visits under medical care programs (Title XIX of PL 89-97), and for the general discussion of this subject which followed, were representatives of the Advisory Council on Medical Care, the State Department of Health, the State Board of Health and Mental Hygiene, Maryland Medical Service and the Faculty's PL 89-97 Liaison Subcommittee. Subject matter encompassed the philosophies of the federal government in relation to payment for medical care, payment of fees to physicians so that receivers of service will benefit from the same standards as all recipients of medical care, and the need for education of legislators.

2. The Council unanimously adopted the following motion: "The Council requests the State Board of Health and Mental Hygiene to submit figures in the budget based on payment of the usual, customary and reasonable fees to physicians for services rendered under the medical care programs for the state; and that the figures provided by the PL 89-97 Liaison Subcommittee at its May 27, 1966, meeting be used as a working mechanism for preparation of budgetary figures only."

3. Physicians' defense was ratified for seven members, but denied to another because the incident occurred prior to application for membership in the Faculty.

4. Financial statements, covering both operating and restricted funds, were approved as presented.

5. The Council, on recommendation of the Executive Committee, authorized the expenditure of up to $5,000 for the purchase of an accounting machine and related printed forms.

6. Legal Counsel was reappointed for an additional year.

7. On recommendation of the Executive Committee, C. Thomas Flotte, MD, Baltimore City, was appointed Editor of the Journal, effective October 1, 1966.

8. The Council approved endorsement of the *CICHA Health Fair to be held in 1967, subject to established rules for Faculty participation in such a project and to no financial obligation on the part of the Faculty.

9. At the suggestion of the Baltimore City Medical Society, the Council voted to recommend to the House of Delegates Emeritus Membership in the Faculty for Victor Goldberg, MD, Baltimore City.

*Combined Industry and Commerce Health Appeal.

Diagnosis:

cystitis?
pyelonephritis?
pyelitis?
urethritis?
prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.d.
(initial adult dose)

cations: Urinary tract infections caused by gram-negative and some gram-itive organisms.

e effects: Mainly mild, transient gastrointestinal disturbances; in asional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild inophilia, reversible subjective visual disturbances (overbrightness of ts, change in visual color perception, difficulty in focusing, decrease in ıal acuity and double vision), and reversible photosensitivity reactions. ked overdosage, coupled with certain predisposing factors, has produced f convulsions in a few patients.

cautions: As with all new drugs, blood and liver function tests are advis- during prolonged treatment. **Pending further experience, like most motherapeutic agents, this drug should not be given in the first trimester regnancy. It must be used cautiously in patients with liver disease or ere impairment of kidney function.** Because photosensitivity reactions have urred in a small number of cases, patients should be cautioned to avoid ecessary exposure to direct sunlight while receiving NegGram, and if a ction occurs, therapy should be discontinued. The dosage recommended adults and children should not arbitrarily be doubled unless under the ful supervision of a physician. Bacterial resistance may develop.

n testing the urine for glucose in patients receiving NegGram, Clinistix® gent Strips or Tes-Tape® should be used since other reagents give a e-positive reaction.

age: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times y) for one to two weeks. Thereafter, if prolonged treatment is indicated, dosage may be reduced to two Gm. daily. Children may be given roximately *25 mg. per pound* of body weight per day, administered in ded doses. The dosage recommended above for adults and children uld not arbitrarily be doubled unless under the careful supervision of a sician. Until further experience is gained, infants under 1 month uld not be treated with the drug.

supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conve- ntly available in bottles of 56 (sufficient for one full week of therapy) and in les of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

erences: (1) Based on 23 clinical papers, 1512 cases. Bibliography on uest. (2) Bush, I. M., Orkin, L. A., and Winter, J. W., in Sylvester, J. C.: microbial Agents and Chemotherapy—1964, Ann Arbor, American iety for Microbiology, 1965, p. 722.

nthrop Laboratories, New York, N. Y. 10016

NegGram®

Brand of

nalidixic acid

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.

- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

EXECUTIVE SECRETARY'S NEWSLETTER

October, 1966

NIH PATIENT REQUEST

The National Institutes of Health has made known its need for patients as follows:

Hodgkin's Disease: patients with no previous treatment or minimal prior treatment. All clinical stages of biopsy-proven disease are acceptable. Major purpose of the study is to determine the curative potential of intensive radiotherapy in localized cases and to evaluate combination chemotherapy and x-irradiation in patients with generalized involvement.

Chronic Lymphocytic Leukemia: Referrals of selected patients, particularly those with high circulating lymphocyte counts, are needed. This is part of a continuing study of this disease, including therapy in patients with this disorder.

For further details, contact the Faculty office.

ALCOHOLISM FAIR

The Baltimore Area Council on Alcoholism is scheduling a Fair to be held at the Church of the Redeemer, October 27 and 28, from 3:30 p.m. to 6:30 p.m. The Faculty's Subcommittee on Alcoholism has endorsed this project in public education and urges physician attendance wherever possible.

PHYSICIAN MANPOWER

Increases in medical school enrollment and graduation are depicted below:

	1940	1965
Enrollment	21,271	32,428
Graduates	5,097	7,409

Planned expansion in 1967 will result in 992 additional places for medical students. In addition, at least 25 new medical schools are in the process of planning or construction. The State of Maryland has under discussion an additional medical school, although this is not included in the above figure of 25.

NEWS NOTES

Membership - Frederick F. Converse, M.D.
Public Relations - Jonas R. Rappeport, M.D.

Irving Freedman, M.D., has assumed his duties as the first full-time Chief of Medicine at Lutheran Hospital, Baltimore. He was formerly in the same capacity at the VA Hospital, Fort Howard.

American Society of Anesthesiology has designated the following new members of that group from Maryland:

Junior Members: Drs. Ines Carmen Cilliani, Jai Sung Lee, Hector Cortes Mendez, Carlos Garcia Miller, all of Baltimore; Blair Mercer Barnett, Silver Spring; Jack Raymond Collins, Bethesda; and Edward Patrick Juras, Rockville.

Federal Associate Member: Robert Michael Oliverio, Jr., Annapolis.

Active Member: Edwin Joel Goldman, Baltimore

CONGRESS ON SOCIO-ECONOMICS OF HEALTH CARE

The American Medical Association has announced the first national congress on the Socio-Economic of Health Care in Chicago, on January 22 and 23 1967, at the Palmer House. Further details are available through the Faculty office.

AMA-ERF FUN(d) DAY

The Woman's Auxiliary will sponsor its annual AMA-ERF FUN(d) DAY, on Thursday, November 10, at the Faculty Building.

This annual event raises money for contribution to the American Medical Association Education and Research Foundation. Each local auxiliary participates by sponsoring a booth displaying wares for sale. Admission, which includes lunch, is $1.00. Hours - 11:00 a.m. to 3:00 p.m.

NEW LOCATION

The Murray Baumgartner Surgical Instrument Co is now located in their new building at 2501 Gwynns Falls Parkway.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W. B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

V-Cillin K now has a unique glossy coating that banishes bitter penicillin taste and makes it easier to swallow. Within six seconds (just long enough for the tablet to get past the taste buds), the coating dissolves and the penicillin is ready for immediate absorption into the bloodstream. The patient still gets all the special benefits of V-Cillin K, including consistent dependability . . . even in the presence of food.

Indications: V-Cillin K is an antibiotic useful in the treatment of streptococcus, pneumococcus, and gonococcus infections and infections caused by sensitive strains of staphylococci.

Contraindications and Precautions: Although sensitivity reactions are much less common after oral than after parenteral administration, V-Cillin K should not be administered to patients with a history of allergy to penicillin. As with any antibiotic, observation for overgrowth of nonsusceptible organisms during treatment is important.

Usual Dosage Range: 125 mg. (200,000 units) three times a day to 250 mg. every four hours.

Supplied: Tablets V-Cillin K, 125 or 250 mg., and V-Cillin K, Pediatric, 125 mg. per 5-cc. teaspoonful, in 40, 80, and 150-cc.-size packages.

V-Cillin K® **Six-Second Barrier to Bitterness**

Maryland State Medical Journal
Vol. 15, No. 10
October, 1966

THE *JOURNAL* CHANGES EDITORS

George H. Yeager, MD

C. Thomas Flotte, MD

"The advent of this publication represents the culmination of the hopes and efforts of the officer body of the Faculty."

These were the opening words of George H. Yeager, MD, in a FOREWORD to the January, 1952, issue of the *Maryland State Medical Journal* (Vol. 1, No. 1). The founder and first Editor of the *Journal,* Dr. Yeager had only begun his "efforts," however. He continued as Editor until October 1 of this year, when his resignation, accepted by the Council on June 9 with regret and with an expression of appreciation for his many years of service, became effective.

Dr. Yeager, who is also a past president and secretary of the Faculty, is professor of Clinical Surgery at the University of Maryland School of Medicine and director of Professional and Supporting Services at the University Hospital.

He is editor of *The American Surgeon,* chairman of the Planning Council for the State Board of Health and Mental Hygiene, secretary of the Southern Surgical Association, and a member of many other medical societies.

An alumnus of the University of West Virginia, Dr. Yeager was graduated from the University of Maryland School of Medicine in 1929 and completed the four-year Surgical Residency Program at the University Hospital in 1933. He became a diplomate of the American Board of Surgery in 1940 and in 1942 began three and one-half years of military service in the Pacific. During part of that period he was the commanding officer of the 42nd General Hospital. He was awarded the Legion of Merit in 1945 and is presently serving as a surgical consultant to the Surgeon General, U.S. Air Force, with the rank of Brigadier General.

Dr. Yeager is the author of more than 60 published papers. He is married to the former Dorothy Stone and they have three children.

Dr. Flotte Second Editor

C. Thomas Flotte, MD, co-chief of the Department of Surgery and Director of Education at the University of Maryland, succeeds George H. Yeager, MD, this month as Editor of the *Journal.* He is on the staffs of the University Hospital and Maryland General Hospital.

A diplomate of the American Board of Surgery, Dr. Flotte is also a consultant to the U.S. Public Health Service in Baltimore and to the National Institute of Health in Bethesda.

Graduated from Franklin and Marshall College in 1943, he received his MD from Jefferson Medical College in 1946. Following his internship at Jefferson Hospital, he served for two years with the U.S. Navy Medical Corps in the South Pacific. After one year of residency at Washington Hospital and an additional four years at the University of Michigan Hospital, from 1954 through 1959 he was first an instructor and then an assistant professor in surgery and in postgraduate medicine at the University of Michigan. During that period he was also on the staff of the University of Michigan Hospital and affiliated with the V.A. Hospital in Ann Arbor and the Northville and Ypsilanti State Hospitals.

Dr. Flotte is the author of numerous articles on a wide variety of subjects, notably vascular disease, a special field of interest. He is also a member of many medical societies, local, state and national.

He and his family moved to Baltimore in January, 1960. He is married to the former Harriet Shand and the father of three children.

DO YOU HAVE A

SCIENTIFIC EXHIBIT

YOU WOULD LIKE TO DISPLAY AT THE 1967 ANNUAL MEETING

of the

MEDICAL AND CHIRURGICAL FACULTY?

The Medical and Chirurgical Faculty, in cooperation with Mead Johnson Laboratories, will present an Aesculapius Award to the author of the most outstanding scientific exhibit shown at the 1967 Annual Meeting. The Committee on Program and Arrangements of the Medical Faculty will judge the exhibit. The winner will be presented with a certificate, suitably inscribed with the title of the exhibit and the author's name, and will receive a $200.00 cash prize donated by Mead Johnson Laboratories. Presentation will be made during the convention.

All scientific exhibits accepted for showing at the 1967 Annual Meeting will be eligible for judging. As space in the exhibit hall is limited, applications should be sent promptly. Physicians interested should contact the chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201.

ANNUAL MEETING

APRIL 19, 20, 21, 1967

Baltimore

"All Interns are Alike"

It stands to reason. They all go through the same training; they all have to pass the same tests; they all have to measure up to the same standards; they all are underpaid, too. Therefore, all interns are alike.

That's utter nonsense, of course. But it's no more nonsensical than what some people say about aspirin. Namely: since all aspirin is at least supposed to come up to certain required standards, then all aspirin tablets must be alike.

Bayer's standards are far more demanding. In fact, there are at least *nine specific differences* involving purity, potency and speed of tablet disintegration. These Bayer® standards result in significant product benefits including gentleness to the stomach, and product stability that enables Bayer tablets to *stay* strong and gentle until they are taken.

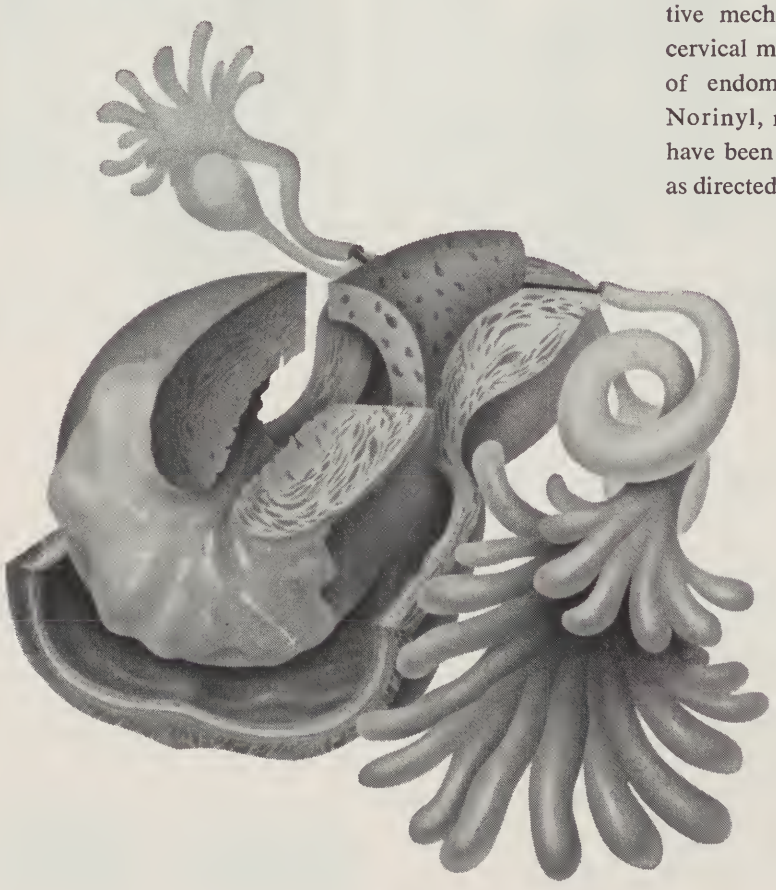
So next time you hear someone say that all aspirin tablets are alike, you can say, with confidence, that it just isn't so.

You might also say that all interns aren't alike, either.

BAYER ASPIRIN
FAST PAIN RELIEF

ORANGE FLAVORED
BAYER ASPIRIN CHILDREN

Norinyl® tablets



(norethindrone 2 mg. c mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.

plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

for multiple contraceptive action

ORAL DRUGS IN THE TREATMENT OF DIABETES MELLITUS

DeWITT E. DeLAWTER, MD
Clinical Associate Professor of Medicine
Georgetown University School of Medicine

The oral agents available for the treatment of diabetes mellitus are divided into two groups, the sulfonylurea group and the biguanide group. Of the sulfonylurea group, the three agents available are tolbutamide (Orinase), acetohexamide (Dymelor), and chlorpropamide (Diabinese). Tolazimide (Tolinase) will probably be available shortly. In the biguanide group the only agent available commercially is phenformin hydrochloride (DBI).

The first part of this discussion will be limited to the sulfonylurea group. The indications for the use of these drugs are:

1. Onset of diabetes after 30 years of age,
2. Absence of ketonuria,
3. Absence of severe symptoms, and
4. Approximately normal weight.

The contraindications for the sulfonylureas are:

Absolute:

1. Ketoacidosis

Relative:

1. Juvenile patients,
2. Classical diabetic symptoms,
3. Pregnancy,
4. Surgery or other stress, and
5. Hepatic and/or renal disease.

The relative group is so classified because there are instances in which the patient may respond satisfactorily in this category.

The mechanism of action of the sulfonylurea drugs may be considered grossly to be increased production of and increased release of insulin from the beta cells of the pancreas.

The sulfonylurea drug with which we have had approximately ten years' experience is tolbutamide. It is rapidly oxidized to an inactive metabolite; 75% of it is excreted within 24 hours and it has a blood half-life of approximately six hours. It is marketed in a tablet of 0.5 gm. The average dose is 1.5 gm/day, with a maximum dose of 3.0 gm/day. Administration is usually divided into two doses per day.

The second of the sulfonylurea drugs is acetohexamide. It is rapidly reduced to an inactive metabolite; 15% of it is excreted in 24 hours. It has a blood half-life of six plus hours. It is marketed in dosage forms of 0.25 gm and 0.5 gm. The average dose per day is 0.75 gm, with a maximum dose of 1.5 gm. This, too, is usually divided into two doses per day.

Chlorpropamide is not metabolized; 25% of it is excreted unchanged in 24 hours. It has a blood half-life of 30 to 36 hours. It is marketed in dosage forms of 0.1 gm and 0.25 gm. The usual dose is about 0.25 gm, with a maximum dose of

Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 22, 1966.

From the Department of Medicine, Georgetown University School of Medicine, Washington, DC.

0.75 gm. It is given as a single dose each day. An occasional disulfiram (Antabuse) flush-type reaction may occur with the drug.

Tolazimide is 85% excreted in the urine and has a blood half-life of seven hours. It is provided in dosage forms of 0.1 gm and 0.25 gm. The average daily amount is 0.5 gm and is usually divided into two doses daily. The maximum amount recommended is 1.0 gm/day.

Failure to respond to the oral agents has been generally divided into two classes: primary failure and secondary failure. Primary failure indicates no degree of satisfactory control of blood sugar levels with trial periods of up to one month. Secondary failures are those patients having satisfactory control for at least one month followed by unsatisfactory control in spite of maximum acceptable dose of drug used. Satisfactory control is indicated by little or no glucosuria and ability to maintain a blood sugar level below 190 mg/100 ml.

If properly selected patients are included in a series, the usual rate of primary failure is about 20%. The rate of secondary failure will be related to the degree of selectivity used for the series and the duration of the therapy. In one group of 200 patients treated with tolbutamide, the following cumulative rate of secondary failure was observed.[1, 2]

One year	16%
Two years	27%
Five years	36%
Ten years	40%

After five years there were still 26 (13%) patients out of the initial group of 200 taking tolbutamide. After ten years there were 13 (7.5%) taking the drug.

A comparison of primary and secondary failure rates for three agents—tolbutamide, chlorpropamide, and phenformin—after two years of trial, is shown in Table 1. It does not show acetohexamide because there has not been enough experience with this drug to be statistically significant. Both tolbutamide and chlorpropamide have a primary failure rate of approximately 20%; however, the secondary failure rate after two years of observation is 27% for tolbutamide and 12% for chlorpropamide. Note that emphasis is placed on two years of therapy because: the shorter the period studied, the less the degree of secondary failure, and the longer the period studied, the greater the degree of secondary failure. In the phenformin group there is a great amount of primary failure (31%) because of the high incidence of side effects with the use of this agent.

Table 1

A Comparison of Primary and Secondary Failure Rates of the Three Hypoglycemic Agents

Drug	Primary Failure %	Secondary Failure %
Tolbutamide	21	27
Chlorpropamide	18	12
Phenformin	31	12

The relative initial response to the incidence of secondary failure is shown in Fig 1. It is noted that the patients who demonstrate the best initial response are less apt to develop secondary failure. Those who show marginal or borderline control are more apt eventually to develop secondary

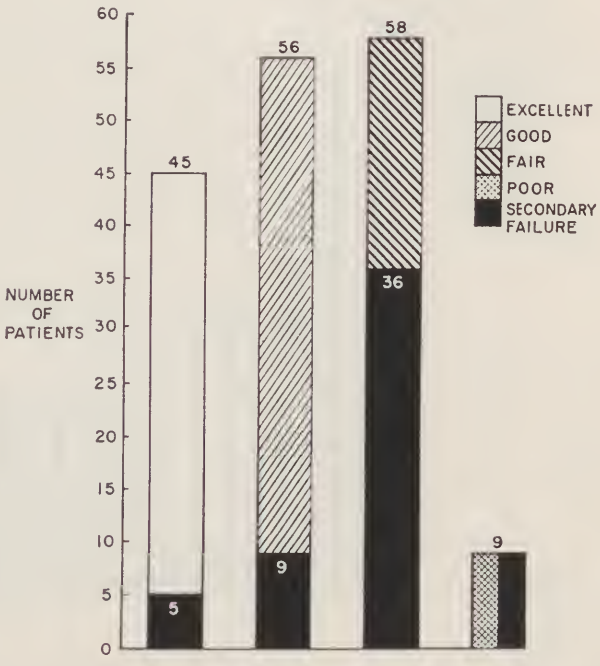

Fig 1

Effect of initial response of patients who developed secondary failure of response to tolbutamide.

failure. By excellent results is meant a blood sugar level of 120 mg/100 ml (Folin-Wu) or less; good results are approximately 150 mg/100 ml or less, and fair results 170 mg/100 ml or less. Failure is considered to occur when a patient cannot maintain the blood sugar level beneath 190-200 mg/100 ml.

A study was made on a group of 35 patients of the insulin requirements before and after tolbutamide trials (Fig 2). Twelve patients required more insulin before than after the trials; 15 required less before than after the trials with the oral agents, and 8 required the same amount. Therefore, it was concluded that the secondary failure was not due to a worsening of the diabetes since it did not demonstrate an increased requirement for insulin after the trial with sulfonylurea therapy.

The results of a group of 25 patients who developed secondary failure to tolbutamide is illustrated in Fig 3. They were then placed back on insulin for approximately six months and tried again on tolbutamide. The solid bars indicate the duration of the first trial, and the hatched bars demonstrated the duration of the second trial. It is noted that one patient obtained a successful second response for as long as eight months but eventually failed. It is concluded from this that patients who are secondary failures to the sulfonylurea agents may again be tried on the same sulfonylurea agent after a rest period on insulin therapy, but in each instance they will fail again with a lesser duration of successful therapy than the first time. This may also explain why an occasional patient will respond briefly to a less potent sulfonylurea agent after secondary failure

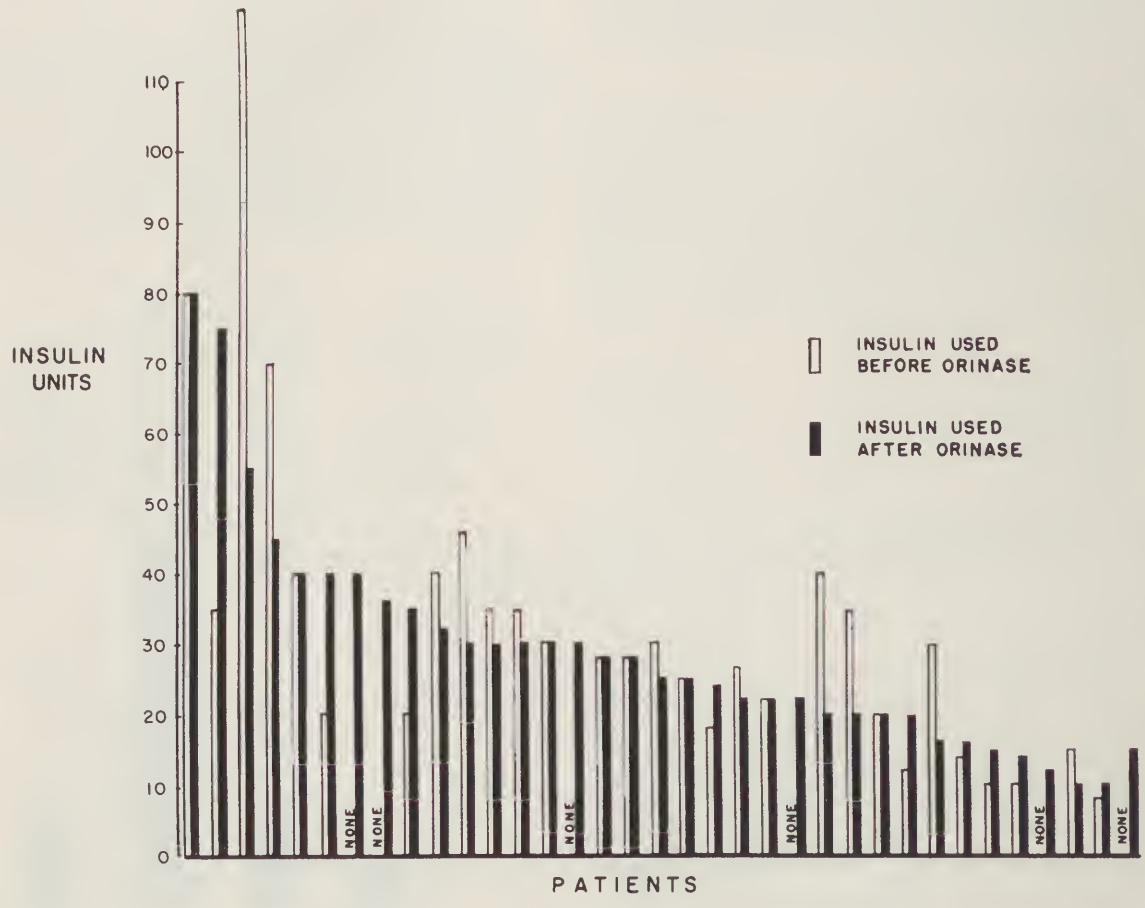

Fig 2

Insulin requirements of 35 patients before tolbutamide treatment and after secondary failure of response.

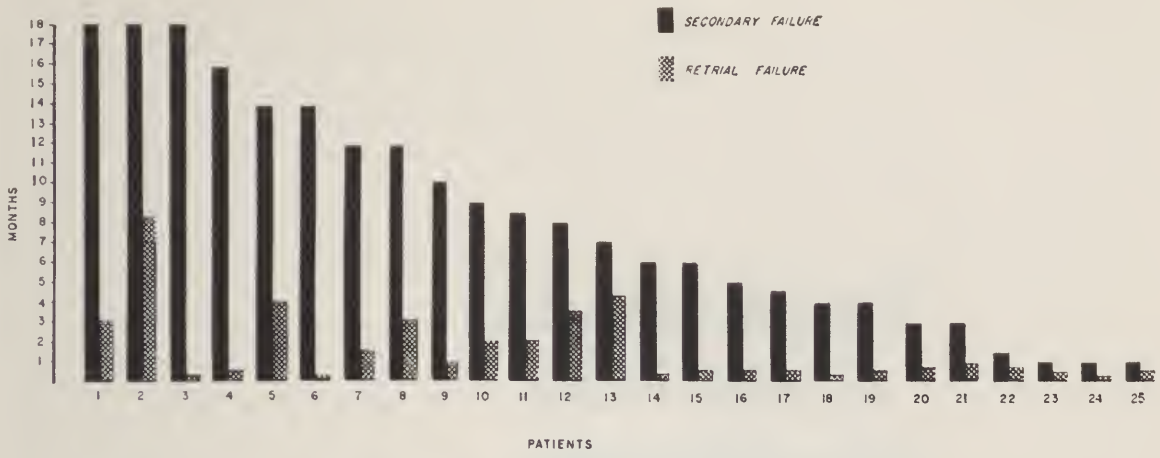

Fig 3

Duration of satisfactory responses in patients given retrial on tolbutamide subsequent to a rest period after secondary failure.

to a stronger one.

A placebo method of therapy was given to 27 patients with secondary failure to tolbutamide and the 27 patients failed. Twenty-five patients were retried on tolbutamide and all failed. Thirty-four secondary failures to tolbutamide were tried on chlorpropamide; 20 failed and 14 were successful. We attributed the effectiveness of the drug to its increased half-life and lesser rate of excretion of chlorpropamide. Twenty-three secondary failures to tolbutamide were tried on phenformin. Of these, 9 were failures and 14 responded. Phenformin has a different mode of action. The failure to respond to one of the sulfonylureas should be neither an indication for nor against the person's effectiveness with phenformin.

The effect of placebo and tolbutamide on six obese diabetic patients is shown in Fig 4. On the left side is the blood sugar scale of six patients treated with four weeks of diet alone with the maximum-minimum blood sugar levels, followed by four weeks of placebo and diet, and then four weeks of diet plus tobutamide. On the right side are shown the weights of the same patients on the four weeks of diet alone, followed by four weeks of placebo plus diet, and four weeks of tolbutamide plus diet. Weight control, as illustrated by the bars on the left side, demonstrated the placebo to be more effective than tolbutamide and emphasizes what has been known for a long time, that weight control is very helpful in control of the blood sugar level of the obese patient. It is really more

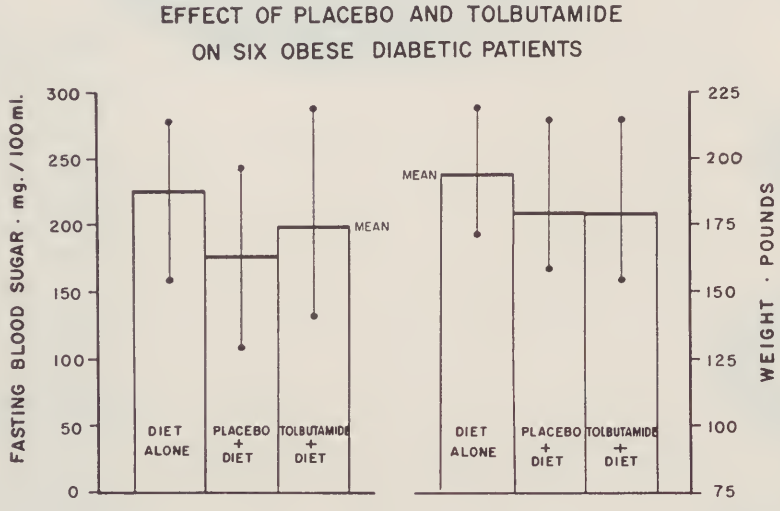

Fig 4

Comparative effect of a placebo and tolbutamide on blood sugar levels and weight of six obese patients.

When uncontrolled diarrhea brings a call for help

When the diarrhea sufferer has run the gamut of home remedies without success, pleasant-tasting CREMOMYCIN can answer the call for help. It can be counted on to consolidate fluid stools, soothe intestinal inflammation, inhibit enteric pathogens, and detoxify putrefactive materials — usually within a few hours.

CREMOMYCIN combines the bacteriostatic agents, succinylsulfathiazole and neomycin, with the adsorbent and protective demulcents, kaolin and pectin, for comprehensive control of diarrhea.

INDICATIONS: Diarrhea.

CONTRAINDICATIONS: Do not use in intestinal obstruction, extensive ulceration of bowel, or diverticulosis; in hypersensitivity to sulfonamides or neomycin; in pregnancy at term, in premature infants, or during first week of life in the newborn.

WARNINGS: Use only after critical appraisal in patients with hepatic or renal damage, urinary obstruction, or blood dyscrasias. Fatal hypersensitivity reactions and blood dyscrasias reported with use of sulfonamides. Consider periodic blood counts, hepatic and renal function tests during intermittent or chronic use.

PRECAUTIONS: Succinylsulfathiazole: Use with caution if there is history of significant allergies and/or asthma. Continued use requires supplementary vitamins B_1 and K. *Neomycin:* Watch for

your ℞ for Cremomycin can provide relief

curare-like neuromuscular block during anesthesia if neomycin is used preoperatively in large doses when renal function is poor; watch for overgrowth of nonsusceptible organisms. Consider possibility of ototoxicity and nephrotoxicity with prolonged high dosage.

SIDE EFFECTS: As with all sulfonamides: Headache, malaise, anorexia, G.I. symptoms, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, rash, conjunctival and scleral injection, petechiae, purpura, hematuria, and crystalluria have been noted. Reduced fecal output of thiamine and decreased synthesis of vitamin K have been reported. *Neomycin:* Nausea, loose stools.

Before prescribing or administering, read package circular with product or available on request.

promptly relieves diarrheal distress

Cremomycin®

ANTIDIARRHEAL

Composition: Each 30 cc. contains neomycin sulfate 300 mg. (equivalent to 210 mg. of neomycin base), succinylsulfathiazole 3.0 Gm., colloidal kaolin 3.0 Gm., pectin 0.27 Gm.

MERCK SHARP & DOHME Division of Merck & Co., Inc., West Point, Pa.

where today's theory is tomorrow's therapy

important than any of the oral agents.

Patients who are not successful with sulfonylurea therapy, or have developed secondary failure and are not successful on phenformin therapy to maximum dosage, often will show improvement on combination therapy of chlorpropamide plus phenformin. We have had 31 of 46 patients tried on such a combination who were successful. The dose is usually 0.5 gm chlorpropamide and 0.1 gm phenformin hydrochloride—in a timed-disintegration capsule (TD). Very occasionally, insulin plus phenformin is used to assist in the stabilization of a brittle diabetic.

If the patient requires insulin, he should have an adequate dose of insulin and no sulfonylurea therapy.

Table 2 has been compiled to show the comparative daily costs of hypoglycemic agents. It is self-explanatory. Of course, 70% of diabetics are overweight and could possibly be controlled on diet alone. Of the sulfonylurea drugs, the cheapest average daily dose is chlorpropamide. If combination therapy is used, it becomes quite expensive.

Table 2

Daily Costs of Hypoglycemic Agents

Drug	Amount	Cost
Insulin	40 Units	$ .15
Tolbutamide	1.5 gm	.27
Acetohexamide	1.0 gm	.18
Chlorpropamide	0.25 gm	.14
Phenformin TD	0.1 gm	.24
Combination		
Chlorpropamide	0.5 gm	.28
Phenformin TD	0.15 gm	.36

Cost is of considerable importance to these patients because of the long period of time in which they take the drug.

The other oral agent group not previously discussed is the biguanide group of which phenformin hydrochloride is the example. Indications for use of this drug are overweight adult diabetics, nonketotic adults who do not respond to sulfonylurea drugs, and in combination with the sulfonylureas when there is a poor response form each drug used alone.

Phenformin increases the glucose uptake in the muscles. Its metabolic rate is unknown. The duration of activity of tablets is perhaps three to six hours and the TD capsules, 8 to 16 hours. Dosage form is tablets of 0.025 gm and TD capsule of 0.05 gm. Minimum dose is 0.025 gm; average dose is about 0.125 gm to 0.15 gm, and maximum dose is 0.3 gm or to tolerance. It is usually divided into two or more doses daily. The results in 177 patients treated with phenformin are: satisfactory 56%, unsatisfactory 42%, other 2%. As the dose is increased, the side effects become relative to this increase.

The criteria for control to be strived for in the treatment of diabetes are:

1. Relief of symptoms of diabetes.
2. Avoidance of hypoglycemia.
3. Maintenance of normal weight.
4. Absence of glucosuria.
5. Blood sugar levels between 80-130 mg/100 ml before each meal.

If excellent control can be achieved with a sulfonylurea drug, with phenformin, or with a combination of the two, this is the treatment of choice. If it cannnot be achieved with an oral agent, the physician should not hesitate to advise the use of insulin and discontinue inadequate control with oral agents.

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

in chewable tablets

in granules for oral suspension

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets
In Granules for Oral Suspension

ERYTHROCIN®-SULFAS
Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

ABBOTT

The discomforts of

DIARRHEA
MUCOUS COLITIS
DIVERTICULITIS
SPASTIC URETERITIS
BLADDER SPASM

are relieved by direct musculotropic action with.....

Trocinate®

BRAND THIPHENAMIL HCl

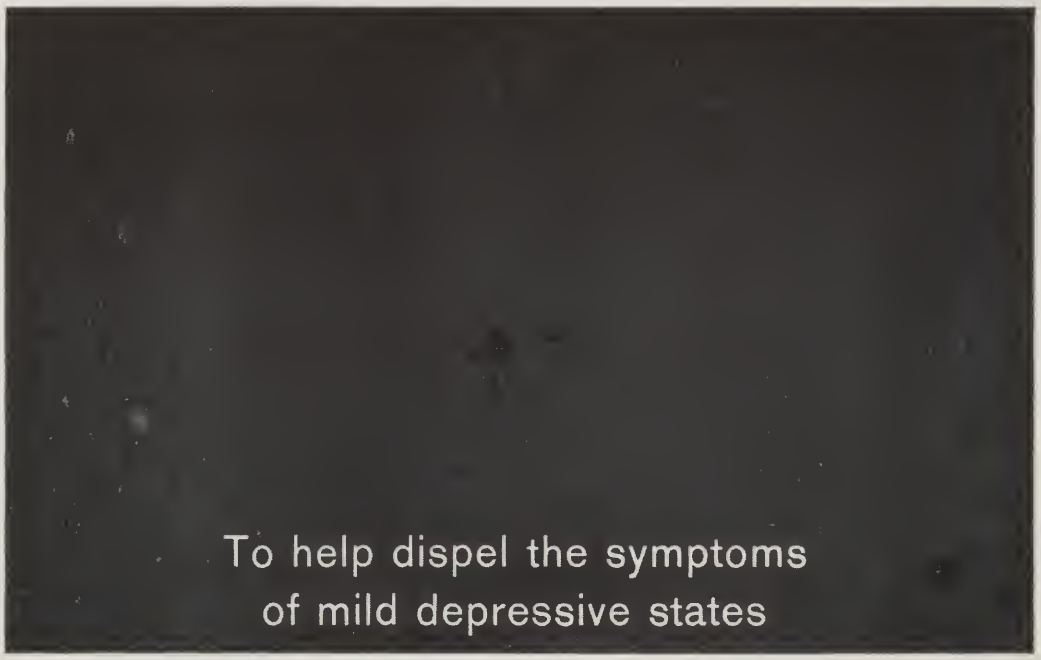
Available in 100 milligram pink sugar-coated tablets.

The high therapeutic index permits dosage sufficient to relieve spasm promptly.

Administer 4 tablets every 4 hours until relief is constant, then adjust maintenance dosage.

Trocinate *BRAND* THIPHENAMIL HCl

Directly relaxes smooth muscle spasm
Combats hypermotility
Non-mydriatic, may be used in glaucoma



Sixteen years of clinical use, with absence of untoward effects, has established the safety and effectiveness of Trocinate.

Trocinate is metabolized in the body and completely eliminated, which is a safety factor. Dosage must be sufficient to maintain the therapeutic blood level.

CONSIDER **DEXAMYL**® FIRST

brand of dextroamphetamine sulfate and amobarbital

Often within the hour, 'Dexamyl' works to help dispel such symptoms as apathy, pessimism, loss of interest and initiative, and lack of ability to concentrate.

Formulas: Each 'Dexamyl' Spansule® capsule (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming].

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*.

Precautions: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Do not use in patients taking MAO inhibitors. Excessive use of the amphetamines by unstable individuals may result in a psychological dependence; in these instances, withdraw the medication. Use cautiously in pregnant patients, especially in the first trimester. *Side effects:* Insomnia, excitability and increased motor activity are infrequent and ordinarily mild.

SK&F SMITH KLINE & FRENCH LABORATORIES

DIABETES-OBESITY: A NEW CONCEPT AND ITS MANAGEMENT

S. K. FINEBERG, MD, FACP
Clinical Associate in Medicine, New York Medical College; Visiting Physician, Harlem Hospital, New York City

Linking the two conditions obesity and diabetes with the term "obesity-diabetes" in the past has been done infrequently and casually. Possibly it has been used more often by myself than by others. About five or six years ago I attempted to emphasize the importance of the association by the initiation of a special clinic, the Obesity-Diabetes Clinic, for problems of this nature. Recently a rapid accumulation of evidence has given this hyphenation a new twist and a deeply significant meaning. It now seems probable that the obesity which is present in possibly as many as 85% of the older, maturity-onset diabetics is not "the most important precipitating and aggravating factor" of their disease. On the contrary, the obesity which precedes diabetes may be caused basically by the same inherited genetic defect which produces the clinically detectable impairment of carbohydrate metabolism. This new concept indicates that the obesity is actually an earlier stage of diabetes which may be present for many years prior to the development of carbohydrate tolerance. To put it simply; *The patient did not become diabetic because he was obese. He became obese because he was diabetic!* What appeared to be the principal cause (obesity) producing the effect (diabetes) is now being viewed as a manifestation of the developing clinical disease. For this reason (and I hope this does not add to the confusion of terms with which the explosion of knowledge in the field of diabetes has burdened us), I think it would be more appropriate to call this entity diabetes-obesity, at least in its premellitic if not in its postmellitic phase. It might be descriptive of the situation to speak now of "fat-diabetes" in which the clinical state is more one of abnormal fat metabolism in distinction from the later stage in which carbohydrate metabolism appears to be most disturbed.

The hypothesis that obesity can be a prediabetic or premellitic phase of diabetes is supported, among other evidence, by the repeated demonstration of increased levels of circulating insulin and insulin-like activity in obese subjects who subsequently develop diabetes and of normal to elevated levels of insulin and insulin-like activity in most obese diabetics. These findings have been adequately confirmed. Recently, Berson and Yalow have even suggested a classification of diabetes based on "high output" and "low output" of insulin. In this useful concept the nonketotic, maturity-onset diabetic and *obesity per se* are classified by them as high-output forms of diabetes. *Indeed, it now seems highly unlikely that any overweight diabetic could be suffering from insulin deficiency*, or as it is called, "insulinoprivic" diabetes.

Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 22, 1966.

Behind continued high blood pressure readings lies the possibility of organic damage[1-13]

MANY OF THE aspects of essential hypertension are unpredictable—either because there are a number of mechanisms involved or because individuals differ in their responses to these mechanisms.[1]

There is one aspect of hypertension, however, that seems, in many cases, predictable. ". . . when the blood pressure is elevated to a marked degree for an adequate period of time, this in itself leads to perpetuation of the syndrome with resulting vascular damage throughout the body."[14] All too often the disease progresses until there is damage to one of three vital organs: the heart, the kidney, the brain.

"Hypertension is certainly a major factor in the genesis of coronary heart disease, and it is even more important when compounded with obesity."[4]

"[Vascular deterioration] can be clearly seen in the kidney with a degree of damage that can be measured by renal function studies."[10]

". . . most evidence suggests that reduction of blood pressure, when it is too high, not only relieves the heart of excess work but reduces vascular damage."[1]

"In short, treatment is indicated."[1]

Antihypertensive therapy will not restore the blood vessels to normal. Yet many of the vascular changes and symptoms caused by increased blood pressure may be arrested or alleviated when the blood pressure is reduced to normotensive levels.[7]

Reducing the blood pressure helps curtail further vascular damage and improves the prognosis — when damage is not too far advanced before therapy is started.[14] Essential hypertension is an indication not only for treatment, but for *early* and adequate treatment of the patient in question.

Reduce the blood pressure with Rautrax-N

Rautrax-N combines the antihypertensive-tranquilizing action of whole root rauwolfia with the antihypertensive-diuretic action of bendroflumethiazide in one convenient medication. The two drugs complement each other so that smaller doses of both are possible.

Rauwolfia combined with bendroflumethiazide is particularly effective in long-term therapy,[15-17] since beneficial effects do not diminish with continuous daily administration.

For most patients 1 or 2 Rautrax-N tablets daily are sufficient for maintenance therapy. The simplicity, convenience and economy of such a dosage schedule are of particular benefit to older patients.

Contraindications: Severe renal impairment or previous hypersensitivity. **Warning:** Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting or G.I. bleeding occur.

Precautions and Side Effects: The dose of ganglionic blocking agents, veratrum or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Caution is indicated in patients with depression, suicidal tendencies, peptic ulcer; electrolyte disturbances are possible in cirrhotic or digitalized patients. Marked hypotension during surgery is possible; consider discontinuing two weeks prior to elective surgery and observe patients closely during emergency surgery. Rauwolfia preparations may cause reversible extrapyramidal symptoms and emotional depression, diarrhea, weight gain, edema, drowsiness may occur. Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients, and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, rashes may occur.

Dosage and Supply: Initial dosage, 1 to 4 tablets daily, preferably at mealtime. Maintenance, 1 or 2 tablets daily. Rautrax-N is supplied as capsule-shaped tablets containing 50 mg. Rauwolfia serpentina whole root (Raudixin®), 4 mg. bendroflumethiazide (Naturetin®), 400 mg. potassium chloride.

Also available: Rautrax-N Modified — capsule-shaped tablets containing 50 mg. Rauwolfia serpentina whole root (Raudixin), 2 mg. bendroflumethiazide (Naturetin), 400 mg. potassium chloride. Both potencies available in bottles of 100. For full information, see Product Brief.

RAUTRAX®-N

Squibb Rauwolfia Serpentina Whole Root (50 mg.) with Bendroflumethiazide (4 mg.) and Potassium Chloride (400 mg.)

Pathogenesis

Currently the most appealing theory of the pathogenesis of most diabetes is that it is due to an enzymatic defect in the biosynthesis of insulin with the compensatory overproduction of an abnormal, biochemically less active form. Although this may be abnormal insulin in that its effect on the transport of glucose into the cell is impaired, it is either normal or more active than normal in regard to fat synthesis and deposition. In the months or years preceding the loss of pancreatic ability to compensate for defective insulin formation, an insulin-effected lipogenesis produces obesity. Proportionately little diabetes is due to an actual deficiency or relative deficiency of insulin. The greater portion is due to a lack of effective insulin action stemming from one or possibly several different causes.

Establishing the cause as genetic may tend to eradicate the stigma of gluttony and diminish the feeling of guilt which many obese diabetics have about their obesity. It may also be reassuring to physicians to know that this form of obesity is not psychogenic in origin and, consequently, may respond more readily to therapy. The altered relationship of obesity from a cause to a concomitant manifestation of diabetes does not and should not change the fundamental therapeutic approach to this form of disease. The observation that weight reduction improves impaired carbohydrate metabolism and that the restoration of normal weight often makes diabetes no longer detectable by currently available diagnostic methods is as valid today as when it was first made more than 25 years ago. Latent, subclinical, even frank, diabetes can be, and often has been, reversed by this means alone to the premellitic or prediabetic phase. It is the only treatment of diabetes which can produce a remission with any degree of consistency. The mechanism through which this is accomplished may be through the restoration of a state of compensation or of sensitivity to impaired endogenous insulin action.

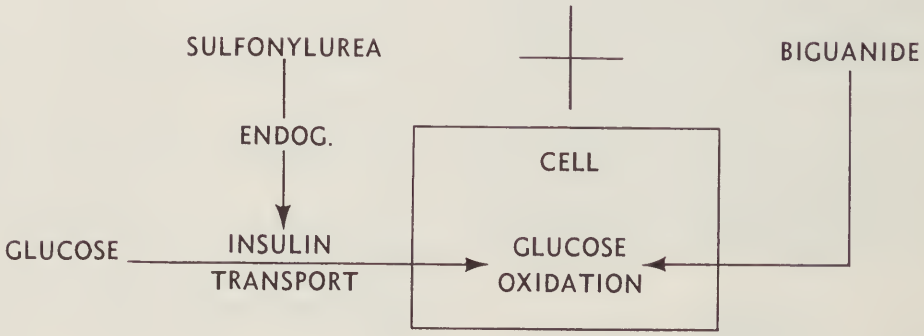
Management

The treatment of choice of diabetes-obesity, then, is weight reduction. The clinical axiom that the primary therapeutic target in this disease is the obesity remains unchanged and unchallenged. Insulin or oral hypoglycemic drugs should not be used until every effort has been made to control the diabetes by this means alone over a period of at least several weeks. Immediate control is not urgent since most of these ketosis-resistant diabetics have had considerable hyperglycemia and glycosuria for many months. It is more important for the newly discovered diabetic to see his glycosuria decrease, then disappear entirely, as he loses 10 to 15 pounds. The proper treatment of his condition will then be firmly fixed in his mind forever.

A simple diet of mixed nutrients chosen from the four basic food groups and calorically restricted through the use of small portions, estimated by household measurements, is recommended. This diet should be carefully reviewed with the patient as he is started on a "course" of education in good nutrition and caloric dietetics. This may loom as a difficult task to many physicians because although formal medical education is well-founded in the biochemistry of nutrition, it is usually lacking in its practical application. The patient must learn from his physician what the essential food groups are and the approximate caloric value of everything he eats. Successful education of the patient also requires his acceptance that this new way of life has to be permanent. Obesity, whatever the cause, is a disease which can only be controlled, it cannot yet be cured. Without mental adjustment to these facts, the lifetime control of diabetes-obesity, as well as obesity per se, is not possible.

During the early stages of education and mental adjustment, a specific mode of appetite control may be helpful. Anorexigenic medication, skillfully used, produces chemical control of the appetite center and symptomatic relief of hunger. The standard and leader in the field of anorexigenic agents is phenmetrazine hydrochloride (Preludin), with dextroamphetamine almost as potent and as well-tolerated. These drugs seem to be particularly useful in diabetes-obesity because of its nonpsychogenic origin. A careful explanation of their sole purpose as symptomatic relief is imperative to avoid diverting the patient from his diet education to excessive reliance on medication.

Recently, it has been especially noted that in more than 60% of women a negative caloric intake below that needed for maintenance will produce a reduction in scale-weight for the first few weeks or months only. Although the fat content of these women is actually decreasing, the



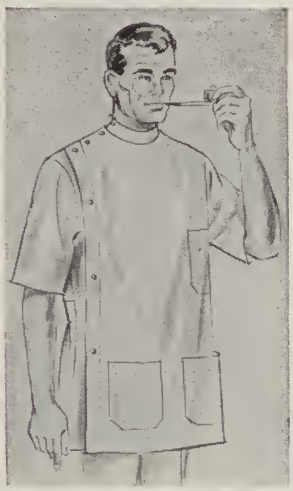
development of water retention counterbalances the fat loss and effectively masks it. This metabolic abnormality, whose cause is still unknown, is less transient and far more common than previously believed. Its detection and correction with diuretics is often essential to long-term successful weight reduction.

Oral Hypoglycemics

The proper indication for turning to a therapeutic trial of oral hypoglycemic drugs is *diabetes which is uncontrollable, not simply uncontrolled, by diet alone.* However, if weight loss is not being effected in the obese diabetic and glycosuria is excessive, the biguanide, phenformin hydrochloride (DBI), may be tried alone at first. The use of any oral hypoglycemic drug in this situation is not a therapy of choice but of concession or defeat. The enhancement of intracellular oxidation of glucose by phenformin in the *absence* of insulin-stimulated increased glucose transportation into the cell is usually not sufficient to control the diabetes. Consequently, the addition of sulfonylurea of often required. It is probably better to *add* a small dose than switch to sulfonylureas alone to minimize the lipogenic effect of their endogenous insulin release.

The combination of chlorpropamide (Diabinese) with phenformin affords the most potent oral hypoglycemic action available today. Combined therapy should probably be tried in all new diabetics of any age if they appear to be of the high-output type and are not in serious difficulty, before turning to insulin therapy. In the insulin-insensitive, often insulin-resistant, obese diabetic, the use of insulin is even less appropriate than oral hypoglycemic drugs. Injecting insulin adds an exogenous source of this lipogenic hormone to already increased levels of circulating endogenous insulin. What follows is first a discouraging, undesirable weight gain and then an increasing insulin requirement. The latter effect appears to be due to development of a significant amount of insulin-binding antibodies. Unfortunately, the obese diabetic seems to be particularly predisposed to the antigenicity of injected nonhuman insulin sources.

Many obese diabetic patients have been observed with fasting blood sugar levels of 300 to 400 mg/100 ml without acidosis while receiving 50 to 150 units of isophane insulin suspension (NPH insulin) daily! Instead of increasing their insulin, these individuals should be given a trial of combined chlorpropamide-phenformin therapy without any insulin at all. The combination frequently produces immediate and satisfactory control. As indicated, the sulfonylurea stimulates the output of less antigenic, endogenous insulin and the biguanide enhances glucose oxidation (Fig). The large amount of exogenous, more antigenic, lipogenic insulin needed in these cases to exceed the insulin-binding capacity of the serum and provide a small amount of free, unbound, active insulin may thus be entirely replaced by oral drugs.



Suggested synergistic action of combined oral hypoglycemic drugs in enhancing glucose metabolism.

The clinical application of these concepts is obvious and practical and has already been tried. All obese diabetics receiving insulin should be re-evaluated to decide whether attempting substitution of combined oral therapy for insulin is warranted. Under careful observation many of these patients can be safely converted from unnecessary, and to them, at least, possibly harmful, insulin therapy.

Definition and Summary

The recent explosive accumulation of new knowledge calls for the frequent redefinition of diabetes. At this moment a total concept of the disease in summary, which includes and indicates the status of diabetes-obesity may be stated as follows: *diabetes is a genetically determined and transmitted defect in carbohydrate metabolism, detectable by current diagnostic methods, often preceded or accompanied by microangiopathy, obesity, or other evidence of a premellitic phase and produced by a lack of effective insulin action.*

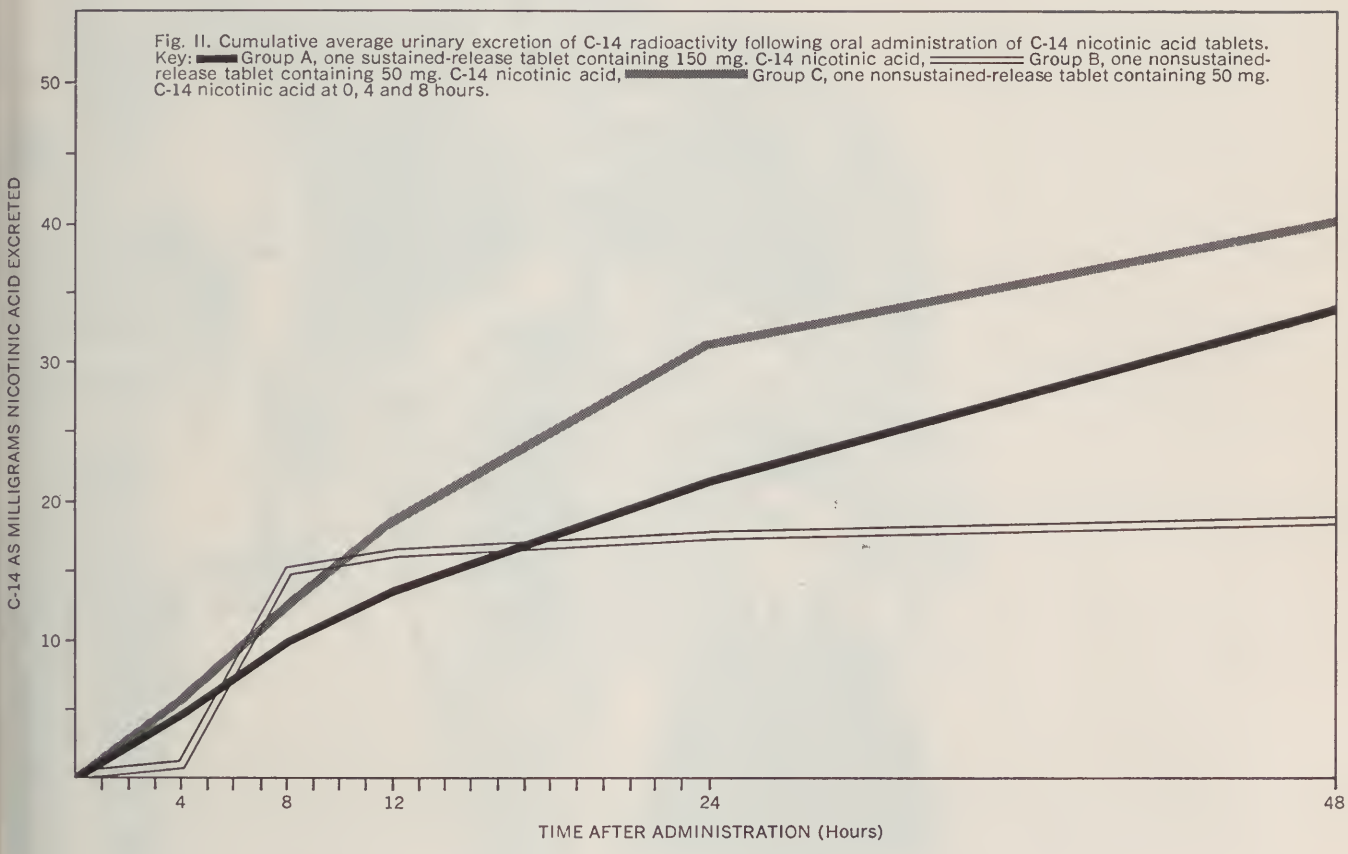
Sustained circulatory, respirator and cerebral stimulation for th

Fig. I. Average plasma levels of C-14 radioactivity following oral administration of C-14 nicotinic acid tablets. Key: ▬ Group A, one sustained-release tablet containing 150 mg. C-14 nicotinic acid, ═══ Group B, one nonsustained-release tablet containing 50 mg. nicotinic acid, ▬▬ Group C, one nonsustained-release tablet containing 50 mg. C-14 nicotinic acid at 0, 4 and 8 hours.

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

,ged and debilitated

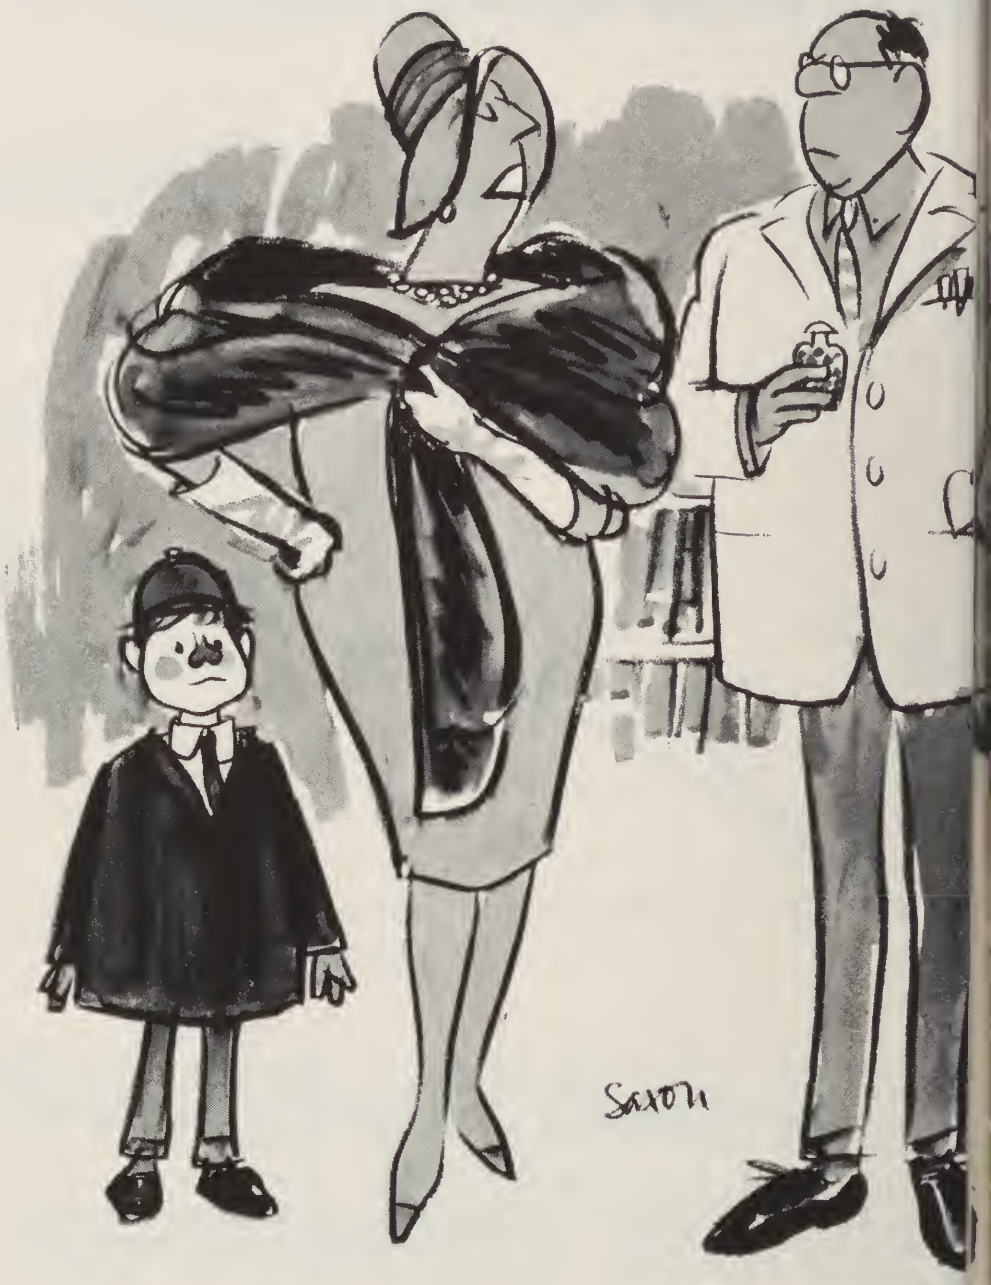
less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.



Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

Tempotrol® Time Controlled Tablet

Saxon

Look, Doctor, what he needs is a shot of penicillin.

Maybe. Maybe not. In any case, he needs something to control his cough.
If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.
When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.
Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.
Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

COMPLICATIONS IN THE USE OF ORAL HYPOGLYCEMIC AGENTS

MAX ELLENBERG, MD
Associate Attending Physician, Mount Sinai Hospital;
Associate Clinical Professor of Medicine,
Mount Sinai School of Medicine

The complications associated with the use of any therapeutic modality become extremely important factors, since certainly the treatment must not be more serious than the disease, and the newly contemplated therapy, if more advantageous, must be reasonably as safe as that which is already available. In diabetes we have a most wonderful drug, namely, insulin. Insulin has withstood the test of time and is uniformly therapeutically successful under all conditions. It is associated with virtually no toxic reactions. Therefore, we have a right to expect considerable safety in the use of oral agents, even though they offer the highly desirable feature of not requiring daily or, at times, even more than daily injections with a needle and syringe.

One can state categorically that the complications associated with oral therapeutic agents in clinical use today are remarkably minimal and mild. These drugs are essentially safe and are associated with few reactions of any consequence.

I think it pertinent to stress that they are not effective in all instances, and one must be alert to prevent the possible complication of ketoacidosis in these cases. Even when one can anticipate a high degree of success, there still are some primary failures, defined as those who do not respond to the drug before three to six months have elapsed, and secondary failures, which may be defined as those diabetic patients who no longer respond after a satisfactory initial response of six to twelve months' duration. The incidence of secondary failure is reportedly higher with tolbutamide (Orinase)[1] than with chlorpropamide (Diabinese). The treatment for this is to change to another of the oral agents to combine a sulfonylurea with phenformin hydrochloride (DBI), or both. If the response still is unsatisfactory, the patient is reverted to treatment with insulin.

Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 22, 1966.

From the Department of Medicine, Mount Sinai Hospital, New York, NY.

Hypoglycemia

The primary therapeutic effect of these drugs is to combat hyperglycemia. As a consequence, an abnormal hypoglycemia may be a problem. Any of these drugs may cause hypoglycemia which is usually short-lived and easily controlled. However, there is a small incidence of a serious reaction which does not appear to be dose related. This rare eventuality occurs almost exclusively in the elderly diabetic who has recently undergone a period of weight loss and is debilitated. In these instances, relatively minute doses, such as one or two tablets of the oral sulfonylureas, may produce profound and persistent hypoglycemia that may last for days and may require the continued use

of hypertonic glucose solutions to maintain life. Some of these patients either have died or have had permanent neuropsychiatric difficulties. This has been reported primarily with tolbutamide. The probable mechanism is inability to carboxylate tolbutamide.

Tolbutamide is largely excreted in the urine as the carboxylic acid metabolite produced by oxidation of the methyl ring. It is of interest, therefore, that there has been demonstrated an apparent inability to either form or excrete the carboxyl tolbutamide metabolite, ie, an apparent inability to metabolize and excrete tolbutamide, resulting in high therapeutic levels long after discontinuation of the drug. This suggests a metabolic (enzymatic) defect. In keeping with this theory, a patient has been observed with a prolonged tolbutamide-induced hypoglycemia, with a persistently high serum level after discontinuation of the medication. Another way of saying this is that the patient does not have the ability to inactivate the drug.[2, 3] A similar case with the use of acetohexamide (Dymelor) has recently been observed.

Soon after the sulfonylureas were introduced, they were advocated for many nondiabetic conditions, including acne, angina, parkinsonism, multiple sclerosis, thromboangiitis obliterans, and arteriosclerosis. The hypoglycemic effects of sulfonylureas in nondiabetics is much more marked than in the diabetic; severe hypoglycemic reactions may, and indeed did, develop even with small doses in nondiabetic patients, particularly the elderly or debilitated individuals, and are followed by serious, irreversible effects.

Fajans[4] reported that the intravenous administration of sodium tolbutamide to six patients with functioning islet cell adenoma produced profound decrease in blood sugar concentration for a prolonged period. There is a twofold importance to this: if one suspects the presence of an islet cell adenoma and is performing the intravenous tolbutamide test for diagnostic purposes, he should be thoroughly prepared to administer large amounts of glucose intravenously for prolonged periods of time. On the other hand, it must be appreciated that this can be an important and definitive diagnostic procedure.

In a discussion of hypoglycemia as a side effect and complication, it must be borne in mind that the combination of sulfonylurea drugs with phenformin is a potent hypoglycemic agent and may at times cause profound hypoglycemia.

Side Effects

Side effects of any of the drugs may be divided into hypersensitivity reactions and those which are dose related. In general, those which are dose related are readily controlled by either reducing the quantity or stopping the drug. Hypersensitivity reactions almost always occur during the first few weeks of therapy. I recall that when the oral hypoglycemic agents were first introduced, it was feared that if they had to be discontinued and the patient again put on insulin, this would be the basis for the occurrence of severe insulin allergy insofar as interrupted therapy is often the forerunner of insulin allergy. Fortunately, this eventuality has not come about, and I have never seen a case of insulin allergy when insulin has had to be reintroduced under these circumstances.

One of the more important hypersensitivity reactions is jaundice. Jaundice when it occurs with the oral agents is invariably the hypersensitive type, namely, cholestatic hepatitis. These cases, fortunately, have all been relatively mild and the patients have recovered when the drug was discontinued. Hepatitis was formerly much more common with chlorpropamide; however, since the recommended dose of chlorpropamide has been reduced to a maximum of 500 mg, there have been virtually no cases of clinical jaundice. The incidence of hepatitis today with any of the sulfonylureas is minimal in frequency and mild in nature.

Another hypersensitivity reaction is that following the ingestion of alcohol. In a few patients who are taking sulfonylurea drugs, the ingestion of alcohol results in redness and flushing of the skin (the color has been described as "cerise"). Other than the discomfort and embarrassment of the acute color change, this has no significance. Rarely, with chlorpropamide, the ingestion of alcohol may produce a severe disulfiram (Antabuse) reaction. Also among the hypersensitive reactions are the dermatologic complications, including erythema nodosum, maculopapular rashes, and, rarely, exfoliative dermatitis.

Although mild and usually transitory, changes may occur in liver function tests. A prolonged study by Haunz[5] of liver function in patients treated with chlorpropamide revealed that after

five years there was no significant elevation of SGOT, SGPT, or alkaline phosphatase levels. When changes in liver function do occur, they are those of an inconstant and usually temporary increase in serum alkaline phosphatase and sulfobromophthalein retention.

The nonallergic toxic reactions have been classified as hematologic or gastrointestinal in nature. Occasionally, interruption or even discontinuation of therapy is indicated. The most frequent side effects with the sulfonylureas in the gastrointestinal tract are anorexia, nausea, vomiting, epigastric discomfort, and, rarely, diarrhea; these are infrequent and usually mild.[6] Many of the gastrointestinal symptoms associated with these drugs have been eliminated by simply omitting coffee from the diet.

Agranulocytosis has been reported in three cases with chlorpropamide and one case with tolbutamide. Further investigation showed that in at least one case the platelet agglutination test result was positive, thus supporting the concept of there being an immunologic mechanism. One fatal case of aplastic anemia while the patient was receiving tolbutamide has been reported, but the relationship is highly questionable.

Other described side effects include chest pain and muscle weakness. One case of nephrosis has been reported during tolbutamide administration, but it has only a presumptive relationship. More recently, an association between these drugs and the induction of hypothyroidism has been suggested; this must await further confirmation.

Biguanides

Since the only biguanide marketed in this country is phenformin, I shall use the latter name. This drug may produce the side effects of nausea, vomiting, anorexia, a metallic taste, and unexplained weakness and lassitude. These symptoms may be severe and definitely limit the use of this drug. The symptoms are strictly dose related, and their incidence rises rapidly when more than 150 mg/day are administered to patients.

I rarely prescribe more than 100 mg/day in any patient.

Nevertheless, since the introduction of the prolonged action form of phenformin, the incidence of side reactions has been reduced. No cases of liver toxicity have ever been reported with this drug, nor have there been any evidences of renal or hematologic abnormalities in patients taking them.

The mechanism of action of phenformin is entirely different from that of the sulfonylureas. Thus, phenformin may be used in cases where there is no functioning pancreatic islet cell tissue. This is why it was originally introduced for the treatment of the juvenile diabetic; but even in those cases where it did control the hyperglycemia and glycosuria, a stunting of growth resulted, presumably secondary to anorexia and diminished caloric intake.

The mechanism of action of phenformin revolves around its ability to inhibit some of the oxidative systems, such as cytochrome oxidase and succinic dehydrogenase.[7] This produces a state of tissue anoxia accompanied by an increase in glucose uptake and a decrease in hepatic production of glucose. The inhibition of respiration causes an increase in both anaerobic glycolysis and lactic acid production. Therefore, pyruvate and lactate may, theoretically at least, accumulate in the blood.

It also raises the serious question as to what role phenformin plays in lactic acidosis. The association of phenformin with inhibition of oxidative systems and theoretic rise in blood lactic acid with lactic acidosis seems obvious. However, more careful study and contemplation reveal: (1) lactic acidosis does not occur only in the diabetic: (2) when it does occur in a diabetic, it need not be associated with the use of phenformin; and (3) when lactic acidosis does occur, it almost invariably has an underlying severe pathologic derangement associated with shock or a shock-like state, such as severe vascular insult to the body physiology.

In a case report of attempted suicide with phenformin, there was severe abdominal pain and severe cramps, nausea, and explosive vomiting, but the blood lactate and blood carbon dioxide levels remained normal, and there was no ketonemia. Incidentally, there also was no hypoglycemia.

A special committee appointed by the American Medical Association concluded that phenformin does not play a role in lactic acidosis coma when it occurs in diabetes. Nevertheless, when one has a diabetic patient taking phenformin and the patient develops any symptoms that could possibly be an

underlying cause of lactic acidosis, it would seem logical to discontinue the drug.

It is important to note that phenformin seldom if ever lowers the blood sugar into the range of significant hypoglycemia.

General Comments

All these drugs share one factor in common, namely, they are usually inadequate to control the diabetes under conditions of stress, including major surgery, trauma, vascular insults, and severe infection. Under such circumstances, they should be discontinued and insulin used until the acute distress has been controlled; they then may be reinstituted.

Certainly it seems clear that it should be first established whether dietary therapy is inadequate to control the diabetes before using any of these drugs. The role of gross dietary indiscretion in promoting therapeutic failure is considerable. Because drug treatment is so convenient, some patients become careless about their diet. In actuality, the diet requires as great attention as with insulin. Diet control is clearly allied to success with the oral agents.

Although we have been discussing the complications associated with the use of oral agents, a very serious question arises as to the effect of these drugs on diabetic complications per se, specifically the microangiopathy and neuropathy. When first introduced, it was hoped that these drugs would not only help control the carbohydrate metabolic abnormality, but also would have a salutary effect on the degenerative aspects of the disease. It may be categorically stated at this time that the drugs have had no beneficial effect whatosever on complications. Conversely, however, the drugs have had no deleterious or adverse effects on the basic complications. Occasionally one sees acute diabetic neuritis precipitated after control of the diabetes has been established with one of these drugs. It is important, therefore, to realize that the drug is not the offending agent. Rather, it is the sudden institution of control, and not the therapeutic agent, be it insulin, diet, or oral hypoglycemic agent.[8]

UP TO 10–12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

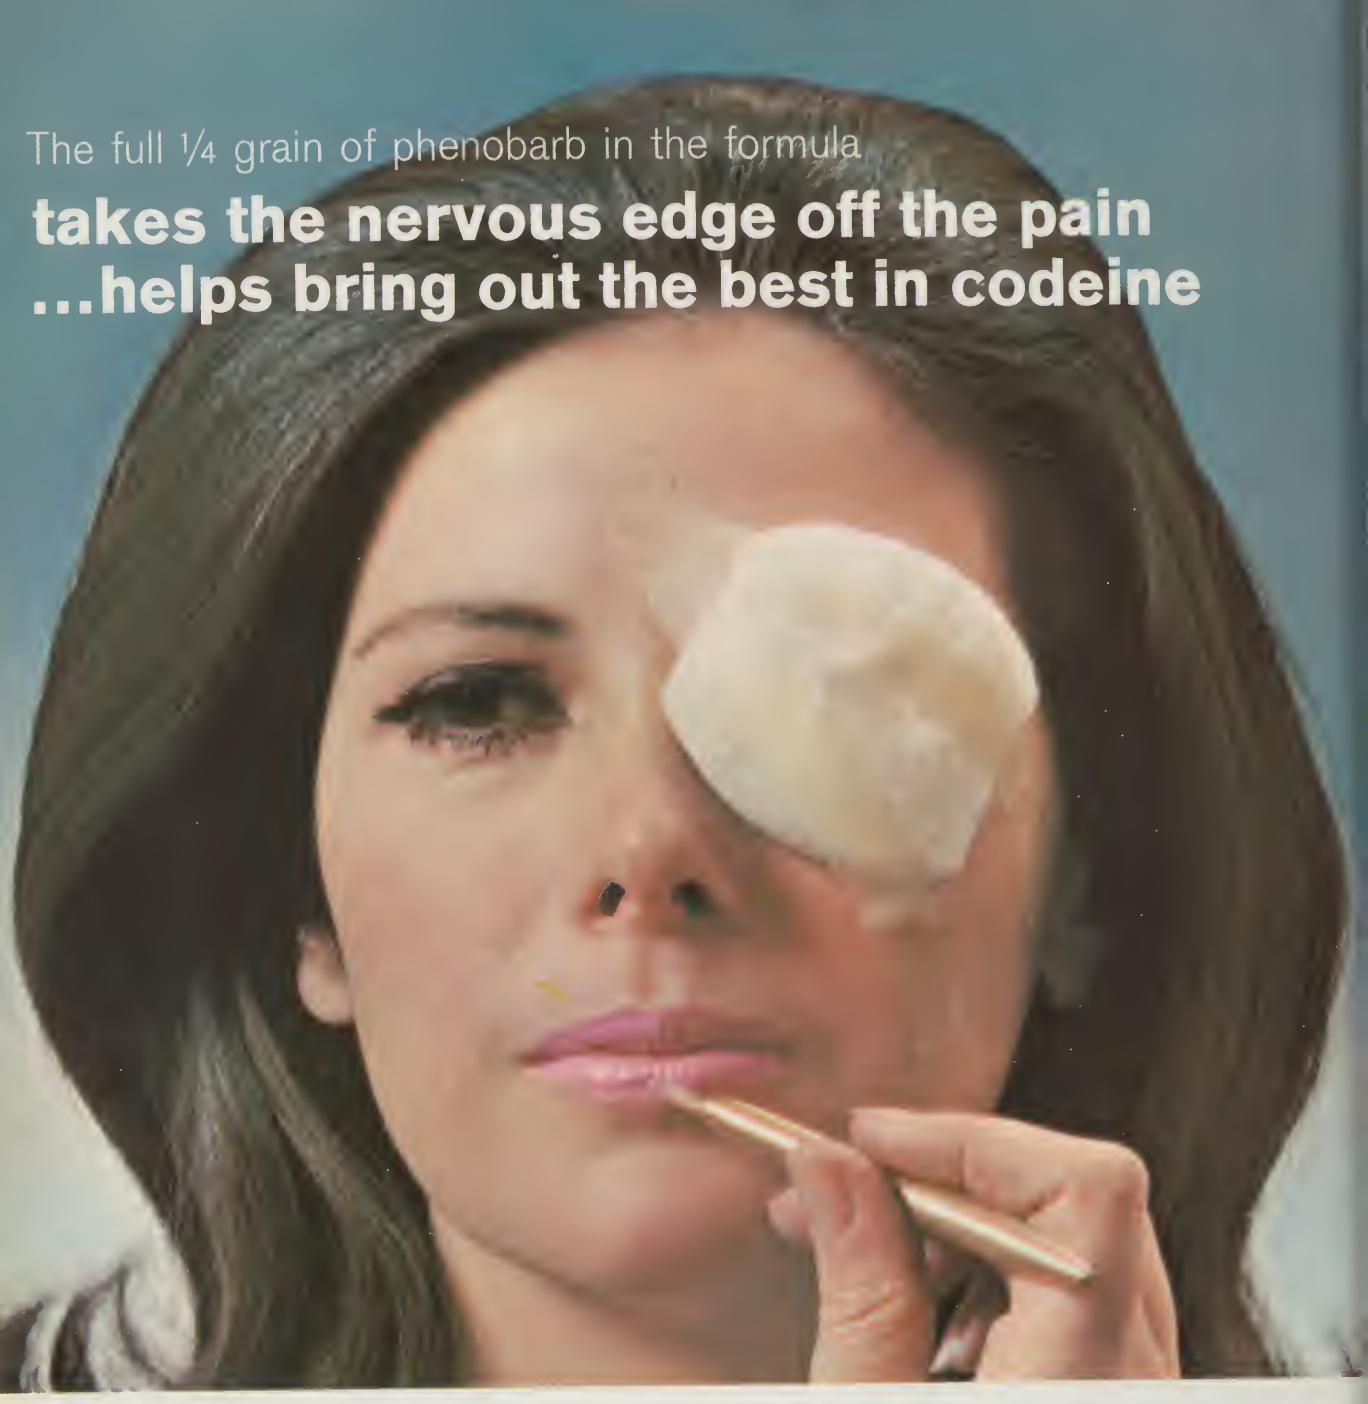
In sinusitis, colds, or U.R.I., Dimetapp lets congested patients breathe easy again. Each Extentab brings welcome relief all day or all night, usually without drowsiness or overstimulation. Its key to success? The Dimetapp formula—Dimetane (brompheniramine maleate), a potent antihistamine reported in one study to have elicited side effects as few as the placebo,* teamed with decongestants phenylephrine and phenylpropanolamine—in a dependable 10- to 12-hour form.

*Schiller, I. W., and Lowell, F. C.: New England J. Med. 261:478, 1959.

Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.



Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.

Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

A·H·ROBINS

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

Each capsule contains:

Phenobarbital (¼ gr.) ..... 16.2 mg.
(Warning: may be habit forming)
Aspirin (2½ gr.) .....162.0 mg.
Phenacetin (3 gr.) .....194.0 mg.
Hyoscyamine sulfate .....0.031 mg.
Codeine phosphate.....¼ gr. (No. 2), ½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

A-H-ROBINS

A. H. ROBINS CO., INC., Richmond, Va. 23220

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

CHARMS THE HYPERACTIVE COLON

CANTIL®

(mepenzolate bromide)

helps restore normal motility and tone

IN BRIEF:

One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide) —25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL —containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

ACUTE AND CHRONIC INFLAMMATION OF THE BRONCHIAL TREE

WILLIAM KEITH C. MORGAN, MD
Assistant Professor of Medicine
University of Maryland School of Medicine

To some extent every patient with pneumonia, no matter whether bacterial, rickettsial, viral, or chemical in origin, has some concomitant bronchitis and tracheitis. In general, the symptoms produced by the bronchitis are of minor severity and as the pneumonia responds to treatment, they subside. Rarely cough may be so irritative and distressing, as for example in primary atypical pneumonia, that symptomatic treatment is necessary. If this is so, then the best agents for suppressing cough are either codeine or dextromethorphan. In some instances relief can be obtained by providing adequate humidification of the patient's room. This can be done effectively with a simple type of humidifier such as is used in the treatment of infantile broncholitis and which is available for rent from many pharmacies. These forms of bronchitis are of importance only as manifestations of the original disease and further discussion of them is not indicated.

In any discussion of chronic inflammation of the bronchial tree, the two diseases that immediately spring to mind are chronic bronchitis and bronchiectasis. The latter is becoming relatively uncommon and, moreover, as its management is well-described in most textbooks, it is felt that it would be superfluous to give a long and detailed description of the disease in this paper. It seems more appropriate to say something about the less well-known but much more common condition of chronic bronchitis. This entity is being recognized with increasing frequency now; 20 years ago, however, a diagnosis of chronic bronchitis was meaningless to most physicians in the United States. Currently, the disease has acquired a certain notoriety as a cause of considerable mortality and morbidity in England and to a lesser extent in the United States and Western Europe. Increased interest in the condition and the more adequate dissemination of medical knowledge have led to its being described, if a trifle sparsely, in the recent editions of the standard textbooks of medicine used in the United States. Prior to this it had been known as "smoker's cough," a term which sounds so innocuous that it was not thought worthy of mention in learned texts.

Chronic bronchitis is defined as a disease characterized by the secretion of excess mucus by the bronchial tree. Pathologically there is an increase in the number of mucous glands and goblet cells present in the bronchial wall. This was first demonstrated by Dr. Lynne Reid[1] and is illustrated in the Figure*. In a normal person the mean depth of the mucous gland layer (A) is less than 25% of the distance from the epithelial surface of the bronchial mucosa to the cartilage (B). In a person with bronchitis the ratio A/B may be 50%

Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 21, 1966.

*Page 58

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

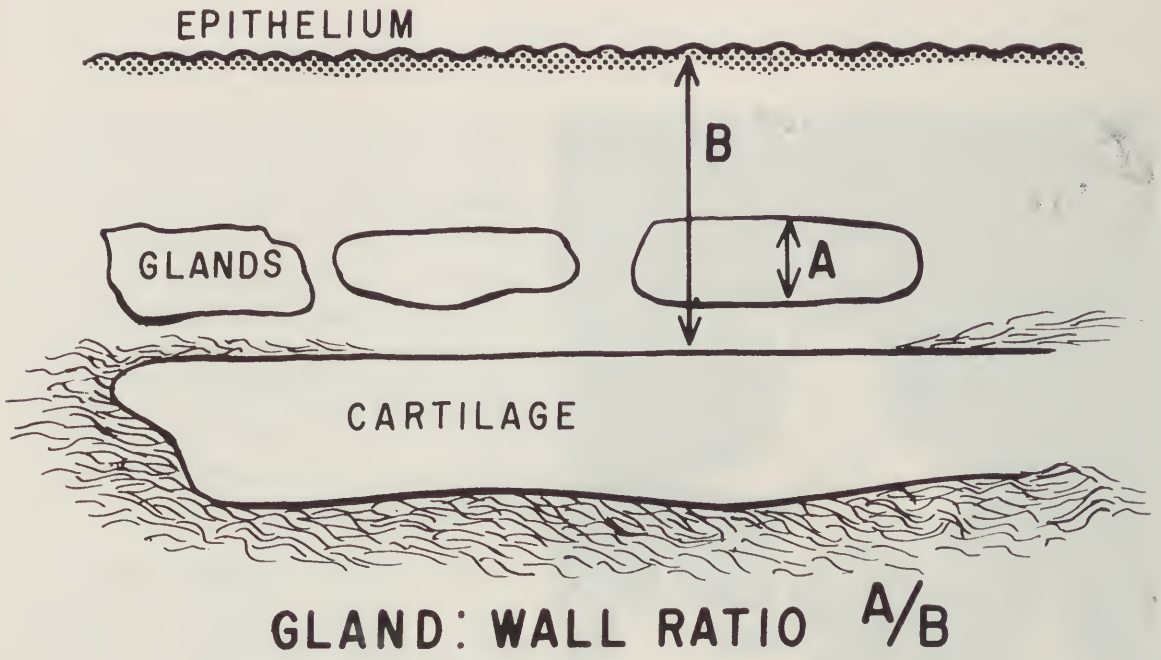
*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.



LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

or more. With the cessation of smoking, the mucous gland hypertrophy and bronchial wall changes revert in part towards normality.

Clinically, chronic bronchitis manifests itself by symptoms of cough and sputum which occur in the absence of localized destructive disease of the lungs such as bronchiectasis or tuberculosis. A normal person secretes about 100 ml of mucus per day. This is analogous to insensible perspiration in that one is not aware of it as it is continuously swept up by ciliary action and subconsciously swallowed. By the time chronic bronchitis has developed, the subject usually has a persistent cough. At first the cough is often relatively dry, but as time goes on, it produces increasing amounts of mucoid sputum. The disease characteristically affects male cigarette smokers living in urban communities. In the early stages, the symptoms of cough and sputum are accepted with equanimity as the price which the smoker must pay for his pleasure. Later his attitude changes and he finds the price exorbitant. After 5 to 10 years of his smoker's cough, the patient notices that every time he has a viral infection of his upper respiratory tract, it tends "to go to his chest." His sputum becomes mucopurulent or frankly purulent, and there is concomitant shortness of breath. He is now suffering from obstructive airway disease, and clinical signs of emphysema are occasionally found. From now on his course is that of slow but steady deterioration until he finally succumbs to cor pulmonale or respiratory failure.

Assuming the subject with chronic bronchitis seeks medical aid, what can be done to alleviate his symptoms? It seems that the excess mucus is secreted as a protective measure to counteract the chronic irritation produced by air pollution and cigarette smoking. The cessation of smoking is therefore imperative if it is hoped to arrest the progress of the disease. Secondly, one can attempt to relieve the associated obstruction of the smaller airways. In general this is irreversible and, consequently, attempts to do this are not too rewarding. A third approach concerns itself with the treatment of the infective element of the disease. Much of the morbidity and some of the mortality produced by chronic bronchitis seem to stem from the acute exacerbations that occur most frequently in the winter months. During the exacerbations, which usually last for five to ten days, the patient's cough becomes worse, his sputum changes from mucoid to mucopurulent or frankly purulent, he is often more short of breath, and he sometimes has minor constitutional symptoms, including anorexia and occasionally low-grade

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

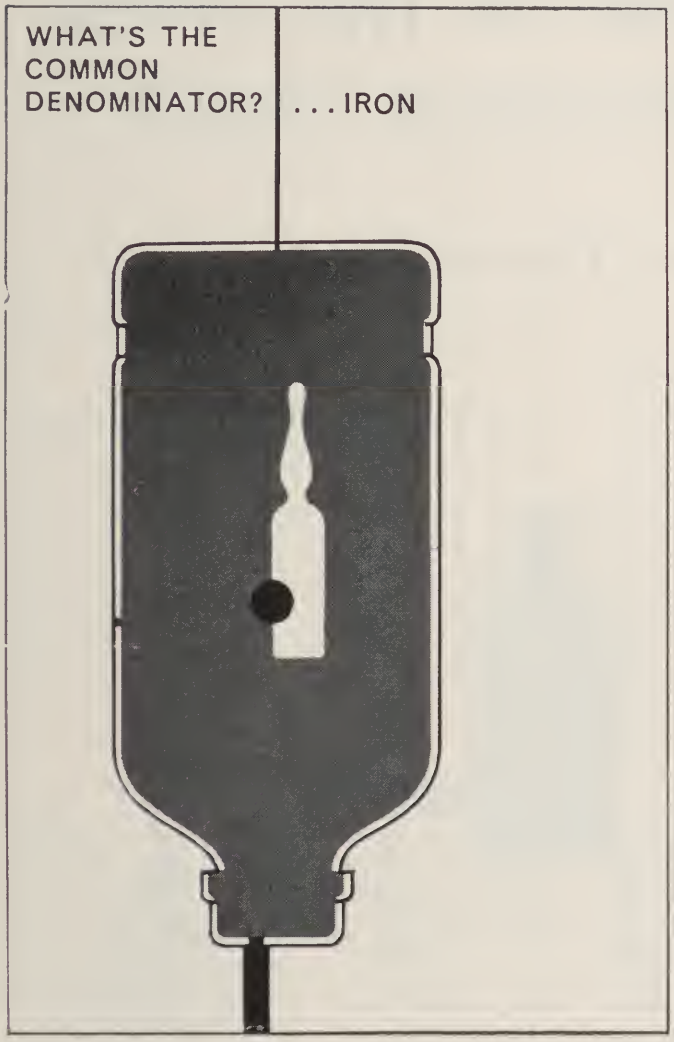
Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY



fever. The precipitating factors and exact cause of these exacerbations are still not fully understood, but recently considerable progress has been made towards this end. During remissions when the patient's sputum is mucoid, cultures yield a variety of organisms, including *Diplococcus pneumoniae, Haemophilus influenzae, Neisseria catarrhalis,* and various streptococci. Many of these bacteria seem to be present in the mouth and nasopharynx as commensals only. In contrast at the time of the exacerbations when the sputum is purulent, *D pneumoniae* and *H influenzae* are isolated much more frequently and it seems that the purulence of the sputum is directly related to the number of these two organisms present.[2] Furthermore, suitable antibiotic therapy reduces not only the purulence of the sputum but also the frequency of isolation of both *H influenzae* and *D pneumoniae.* It has also been possible to demonstrate an increased incidence of antibodies to *H influenzae* in subjects with chronic obstructive airway disease; however, no rise in antibody titer was found at the time of the exacerbations or immediately following them.[3] Thus, there is good circumstantial evidence that *D pneumoniae* and *H influenzae* play some role in either the development or prolongation of the exacerbations. Additional evidence in favor of this hypothesis can be found from bacteriological examination of the secretions of the lower respiratory tract. If during bronchoscopy the bronchial tree of a normal subject is washed out with a saline solution and the aspirate cultured, it will be found to be sterile. In contrast, if the same procedure is carried out in a patient with chronic bronchitis, the culture of the aspirate usually yields *H influenzae* and *D pneumoniae.* The presence of these organisms in the lower respiratory does not of necessity incriminate them as pathogens, but taken in conjunction with the other evidence already outlined, it is possible to build up a pretty good case against them. On the other hand, were bacterial infection the whole story, it should be possible to prevent the acute exacerbations by putting susceptible subjects on a suitable antibiotic throughout the winter months. This desired state cannot be realized for although, daily administration of tetracycline throughout the winter lessens the duration of the exacerbations and also seems to prevent or reduce the severity of some of them, complete protection cannot be achieved by this means.[4] Therefore, it seems that factors other than primary bacterial infection of this disease precipitate the acute exacerbations. Carilli and his co-workers studied the natural course of this disease and showed that an antecedent viral infection preceded the exacerbations in about 50% of their subjects.[5] Thus, it seems that viral infections may damage the bronchial mucosa and allow secondary bacterial infection to occur. It also seems probable that air pollution can act in a similar fashion. The evidence to date suggests that the prompt and effective treatment of these exacerbations is as effective as are long-term antibiotics. It is therefore recommended that any patient with chronic bronchitis who develops an upper respiratory tract infection with an associated increase in the purulence of his sputum should immediately be given a seven-to-ten-day course of an appropriate antibiotic. In this context, one of the tetracyclines (2 gm/day) or ampicillin (2 to 4 gm/day) is to be preferred. Without any doubt, the best means of avoiding the morbidity and mortality associated with the acute exacerbations is to prevent them. To a great extent this could be effected if there were an active polyvalent vaccine available for use against the majority of the common viral pathogens affecting the respiratory tract. No such vaccine exists to date, although attempts are being made to manufacture one. Until we can prevent the exacerbations, it behooves us to make every effort to treat them as effectively and as early as possible.

In fact, there's as much iron...250 mg. ...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses. Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

MANAGEMENT OF INFLAMMATION OF THE UPPER GASTROINTESTINAL TRACT

Part I. Acute and Chronic Pancreatitis

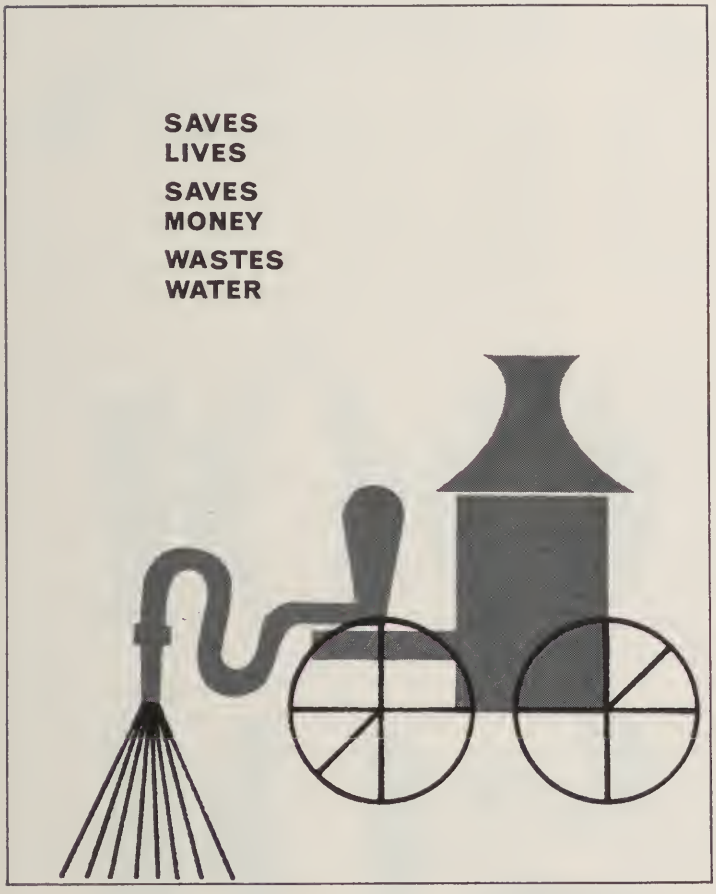
ROBERT A. FISCHER, MD
Clinical Instructor in Medicine
George Washington University School of Medicine

A discussion of the management of inflammatory disease of the upper gastrointestinal tract should properly include that portion of the alimentary canal between the mouth and the ileocecal valve, as well as the pancreas, liver, and biliary tract. I would like to limit myself to a discussion of the management of one of the most common inflammatory problems, pancreatitis, and one of the less common but most interesting "inflammations," regional enteritis.

We may divide pancreatic inflammatory disease into two broad classifications,—acute and chronic pancreatitis. We will later point out that a further subclassification is necessary in any discussion of chronic pancreatitis.

Acute pancreatitis may cover a spectrum of inflammation ranging from relatively mild pancreatic edema, (ie, seen with mumps parotitis) to severe, fulminating, largely fatal, necrotic pancreatitis. Since therapy of the former is relatively simple and the outcome uniformly good, I should like to discuss that form of pancreatitis which we label acute necrosis of the pancreas and which includes all instances of acute, necrotic, severe pancreatitis. In this form, hemorrhage may or may not be a prominent feature. Suppuration is relatively infrequent.

Though the purpose of this symposium is not to discuss the etiology and pathogenesis of acute pancreatitis, it should be remembered that the overwhelming majority of cases are associated with either alcoholism or biliary tract disease. It is important to distinguish between these two etiologies because the therapy and prognosis may differ.



Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 21, 1966.

MEDICAL THERAPY OF ACUTE PANCREATITIS

Not too many years ago, surgery was felt to be the treatment of choice in acute pancreatitis. This consisted mainly of cholecystectomy and lesser sac drainage. Mortality was, however in excess of 50%. At present, gastroenterologists and surgeons mostly agree that it is unwise to attack acute pancreatitis surgically except when suppuration or a developing mass has occurred. The other indication for emergency surgery is the necessity of ruling out a possibly perforated viscus. Conservative medical management is today the treatment of choice for acute pancreatitis, and may be divided into control of the following modalities.

A Shock, Dehydration, and Electrolyte balance. —The most urgent requirement is the prevention and/or treatment of shock. The patient with an

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

acute necrotic pancreatitis may lose large amounts of whole blood. Initially, plasma loss may be extremely severe with a subsequent later fall in red cell masses. We have found it expedient to use either plasma, albumin, or whole blood replacement. One must never underestimate the immense capacity for volume loss in acute pancreatitis. With the relatively simple methods today of measuring central venous pressure in the right atrium, vigorous fluid replacement therapy can be undertaken without fear of circulatory overloading. Low molecular weight dextran has been found useful in emergency situations where plasma or whole blood are not available.

Constant gastric suction must be employed to remove the stimulus for continuous pancreatic secretion. Because of this, electrolyte replacement must be given intravenously on the basis of daily requirements and loss through continuous suction. One must keep an adequate urinary output, maintaining at least 1000 cc of urine a day if possible. The onset of renal failure is a very poor prognostic sign and makes the management of electrolyte balance even more difficult.

Saponification of peripancreatic and mesenteric fat may cause removal of massive amounts of calcium from the circulation. This may become apparent, especially on the second or third day of illness. A concentration of less than 7.5 mg/100 ml is associated with a greater than 80% patient mortality. Calcium losses may necessitate the use of amounts of intravenous calcium. We have found that a 10% solution of calcium gluconate-glucoheptonate is satisfactory for replacement therapy. The presence of a persistently normal serum calcium level in the face of a severe acute necrotic or hemorrhagic pancreatitis should alert one to the possibility of a functioning parathyroid adenoma. Reports of hyperparathyrodism in association with acute pancreatitis have been increasing in recent years.

B. Control of Pain.—It is important to appreciate the necessity for relieving the pain of acute pancreatitis, since it may cause severe vasoconstriction, leading to decreased blood flow to the myocardium, and may so impair pancreatic blood flow as to convert pancreatic edema into necrosis. Meperidine (Demerol) in doses of 50 to 100 mg administered intramuscularly every 3-4 hours, appears to be the best choice. In addition to its atropine-like action, it causes less sphincter (Oddi) and duodenal spasm than morphine. This advantage may be lost, however, with increasing doses of meperidine. It has been used in combination with papaverine (2 gm, given intravenously) or nitroglycerin ($\frac{1}{100}$ – $\frac{1}{150}$ grains) to enhance the analgesic effect by reducing spasm. In patients who do not respond to meperidine, a 1% solution of procaine (20 ml), slowly given intravenously, may be of help. One must be alert to the possibilities of hypersensitivity and anaphylaxis when using this drug. Where pain continues, one may try an epidural block which provides bilateral anesthesia and anesthetizes both the cerebrospinal and afferent visceral fibers which come from the pancreas.

C. Suppression of the Pancreatic Secretion.—Basic to the successful treatment of acute pancreatitis is the suppression of the pancreatic exocrine secretion by curtailing the secretin mechanism. This is accomplished with (a) continuous gastric suction (with the possible exception of small amounts of antacid when the patient is able to take oral feedings), and (b) suppression of cholinergic stimulation with anticholinergic drugs. It has been our experience that methantheline (Banthine), 50 mg given intramuscularly every four to six hours; propantheline (Pro-Banthine), 15 mg given intramuscularly every six hours; atropine sulfate, 0.4-0.8 mg given every four hours intramuscularly; or tridihexethyl (Pathilon), 10-20 mg given every six hours intramuscularly, have been equally effective. Others have reported more potent inhibition of pancreas secretion with drugs such as pipenzolate (Piptal) and mepenzolate (Cantil) in doses of 5 to 25 mg given intramuscularly every six hours, respectively. The carbonic anhydrase inhibitor, acetazolamide (Diamox), has been used in doses of 250-750 mg/day in an effort to reduce the volume and bicarbonate concentration of pancreatic secretion.

D. Antienzyme Preparations.—Recently, antienzyme treatment preparations have enjoyed usage, especially in Europe. The criteria for the usage has been based on the idea that some of the deleterious effects of acute pancreatitis are due to the activation of pancreatic proteolytic enzymes and to the elaboration of biological reactive polypeptides, similar to bradykinin. It is proposed

BRING IT DOWN AND KEEP IT DOWN

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

that in acute pancreatitis trypsin stimulates the conversion of bradykiningen to bradykinin. It is this active principle which is responsible for local pain, vasodilatation, increased vascular permeability (leading to severe loss of fluid into the peritoneal cavity), hypotension, smooth muscle stimulation and the inflammatory reaction. The most popular and recent of these antienzyme preparations is Trasylol or Trasylol-Bayer A-128,* an antienzyme developed in Germany and demonstrated experimentally effective against the production of trypsin, kallikrien, chymotrypsin, and fibrinolysin. The initial enthusiasts reported mortality reduced considerably in acute necrotic pancreatitis when Trasylol was given intravenously. However, further studies in both the United States and Europe have been discouraging and report little change in mortality or morbidity. Recent laboratory experiments revealed that to be at all effective Trasylol must be given early in the course of the disease and in very large doses, exceeding 100,000 units daily. For this reason it may be effective in cases of acute pancreatitis found following surgery, in the patient who is already hospitalized.

E. Infection.—The role of infection in pancreatitis has been difficult to evaluate. It is not considered a common cause and for this reason the role of antibiotics in acute pancreatitis is uncertain. We have employed antibiotics (penicillin, streptomycin, the broad spectrum tetracyclines and, recently, sodium cephalothin [Keflin]) only in fulminating illness where there is evidence of superimposed infection, peritonitis, suppuration, and/or abscess formation. Under these conditions we feel that large doses are indicated.

F. Carbohydrate Metabolism.—Transient diabetes mellitus may be seen in 50% of cases of acute pancreatitis. This is usually transient in nature, but may less commonly proceed to diabetic acidosis. For this reason it has been recommended that 10 units of regular insulin be given with each 50 gm of glucose administered in 1,000 cc of water. Except in cases of shock we have preferred to give regular insulin subcutaneously every four to six hours on the basis of fractional urine coverage. It must be remembered that diabetic coma is rare in pancreatitis, but represents a catastrophic, almost uniformly fatal, event.

G. Steroid Therapy.—Although there have been isolated reports of increased survival rates following the administration of adrenocortical steroids in severe, acute pancreatitis, most investigators have been hesitant to use them. Steroids have been shown experimentally, and in humans, to cause pancreatic damage and to increase both pancreatic enzymes and biocarbonate concentration in early phases. For this reason we feel that steroids should be used only, if at all, in the acute stage of fulminating pancreatitis with vascular collapse.

H. Hypothermia.—Recent experiments have revealed an increased survival rate in dogs with acute hemorrhagic pancreatitis with generalized hypothermia. Others have reported increased pancreatic damage and enzyme secretion, secondary to cooling. We have not been impressed with the results seen in the few cases in which hypothermia has been employed in acute pancreatitis.

SURGICAL THERAPY OF ACUTE PANCREATITIS

As stated earlier, immediate surgical intervention is rarely indicated in acute pancreatitis. Certainly, no operation should be contemplated until the patient's cardiovascular system has been stabilized. With this in mind, emergency surgery may be undertaken: (a) only if such catastrophies as peritonitis, perforation, bowel obstruction, or vascular occlusion cannot be ruled out; (b) where there is clinical and laboratory evidence of abscess or pseudocyst formation (This may be extremely difficult and diagnosis can only be made with evaluation of the full clinical and x-ray picture); or (c) where jaundice fails to recede in an otherwise clinically improving patient. In the event surgery is performed and cholelithiasis is found, a cholecystectomy may be performed in the presence of mild pancreatic edema. The presence of an acute necrotic pancreatitis calls for a cholecystostomy with cholecystectomy deferred until the patient has recovered from his pancreatitis.

Although we have confined our remarks to the treatment of the acute pancreatitis itself, it should be mentioned that there are various complications of this illness which may require treatment. Among them are renal failure, massive ascites,

* Trasylol (made by Farbwerke Bayer, Leverkusen, Germany) appears to be a high-molecular-weight polypeptide, extractable from the parotid glands of cattle.

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®

(desipramine hydrochloride)

non-sedating • rapid-acting
ANTIDEPRESSANT

helps restore normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) often reverses the signs and symptoms of depression including sleep disturbances feeling of sadness, guilt, anxiety, worthlessness and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

PRODUCTS FOR PATIENTS YOU SEE EVERY DAY LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

splenic rupture, hepatic necrosis and congestion, and focal myocardial necrosis.

The duration of the intensive regimen described above should be determined by the clinical state of the patient. In the vast majority of patients who will recover from their illness, the convalescent stage is usually entered into in approximately five to seven days. Failure to respond in this period of time denotes a poor prognosis.

THERAPY FOR CHRONIC PANCREATITIS

Pancreatitis may be classified in the following way.

A. 1. Acute pancreatitis.
   2. Relapsing acute pancreatitis (pancreatic restitution takes place following the illness).

B. 1. Chronic pancreatitis.
   2. Chronic relapsing pancreatitis (residual pancreatic damage remains even though the patient may recover from recurrent episodes of acute inflammation).

MEDICAL THERAPY OF CHRONIC PANCREATITIS

The episodes of acute and chronic relapse in chronic pancreatitis are treated the same way initially as discussed previously for the acute pancreatitis with recovery. In the period of silence or remission following the acute exacerbation, efforts should be made to prevent additional seizures and further pancreatic damage. This should include: (a) a bland, relatively low fat and low roughage diet with avoidance of secretory stimulants to reduce gastric acid and secretion stimulation and (b) the avoidance of alcohol in patients with alcoholic pancreatitis.

There is no reliable evidence that the use of alcohol by patients with pancreatitis, secondary to biliary tract disease, enhances damage. However, we have impressed upon this type of patient the necessity for extreme moderation. Certainly, in those patients with alcoholic pancreatitis, all effort should be made to eliminate the use of alcohol.

In the presence of unmistakable pancreatic insufficiency, ie, steatorrhea, malabsorption, and diabetes mellitus, therapy must also be aimed at controlling these disturbances. We must preface all remarks, by saying that the medical as well as the surgical treatment of chronic pancreatitis and pancreatic insufficiency represents at this time a tremendous challenge to the physician. It is often extremely frustrating and, worse, only partially successful.

The dietary restrictions as described above, must be modified to compensate for the nitrogen loss in the stools. We believe that a diet containing 150 gm of protein per day should be taken. Dietary fats should be limited to approximately 50 gm or less per day. Because of the poor hydrolysis in pancreatic insufficiency, the presence of dietary fat in large amounts tends to increase diarrhea.

Pancreatic enzyme substances in the form of nonenteric-coated viokase (0.5-1 gm) and triple strength pancreatin (2-5 gm) should be employed when there is evidence of steatorrhea. Because of the mechanics of digestion, these enzymes should be given every hour while awake for best results. One may add bile salts to the regimen to assist in fat digestion. There may be a deficiency of the fat-soluble vitamins A, D, E, and K. These may be administered in water-soluble preparations, to be taken orally or parenterally if necessary. Calcium supplementation in the form of large oral doses of calcium gluconate (6-12 gm daily) may also be necessary.

Iron deficiency anemias are uncommon in chronic pancreatitis except following an acute attack. Indeed, iron absorption appears to be increased in chronic and calcific pancreatitis. The use of pancreatic enzyme derivatives actually decreases the absorption rate. However, in the late stages of the illness, severe steatorrhea may be associated with a deficiency in iron absorption. In these cases parenteral iron supplements such as iron dextran injection (Imferon) should be used. After an initial loading, calculated on the basis of the patient's weight and deficit, one may give additional increments of 4 cc intramuscularly every six months.

Recent investigations have revealed that exocrine pancreatic function is essential for the normal absorption of vitamin B_{12} and folic acid. For this reason it may be necessary to supplement the diet in chronic pancreatitis with folic acid, 5-15 mg/day, followed by 5 mg/day, and cyanocobalamin, 30 mg administered intramuscularly on a monthly basis.

Perhaps the most difficult aspect of the management of chronic pancreatitis is that of control

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

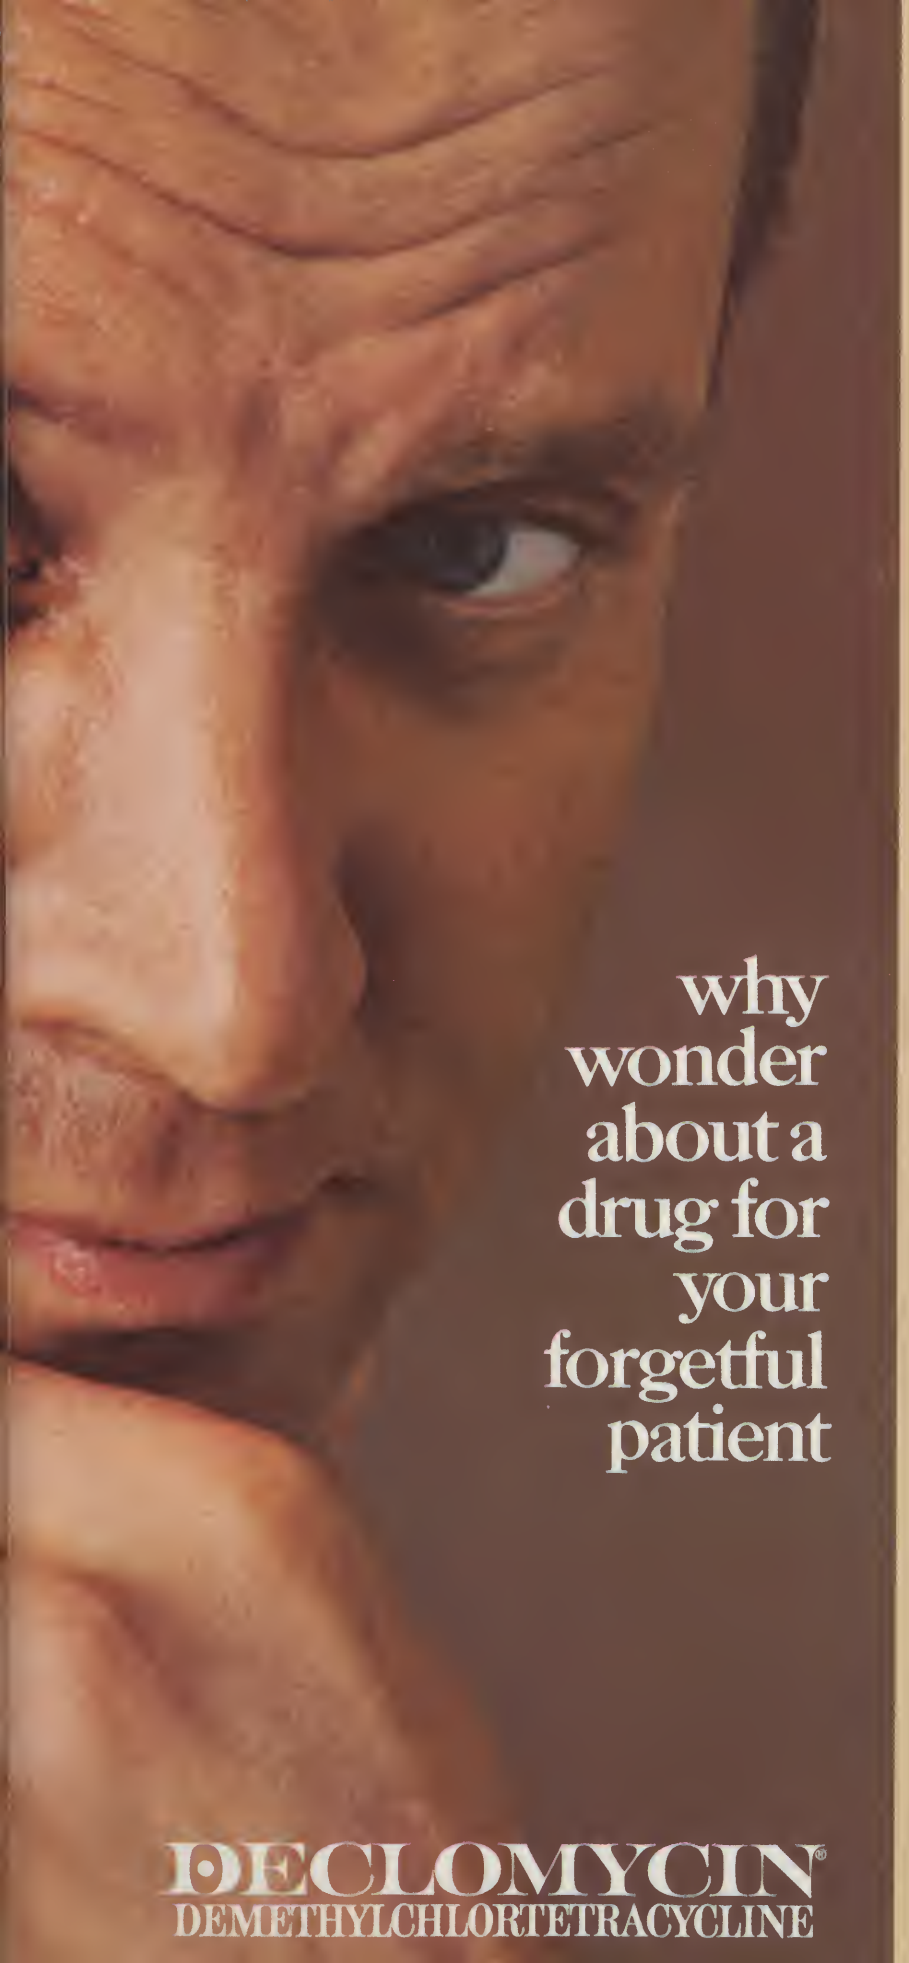
each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

of pain. It may become extremely difficult to evaluate the psychophysiological aspect of pain in chronic pancreatitis. Its very chronicity makes it one of the most demoralizing forms of discomfort. The keystone of analgesic therapy is the avoidance of the use of opiates since these patients are extremely susceptible to addiction. Tranquilizers (ie, chlordiazepoxide [Librium], meprobamate [Equanil, Miltown], diazepam [Valium], etc), barbiturates, and anticholinergics should be tried initially. All of the nonopiate analgesics should be employed, although there is relatively little likelihood of their success. We have found the combination of phenothiazine derivatives, such as promazine (Sparine), 50 mg t.i.d., promethazine (Phenergan), 25 mg t.i.d., and perphenazine (Trilafon), helpful in enhancing the effect of various analgesics. When the need for a narcotic eventually arises, we have used a mixture of oxycodone hydrochloride, oxycodone terephthalate, homatropine terephthalate, aspirin, phenacetin, and caffeine (Percodan) or codeine first in conjunction with the above mentioned drugs because they are less likely to cause addiction. We have found that a patient and understanding, but firm clinical approach is much more successful in handling the emotional trauma of this disease than is formal psychiatric therapy.



SURGICAL THERAPY OF CHRONIC PANCREATITIS

The surgical approach to chronic pancreatitis has also been something less than successful. The great variety of procedures advocated attest to the lack of uniform success with any one or group of procedures. The type of surgical approach is dictated by the problem. In general, the following are reasons for surgical intervention in chronic pancreatitis: (a) development of pancreatic pseudocyst or peripancreatic abscess, (b) relief of intractable pain, unrelieved by conservative measures, (c) continuing jaundice and/or biliary tract disease, (d) evidence of mechanical obstruction to the outflow of pancreatic juice to account for recurrent attacks and (e) the possibility of pancreatic carcinoma. It is not the purpose of this paper to give a discourse on the surgical management of the problems of chronic pancreatitis, but since it is usually the medical physician who is called on to initiate surgical consultation, a knowledge of the procedures available is important.

The complications of pancreatic pseudocyst were originally handled through external drainage in the poor-risk patient, but recently, internal drainage via a cystogastrostomy or cystjejunostomy has proved more successful, especially in avoiding chronic external fistula formations. Many surgeons advocate sphincterotomy be performed at this time.

If there is suspicion of biliary disease, exploration of the choledochal-sphincteric area is essential. The patient should undergo preoperative intravenous cholangiogram while on the operating table. In those cases where blockage of the ampulla is indicated and demonstrated by failure to pass a 3-5 mm sound easily through it, sphincterotomy is indicated. The pancreatic duct should then be cannulated and a sample of pancreatic juice taken. If there is any doubt as to the patency of the duct, a retrograde pancreatogram should be made. If there are no serious abnormalities of the pancreatic duct, the transduodenal sphincterotomy may be successful in relieving symptoms in 50% of cases. If a single or few

why wonder about a drug for your forgetful patient

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE

-more convenient

-more easily remembered

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE 300 mg FILM COATED TABLETS
are made for b.i.d.

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

Lederle LEDERLE LABORATORIES
A Division of American Cyanamid Company, Pearl River, New York
422-6-4071

large calculi are found within the pancreatic duct, a pancreaticolithotomy may relieve obstruction. More commonly, however, multiple sites of obstruction are present. This may necessitate a partial pancreatic resection of the distal pancreas with pancreaticojejunostomy providing drainage of the pancreatic duct into the jejunum. Choledochojejunostomy with Roux-Y procedure may be used when there is concomitant common duct obstruction. The procedure of pancreaticoduodenectomy is a difficult one and has been used mainly where there is overwhelming destruction of the pancreas and intractable symptoms. Those patients who do survive the procedure present extremely difficult medical management problems with respect to their nutrition and diabetes mellitus. We feel that this procedure is rarely indicated.

Finally, the least successful of all pancreatic surgery is that which is specifically directed toward relieving intractable pain. A variety of procedures including thoracolumbar sympathectomy, splanchnicectomy, vagotomy, and celiac ganglionectomy have been performed. By and large results have been poor. One must remember that in advanced pancreatitis the cerebrospinal nerve endings also transmit pain impulses from the pancreas.

There are few diseases which call for more skill on the part of the clinician than does chronic pancreatitis. With or without surgical intervention, the results are rarely successful.

Part II. Regional Enteritis

Regional enteritis may be defined as a slowly progressive, chronic, nonspecific, inflammatory illness without known cause. It may involve the alimentary tract from the stomach to the ileocecal valve. Indeed, pathologic changes in the colon are being described with increasing frequency. While the overall mortality of regional enteritis is quite low (2%), it presents difficult problems in management for the clinician because of the disability that it can produce. This is compounded by the uncertainty among many physicians as to what can be accomplished and what are realistic goals for the patient with regional enteritis.

MEDICAL MANAGEMENT

The treatment of regional enteritis is essentially medical, although a majority of patients will eventually come to surgery. Of the 542 patients with regional enteritis, followed in the Mount Sinai Hospital series, nearly 80% eventually underwent surgical intervention. The acute phase of ileitis may often be mistaken for appendicitis and may come to surgery. If during the operation the cecum and appendix are found to be uninvolved, it may be prudent to proceed with an appendectomy, thus removing a future source of difficulty in differential diagnosis. However, if the inflammatory process is severe, with mesenteric thickening and involvement over the cecum or the appendix, the operation should be terminated without corrective surgery.

We may divide the medical therapy of enteritis into the broad categories of general and specific therapeutic measures.

A. General Therapeutic Measures.—Physical rest is one of the most effective and necessary aspects of medical treatment. It may require bed rest with bathroom privileges initially, and restricted physical activity for weeks or months. Certainly, in the acute stages of the illness, the physician should be guided by temperature, relief of pain, cramping and diarrhea, weight improvement, correction of anemia, electrolyte and protein balance, and white blood cell counts in regulating

out-of-bed activity. We have found that relief of the acute symptoms can be rarely accomplished in less than 10-14 days. Along with physical rest, emotional rest is vitally important. Relief from worry, tension, and pressing responsibilities helps greatly in speeding recovery. We have found the barbiturates (phenobarbital, 30 mg t.i.d.) or tranquilizing drugs in moderate doses to be effective. Less often, the antidepressives or phenothiazine derivatives (trifluoperazine [Stelazine], 2 mg, once a day) have been necessary.

The control of diet is basic to the treatment of regional enteritis. It plays a most important role in relieving pain and diarrhea. Above all, it must be nutritious and pleasing to the patient. Because of the protein loss, a high protein (100-120 gm) diet is indicated. Irritating high residue and gas forming foods must be avoided. This will allow most meat products. Raw fruits and vegetables (except bananas), pies, fried foods, pastry, bran, nuts, spiced foods, fermented alcoholic beverages, whole-grain wheat cereals, lentils, onion, garlic, pickles, rye crisp, lettuce, celeries, etc. sould be removed from the diet. Such gas-forming foods as legumes, cabbage, shell fish, and iced cold or very hot drinks are to be avoided. Some patients may have increased diarrhea with uncooked milk. This may be due to interference with lactose digestion and absorption, secondary to the regional enteritis. These patients will generally be able to tolerate milk products in the cooked state.

In addition to diet, there are vitamin and mineral supplements which will be needed, depending upon the area of the bowel involvement. In over 60% of patients with regional enteritis there is decreased vitamin B_{12} activity due to involvement of the terminal ileum. This may be expressed in the form of a megaloblastic anemia and usually responds well to cyanocobalamin in doses of 1,000 μg, administered intramuscularly, every three months following the initial loading dose. The restriction of fruit may well affect vitamin C levels, and it is wise to supplement the diet with ascorbic acid in doses of 100 mg three times a day. The presence of severe diarrhea may produce deficiencies in the fat-soluble vitamins A, D, E, and K. This may be remedied with the use of multivitamin tablets daily, vitamins A, D, and E, and the use of a water-soluble analog of vitamin K, such as phytonadione (Aqua Mephyton) in doses of 2.5 to 25 mg daily. Potassium (K-triplex, 5 cc t.i.d.) and calcium (calium lactate, 12 gm day in divided doses) with water-soluble vitamin D (calciferol, 50,000 units three times a day given orally) may be indicated.

In addition to the anemia associated with B_{12} deficiency, the patient with regional enteritis almost universally will present with an iron-deficiency anemia, secondary to chronic blood loss. This may be replaced with the use of various iron preparations, including ferrous sulfate and ferrous gluconate. In the event that the oral preparation cannot be tolerated, parenteral iron in the form of iron dextran injection (Imferon), replaced according to body weight and hemoglobin deficit should be given intramuscularly. The various iron preparations with enteric coated capsules may be less irritating to the gastrointestinal tract, but they are much less reliable in terms of iron absorption. When there is extensive involvement of the jejunum and duodenum, folic acid deficiency may be a problem and may necessitate parenteral and oral folic acid replacement.

Pain, especially in the form of middle and lower abdominal cramping, may be greatly relieved by the proper use of diet. In addition, the salicylate analgesics and propoxyphene hydrochloride (Darvon) may be helpful when augmented by the use of anticholinergics such as methantheline (Banthine) or propantheline (Pro-Banthine). Tincture of belladona in doses of 12-22 drops before meals has been found effective. The use of narcotics should be avoided if at all possible, although severe cramps will usually respond to moderate doses of codeine. This should be withdrawn quickly to prevent constipation.

Diarrhea, which is usually of the nonbloody type is also greatly reduced by the proper diet. In addition, the psyllium hydrophillic mucilloids (Metamucil, Konsyl, etc) in doses of 2-3 teaspoons, in fluid daily, can be quite helpful. They tend to decrease the fluidity of the stool and prevent anal and perianal irritation. In those cases requiring further therapy, denatured tincture of opium (8-15 drops every four to six hours) or diphenoxylate hydrochloride with atropine (Lomotil) in doses of 2.5 to 5 mg, four times a day may be used.

B. Specific Therapeutic Measures.—Antibiot-

ics: There is no proof that regional enteritis is caused by infection. Nevertheless, the acute disease often will respond, at least transiently, to either antibiotics or steroids. In addition, secondary bacterial invasion may be avoided. The most effective agents are the nonabsorbable sulfonamides and of these the one most frequently used is salicylazosulfapyridine (Azulfidine). This drug is apparently less successful in regional enteritis than in ulcerative colitis but may suppress the inflammatory state and prevent secondary bacterial infection. It may be given orally in doses of 1 to 1.5 gm, four times a day. Patients treated with salicylazosulfapyridine must be watched for possible blood dyscrasias or allergic reactions. Because of the high incidence of gastrointestinal intolerance, it may be necessary to switch to the less irritating sulfonamides such as succinylsulfathiazole (Sulfasuxidine) or phthalylsulfathiazole (Sulfathalidine), in doses of 1.5-2 gm, four times a day. We have found it best to keep our patients on the sulfonamides for approximately two to three months, abruptly withdrawing the drug if the patient is in remission.

Steroids: The role of adrenocortical steroids in the treatment of regional enteritis continues to be empiric. There is no real proof of permanent curative value in this illness, but one can give striking symptomatic temporary improvement. Though there is no conclusive evidence of increasing perforation with the use of adrenal steroids, one does see the usual complications with long-term use and for this reason it is to be avoided. Perhaps the greatest value of adrenal steroids is in the treatment of the extra alimentary manifestations of regional enteritis such as arthritis, uveitis, pyoderma, and erythema nodosom.

We have obtained best results in the acute phase of regional enteritis with the use of corticotropin. It may be given by intravenous drip daily in doses of 20-40 units in 1,000 cc of 5% dextrose and water over eight hours, for a period of seven to ten days. This may be followed by intramuscular injection or switching to the adrenal corticosteroids. Initial intramuscular administration of aqueous corticotropin in doses of 30 units every six hours may be used, with a gradual reduction over a period of 7-10 days to 40 units daily. We have initiated the simultaneous use of salicylazosulfapyridine in our patients. In those who have responded very rapidly, we have attempted to withhold adrenal steroids following ten days of corticotropin therapy. This has rarely been successful. In the majority of patients we have either begun with or followed corticotropin with orally administered adrenal steroids, ie, prednisone, administering orally 30 mg/day in divided doses, with gradual reduction of the dose after the first week. In order to avoid the complications of steroid usage, we have tried to withdraw them completely from our patients over a period of two to three months. However, many patients will require a longer course and/or recurrent therapy. Those patients undergoing surgery who have had adrenal steroids within the previous 9 to 12 months should receive steroids on the day prior to, and following the surgery as well as on the day of the operation. We have given 100 mg of hydrocortisone sodium succinate intramuscularly in divided doses on the day prior to and on the day of surgery. We have followed this with tapering doses over a two to three day period following surgery.

SURGICAL TREATMENT OF REGIONAL ENTERITIS

As we have stated earlier, the majority of patients with regional enteritis will require surgical intervention. Surgery is indicated for the following reasons: (a) the outright failure of medical management with continued fever, sepsis, internal fistulas, and perianal and perirectal fistulas and abscess formations, (b) intestinal obstruction, the most common cause for surgery, usually resulting from cicatricial constriction, (c) perforation, a very rare finding in enteritis, and (d) the need to establish a diagnosis. One should try to operate at a time when nutritional status is at a maximum. Surgery should not be held out as the last resort, waiting until the patient is nutritionally bankrupt. The prevailing opinion today is that resection with end-to-end anastomosis is preferable to the previously used short-circuiting procedures. If the patient is severely debilitated or has burned-out disease with acute obstruction, a lower risk bypass procedure may be indicated. Since the great majority of cases of regional enteritis involve the terminal ileum, the most common surgical procedure today is removal of the distal ileum and cecum with a cuff around the

inflamed area, forming an ileotransverse colostomy. Unfortunately, recurrences are all too frequent, usually at the site of anastomosis. In the Columbia-Presbyterian Hospital series, there was 19% incidence of recurrence at two years, 26% at five years, and 42% at ten years. The overall recurrence rate following surgery of regional enteritis is approximately 50%. Nevertheless, excessive pessimism is not indicated since many patients will experience sustained remission for many years.

In summary, the eventual therapeutic approach to regional enteritis is most likely to be both medical and surgical. If both the physician and patient are realistic in their goals, they will be cheered by the knowledge that although this is a chronic, progressive disease, the majority of patients do experience long periods of remission and relative well-being and productivity with the help of intelligent medical and surgical care.

Now, now, Mrs. Forsythe, we've never lost a cold patient yet.

When she's experiencing acute discomfort from cold symptoms, it's small wonder the patient becomes distressed about her condition.

She will breathe easier when you prescribe Novahistine LP. Novahistine LP is a long-acting decongestant that helps restore normal mucus secretion and ciliary activity—physiologic mechanisms which prevent infection of the respiratory tract. A dose of two tablets taken in the morning and repeated in the evening will usually keep air passages clear for 24 hours.

Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution patients who operate machinery or motor vehicles that drowsiness may result.

Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

PITMAN-MOORE Division of The Dow Chemical Company, Indianapolis DOW

NOVAHISTINE® LP

For relief of nasal congestion.

arrest diarrhea

LOMOTIL®

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride . . . . . 2.5 mg.
(Warning: May be habit forming)
atropine sulfate . . . . . 0.025 mg.

Effectiveness: Lomotil possesses a unique degree of effectiveness in both acute and chronic diarrhea.

Convenience: Lomotil is supplied as small, easily carried, easily swallowed tablets and as a pleasant, fruit-flavored liquid.

Versatility: The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or as adjunctive therapy in diarrhea associated with:

- **Ulcerative colitis**
- **Acute infections**
- **Irritable bowel**
- **Regional enteritis**
- **Drug therapy**
- **Food Poisoning**
- **Functional hypermotility**
- **Malabsorption syndrome**
- **Ileostomy**
- **Gastroenteritis and colitis**

Dosage: For correct therapeutic effect—Rx correct therapeutic dosage. The recommended initial daily dosages, given in divided doses, until diarrhea is controlled, are:

Children: Age	Total Daily Lomotil Dosage	Lomotil Liquid Dosage (Each teaspoonful [4 cc.] contains 2 mg. of diphenoxylate HCl)
3-6 months	3 mg.	½ tsp. 3 times daily
6-12 months	4 mg.	½ tsp. 4 times daily
1-2 years	5 mg.	½ tsp. 5 times daily
2-5 years	6 mg.	1 tsp. 3 times daily
5-8 years	8 mg.	1 tsp. 4 times daily
8-12 years	10 mg.	1 tsp. 5 times daily

Adults: 20 mg. (2 tsp. 5 times daily or 2 tablets 4 times daily) Based on 4 cc. per teaspoonful. Maintenance dosage may be as low as one-fourth the initial daily dose.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Recommended dosages should not be exceeded. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

Everyone says she's a barrel of fun

But what does she think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextro-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovasculor disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

Breast-feeding and the "modern mother"

Despite a mild resurgence of interest in the importance of breast-feeding a few years ago, many women today do not choose to nurse their young. This is for a variety of reasons—social, economic, cultural and sometimes medical. In such cases the physician's task is to find the most suitable means of preventing lactation and easing the pain of breast engorgement.

The means of therapy

The value of hormone therapy for this indication is of course well established. Both androgen and estrogen are known to inhibit the production and secretion of the lactogenic hormone by the anterior pituitary. As estrogen levels decline sharply at parturition, lactogenesis is established. When androgen and estrogen are administered to the patient before the release of the lactogenic hormone lactation and breast engorgement are usually prevented.

The time of therapy

The time of administration of this combined medication is crucial; it must be given early enough to suppress the pituitary prolactin and last long enough to permit physiologic readjustment during the puerperium. Excellent results are most often seen when therapy is administered before the onset of the second stage of labor.

However, factors other than effectiveness must also be considered. The agent selected should not interfere in any way with parturition, subsequent uterine involution and the restoration of normal ovarian cyclic function. Furthermore, it should not cause rebound breast engorgement or other manifestations of hormonal imbalance.

A balanced formulation

Providing single-dose therapy for the prevention of lactation and breast engorgement, Deladumone OB is a potent androgen-estrogen combination with a prolonged action. The optimal balance of androgenic and estrogenic hormones achieved in this preparation minimizes the disadvantages inherent in single hormone therapy, such as rebound breast engorgement. Involution of the uterus and resumption of menstrual cycles are not affected.

As reported in a recent published study (Roser, D. M.: Obstet. & Gynec. 27:73, 1966), Deladumone OB provided good suppression of breast engorgement in 95.3% and suppression of lactation in 81.1% of 86 obstetrical patients. These results are in general agreement with those of many earlier investigations; in several studies this injectable androgen-estrogen combination proved to be superior to oral medication.

Dosage:

As a single injection of 2 cc. before the onset of the second stage of labor.

Contraindications:

Established or suspected mammary cancer or genital malignancy.

Precautions and Side Effects:

Certain patients may be unusually responsive to either estrogenic or androgenic therapy. In such individuals virilization, uterine bleeding or mastodynia may occur.

Supply:

Deladumone OB, providing 180 mg. testosterone enanthate and 8 mg. estradiol valerate per cc., is available in 2 cc. Unimatic® disposable syringes and in 2 cc. vials. Both preparations are dissolved in sesame oil, with 2% benzyl alcohol as a preservative. *Before use, consult product literature for full prescribing information.*

Deladumone® OB

Squibb Testosterone Enanthate (180 mg./cc.) and Estradiol Valerate (8 mg./cc.)

Single-dose injection for lactation inhibition

INFLAMMATORY DISEASES OF BONES AND JOINTS

JERRY C. HUNT, MD
Assistant Professor of Orthopedic Surgery
University of Maryland School of Medicine

Inflammation is a tissue reaction to injury. This reaction is characterized by increased vascularity and clinically manifested by heat, redness, swelling, and tenderness. The mechanisms of injury are varied. They all have the common factor of producing an insult to the tissues, thus eliciting an "inflammatory" response. The subsequent pathophysiology is characteristic for the particular injurious agent.

Injury eliciting an inflammatory response in bones and joints can be sustained by five distinct mechanisms.

1. *Trauma.*—In this instance trauma of an acute nature, typified by a synovitis of the knee or wrist following a severe sprain. Ligamentous sprain, pinching of the synovium, and frequently a secondary hemarthrosis invoke an inflammation of the synovium.

2. *Mechanical Stress.*—This is actually chronic trauma. There are two distinct types. The first is preceded by an alteration of anatomy from whatever cause, and the repeated trauma of one structure against another produces an inflammatory response. As an example, malunion of a fracture may leave a bony protuberance across which a tendon repeatedly glides. A bursa develops and becomes inflamed, or the tendon itself becomes inflamed. Commonly involved are the hamstring and wrist extensor tendons. Occasionally, this condition is produced by trauma to a tendon from an external source, such as the Achilles tendon against the top of a ski boot or high-top shoe, or the hamstring tendons against an improperly applied short leg cast. The second type of mechanical stress injury is better termed "attrition," by which we mean either the normal wear and tear process of daily use, such as degeneration of the rotator cuff of the shoulder, or excessive repetition of a certain motion producing a typical inflammation, such as "tennis elbow" and de Quervain's disease (of the thumb).

3. *Infection.*—Bacterial seeding of bones and joints causes a chain of injuries to the tissues manifest initially as inflammation.

4. *Neoplasia.*—Bone tumors may evoke an inflammatory response, but it is usually related to tumor necrosis. A fast growing tumor simply outgrows its blood supply, producing necrosis and an inflammatory tissue response to the necrotic material.

5. *Metabolic Bone Disease.*—These disorders may produce inflammation, but as with neoplasia, they comprise a very small percentage of inflammatory diseases. Examples are the vitamin deficiencies and excesses.

This classification is not complete. Excluded is an exhaustive list of entities unlikely to be encountered even over a period of years. My

Read before the Spring Scientific Assembly of the Maryland and District of Columbia Academies of General Practice, May 21, 1966.

purpose is to discuss commonly occurring bone and joint problems manifest by the cardinal signs of inflammation: heat, swelling, redness, and tenderness.

Bursitis and Tendinitis.—The most frequently seen inflammatory conditions are problems conveniently lumped under the general diagnosis of "bursitis." There are numerous bursae, almost everywhere a tendon crosses a bony prominence or joint. Any alteration of this smoothly gliding mechanism produces a mechanical injury to the bursa, tendon, or both. The bursal reaction to injury is swelling, tenderness, heat, and redness. The most commonly affected are the subacromial bursa of the shoulder, the olecranon bursa at the elbow, and the trochanteric bursa of the hip. History and physical examination should easily lead to the diagnosis.

The single most common inflammatory condition in orthopedics involve the shoulder. The subacromial bursa lies in the narrow space between the supraspinatus tendon and the acromion. The rotator cuff of the shoulder glides over the humeral head and under the acromion, being separated from each by the synovium of the joint and the subacromial bursa, respectively. With the arm at the side, the space between the humeral head and acromium easily accommodates the intervening structures. As the shoulder is abducted this space becomes narrowed. As 60° to 70° of abduction is reached, there is a relative mechanical impingement of the supraspinatus tendon and subacromial bursa.

Attritional injuries to the supraspinatus tendon or repetitive motion may produce inflammation of the bursa. With attendant swelling of the bursa, the narrow interosseous tunnel produces still further impingement. When the bursa is inflamed and distended, the impingement upon motion is exquisitely painful. In time, calcific deposits appear in the supraspinatus tendon, causing further incitement of inflammation and increasing the bulk of the tissue attempting to glide between the humeral head and acromium.

Treatment is fairly well standardized. Cold compresses and rest are mandatory when tenderness is prominent. This may suffice. More often, improvement is slow. We rely heavily on the sterile aspiration of the bursa, followed by the instillation of one of the steroid preparations especially prepared for intraarticular injection. There is a new anti-inflammatory drug, indomethacin (Indocin), available which we have used for ten months with good results in the treatment of bursitis and tendinitis at various locations in the body. We have had no untoward side effects. Surgery is indicated for subacromial bursitis failing to yield to conservative measures. This usually consists of excision of the bursa, excision of calcific deposits, and repair of attritional injuries of the rotator cuff. Rarely, subtotal acromionectomy is required, but when done, it yields excellent results.

Calcific deposits may remain asymptomatic after the acute inflammation has subsided, in which event, we do not interfere. Occasionally, the calcific deposits will fragment and reabsorb with ultrasound therapy.

Another shoulder structure, the long head of the biceps humeri, frequently becomes inflamed. The tendon is restrained in the bicipital groove by a transverse ligament and is enclosed in a synovium-lined sheath. Inflammation produces swelling of the sheath and impingement of the tendon on motion. Local injection of steroids and administration of indomethacin have proven effective. We have not had occasion to operate for bicipital tendinitis.

The conservative modalities of treatment already discussed are apropos to the management of bursitis of the olecranon and trochanteric bursae. Operative treatment varies somewhat. In the case of the olecranon bursa, simple excision is all that is required, but skin closure and wound healing are complicated by the subcutaneous position of the ulna and motion of the elbow. The most common underlying cause of trochanteric bursitis is the presence of an orthopedic bone appliance used in the treatment of a previous hip fracture. If the fracture is healed, removal of the metal appliance facilitates control of the bursitis.

"Tennis elbow" is a lateral epicondylitis of the elbow near or at the origin of the common extensor mass of the forearm. Conservative treatment as outlined has proved satisfactory, and we have not had to resort to operative treatment of this condition.

In addition to bicipital tendinitis, another commonly affected tendon group are the abductor pollicis longus and the extensor pollicis brevis at

the anatomical snuff box. This condition is known as de Quervain's stenosing tenosynovitis. It responds well to rest, immobilization, and local instillation of steroids. Indomethacin has proven effective in this condition, especially when combined with the local instillation of steroids. Conservative treatment occasionally does not suffice. In this event, simple decompression of the common sheath of the two tendons by slitting it longitudinally is curative.

Rheumatoid arthritis is an inflammatory condition of joints, tendons, and supporting structures. The inflammatory response is usually intense. Joint synovium proliferates and encroaches upon the joint cartilage, eroding cartilage and subchondral bone. Secondary deformities occur, increasing the disability of the affected joints.

Synovial masses may commonly appear on the volar and dorsal surface of the wrists, the dorsum of the hand, the metacarpophalangeal, and proximal interphalangeal joints of the hand and the knee joint. Upon exploration, these masses are seen to be acutely inflamed and characteristic of rheumatoid synovitis. After excision of this rheumatoid synovium and pannus, joint destruction is usually found to be more extensive than suspected. Tendons are eroded; and some are ruptured. Articular surfaces are denuded of hyaline cartilage with loss of joint space and subluxation of joints. Bone matrix may be absorbed due to the hyperemic osteoporosis present.

Management of the rheumatoid arthritic patient is properly in the hands of the qualified generalist and internist. We see patients in surgical consultation and feel that we have something to offer them. In the early proliferative stage, we have found that injection of thiotepa (Thio-tepa) into the involved synovial cavities reduces the synovitis, improves the symptoms, and possibly averts joint destruction. This failing, we feel that early operative synovectomy is indicated. Once gross secondary deformities occur, reconstructive surgery is of benefit, but the opportunity to preserve function has been lost.

Osteomyelitis and Pyarthrosis.—The enigma of the orthopedic surgeon and of the family physician is osteomyelitis. Pyarthrosis is an equally foreboding problem. The earliest pathological changes in both of these conditions is inflammation. By whatever route access is gained, bacteria are seeded either into the joint cavity or into the metaphysis of a long bone. The bacterium is the insulting agent and the tissues respond with increased vascularity. With increased vascularity, there is tissue edema and hemostasis in the blood sinusoids of the metaphysis. This provides an excellent growth medium for bacteria, and with bacterial growth there is accumulation of pus. Increased pressure within the cortex of the bone leads to further bone necrosis. As the pressure increases, there is not only bone necrosis, but also a decrease in the blood supply. More importantly, it is difficult to deliver an antibiotic into the area.

Acute hematogenous osteomyelitis may be a difficult diagnosis to make. Nevertheless, the acutely ill child with fever, malaise, and bone or joint tenderness should be treated as a medical emergency until osteomyelitis and pyarthrosis have been proven not to be present. Supportive therapy in the form of rest, nutrition, and adequate blood replacement must be maintained. Blood cultures should be obtained on each occasion that the child spikes a fever until diagnosis is obtained. Needle aspiration of the involved joint or the periosteum in an osteomyelitis may produce the diagnosis if the lesion is well-localized. Once cultures are obtained, large doses of penicillin and sodium methicillin or other semisynthetic pencillin effective against penicillinase-producing organisms should be administered. Subsequent to a confirmatory culture, the inappropriate antibiotic can then be discontinued. If the child remains acutely ill after 12 to 24 hours of appropriate therapy, then surgical decompression is indicated in osteomyelitis. In the case of staphyloccal pyarthrosis, arthrotomy is indicated as soon as the diagnosis has been made. We continue antibiotic therapy for a six-week period subsequent to the lysis of fever.

Summary

We have demonstrated that inflammation of bones and joints is simply a reaction of that tissue to an injurious agent. The inflammatory response is characterized by a local increase in vascularity. Secondarily, swelling, increased heat, erythema, and tenderness are clinical manifestations of the tissue reaction.

General management of all inflammatory conditions consists of rest, immobilization of the injured

only one in the morning

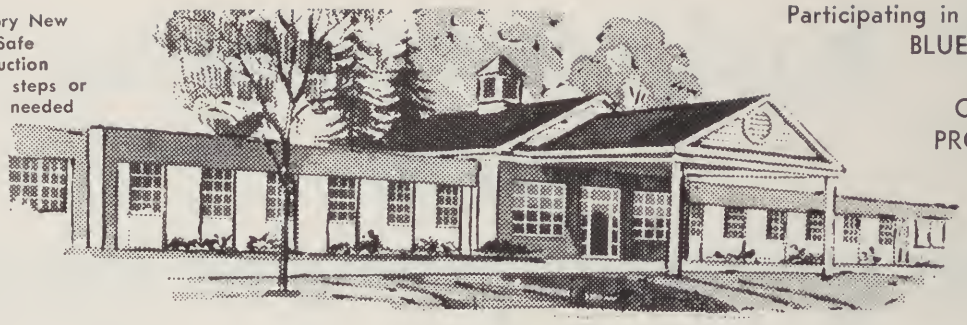
ell tolerated. Tetrex (tetracy-ne phosphate complex) is well lerated. Gastrointestinal side fects are few; photodynamic actions are extremely rare.

More of the active antibiotic in the blood. The basic tetracycline in Tetrex (tetracycline phosphate complex) is less bound to serum protein than is demethylchlortetracycline.[1] Result: Tetrex (tetracycline phosphate complex) provides a higher percentage of active antibiotic in the blood.

Available in bottles of 16 and 50.



BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms. *Contraindications:* The drug is contraindicated in individuals hypersensitive to tetracycline. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Mycotic or bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis and allergic reactions may occur. *Usual Adult Dose:* 500 mg. b.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.

part, application of cold compresses, and appropriate analgesia. Beyond these general measures, the treatment instituted must be individualized for the particular offending agent that has produced the inflammation.

In noninfectious conditions, the local instillation of steroids, aspiration of transudates, and use of anti-inflammatory drugs are of benefit. Occasionally, operative treatment is required to effect lasting relief. Treatment may be excision of bursae, excision of calcific deposits, removal of bone spurs and ridges, removal of metabolic implants, and release of constricting structures such as stenosing tendon sheaths and restrictive fascial bands.

In the rheumatoid arthritic, standard rheumatological drugs are recommended. In addition, joint instillation of cytotoxic poisons may effect a so-called chemical synovectomy. If the inflamed synovium does not respond to these measures, serious consideration for surgical synovectomy is indicated to preserve joint function and protect the surrounding soft tissues, especially the tendons.

In infectious inflammatory conditions of bones and joints, an emergent and vigorous therapeutic regimen is mandatory. Cultures of the offending organisms must be obtained by either blood cultures, aspiration of the lesion, or surgical decompression, and massive antibiotic therapy must be initiated and continued sufficiently long if cure is to be effected and chronic infection with its accompanying skeletal impairment is to be avoided.

History of the Baltimore City Hospitals

BY DOUGLAS CARROLL, M.D.

Chapter 10.—The Baltimore City Hospitals Under Full-time Chiefs: Beginnings of Community Medicine. (1956-1966)

The record shows rather distinctly that the best medicine is practiced by salaried physicians in teaching hospitals, the best research is done by salaried physicians in government, university, hospital and industrial laboratories, and that salaries are no more dangerous to medicine than to nursing, engineering, soldiering, the courts, or the schools.[1]

With the appointment of the full-time chiefs and the increasing participation of the medical students in the middle 1950's, came a dramatic improvement in the number and quality of housestaff at the Baltimore City Hospitals. Research activities were developed on most of the services.

Since the close of the Sydenham Infectious Disease Hospital in 1950, the Baltimore City Hospitals had been the infectious disease hospital for Baltimore. All of Maryland's poliomyelitis patients were cared for at the Baltimore City Hospitals.[2] During the late 1950's and early 1960's, a number of exciting new discoveries and techniques were developed and put into use at the Baltimore City Hospitals.

The development of the Salk poliomyelitis vaccine in the late 1950's made the study of the poliomyelitis epidemic of 1960 of particular interest. Because of improvement in the diagnosis of poliomyelitis by the development of methods to identify the virus, only three cases of nonparalytic poliomyelitis were identified. Compared to previous epidemics of poliomyelitis, the epidemic of 1960 was particularly severe with widespread involvement of muscles. Twenty-five patients required tracheostomy and 24 had intermittent positive pressure ventilation. Ten patients had severe respiratory insufficiency, of whom six remained apneic at the end of three months. Seven patients died from bronchopneumonia, atelectasia or aspiration pneumonia. One patient has remained completely apneic and still requires artificial respiration.

In 1960, for the first time in the United States, the iron lung type respirator was completely replaced at the Baltimore City Hospitals by the use of positive pressure ventilation of the Moerch or Bennett type. This method of ventilating apneic patients was feared by many physicians familiar with the use of the Drinker respirator. During its development at the Baltimore City Hospitals, under the direction of the chief of anesthesia, Dr. Peter Safar, the advantages over the iron lung became evident. The patient could be reached easily by the nursing service and by the physical therapist, and felt far more comfortable and less claustrophobic. After 1960, the effectiveness of the Salk vaccine became evident, and the terrible epidemics which had plagued the world previously were eliminated.

Development of the positive pressure ventilation method of caring for apneic patients brought about the institution of an intensive care unit at the Baltimore City Hospitals. In this unit, special facilities were developed, such as respirators, piped-in oxygen, suction, monitors of various sorts with special nurses around-the-clock. This

was the first intensive care unit in the United States in which patients from any service with any acute disease could be admitted at the discretion of the housestaff.[3] The patients were cared for by the physician from the specialty service. The Department of Anesthesia, under Dr. Safar, acted as consultants on patients with respiratory problems in the intensive care unit. Dr. Safar's group also developed the use of mouth-to-mouth breathing.[4]

Controversies of the Fifties

The hospital became the target of a number of controversies and criticisms. A committee of the medical society conducted an investigation to find out whether physicians were practicing corporate medicine. This investigation was symptomatic of a widespread resistance on the part of practicing physicians to the practice of medicine by physicians on a salary. This method of practice was believed to destroy the valued patient-physician relationship, to demean the physician, and to undermine the private practice of medicine. Many thought it would lead to government control of medical care. The major objection, however, was that patients able to pay private or third party fees were being treated at a public hospital.

A second controversy arose over the relations between the Baltimore City Hospitals and the medical schools. The result was that the medical schools were given priority for *student teaching* on different services at the Baltimore City Hospitals but were given an equal responsibility in selection of chiefs of service.

A more recent controversy (1966) has been that brought about by a committee appointed by the City Comptroller to look into complaints by patients, their families, and nurses as to the operations of the Baltimore City Hospitals. This investigation was carried out by a citizen's committee which interviewed patients, nurses, and other hospital personnel but did not talk to any physicians. The major criticisms were aimed at the medical, nursing, maintenance, and housekeeping practices in the D Building (the large chronic hospital) and the fact that ambulatory patients with tuberculosis occasionally (and against hospital rules) went to nearby taverns, thus exposing the general population to tuberculosis.

The hospital administration and physicians had long been deeply concerned with the problems of staffing and renovating the D Building, but repeated requests for money to carry out improved programs had not been appropriated by the City Council. Baltimore City was in serious financial difficulty, and there was a nationwide shortage of nurses.

	1966	Dr. Lawrence E. Shulman

The problem of control of patients with infectious tuberculosis went much farther than patients wandering down to Eastern Avenue. Although Baltimore has for many years led the nation with its high tuberculosis rate, it was not until 1959 that the Health Department began to use the courts to commit patients with open tuberculosis (who refused hospitalization or treatment) to a tuberculosis sanatorium.

A third criticism that patients with open tuberculosis had been knowingly mixed with general non-tuberculosis patients without isolation could not be substantiated by the hospital staff.

Although generally censorious of the Baltimore City Hospitals' efforts to provide excellent medical care to the chronically ill, the report must have made clear to the committee and to municipal authorities that to accomplish its purpose, the hospital will require huge appropriations over the next few years to bring its buildings into repair, to raise salaries, to create new positions and generally to improve the amenities of the hospital. The patients who come to the hospital under the Medicare program will no longer be welfare clients but will be private patients demanding not only good acute medical and nursing care but also the pleasant surroundings, privacy, and personal attention offered by the smaller, newer community hospitals.

The hospital underwent a number of other investigations during 1966. An official team of the American Hospital Association reported, "The citizens of Baltimore should be proud of the fact that not only are (Baltimore City Hospitals) furnishing top quality medical care for their indigent but also are doing more than their share in training doctors to meet their community's and the country's needs for qualified medical practitioners." This committee agreed that there were too few nurses and that the attitudes of supervisory personnel needed improvement.

In June, 1966, the Joint Committee of Accreditation of Hospitals approved the hospital for the maximum (three years) period, and the Maryland State Department of Health approved the Baltimore City Hospitals for Medicare.

I believe that responsible investigations of the hospitals not only are appropriate in a public institution but over the years have served a useful purpose. "No institution," writes Titmuss, "continually in a state of change, constantly subject to the pressure of many vested interests and forces, can hope to remain healthy without criticism. . . ."[5] Investigations of the Baltimore City Hospitals have never uncovered any serious problem which was unknown to the hospital authorities and which efforts had not been made to correct. Investigations have frequently mustered public opinion to support the hospitals' needs where requests through standard channels have been ineffective. For, although the hospitals have generally been consistently supported by the medical schools, the elected city officials, the medical society, and the hospital (or welfare) board, Baltimore residents have sustained little or no pride in the Baltimore City Hospitals. This lack of interest in the Baltimore City Hospitals is partially explained by the fact that it was first an almshouse, then an insane asylum, and more recently a hospital for welfare clients. The publicity for the hospital has been very poor. The Baltimore City Hospitals is in the news only when some deficiency is discovered. Possibly the use of the hospitals by patients on Medicare will result in more public attention and improvements.

Medical Teaching

This controversy was in part a manifestation of the needs of the medical schools for patient material for their students and for more teachers. The welfare patients at the Baltimore City Hospitals needed the services of medical students and did not object to being examined by them. The growth of coverage by Blue Cross and Blue Shield placed many of the ward ("free") patients in the university hospitals in the category of semiprivate patients. These patients were considered less desirable teaching material.

Furthermore, the full-time physicians at the Baltimore City Hospitals were willing and eager to teach students. Since their salaries were paid by the City of Baltimore, they swelled the ranks of potential teachers without cost to the medical schools.

Medical students were making an increasing contribution to the care of patients at the Baltimore City Hospitals. In 1953, the Johns Hopkins third year medical students had become fulltime clinical clerks on the medical wards. Students also participated in the activities of the Pediatric, Surgical, Anesthesia, Obstetrics and Gynecological Departments. In 1963, the University of Maryland medical students who previously had worked in the Outpatient Department and as parttime clinical clerks were given a three-week period on the medical wards as fulltime clinical clerks.

An observer from England studying medical education mainly at the Johns Hopkins Medical School compared the instruction of the United States schools with that of the British schools. He noted the heavy emphasis on student research in the American schools but thought that the instruction in the history taking and physical examination was not emphasized sufficiently. The case history was described as going into amazing detail, but the author thought that the student was often submerged in a sea of confusing data. The individual instruction of students, oriented around the patient at the bedside, was considered a superior method of teaching. He noted that the American student sees fewer patients than the English student but studies them in more depth. He thought that the use of welfare patients as material for student teaching led to little understanding of the social aspects of the patient's illness. One of the greatest compliments he paid the American system was the lack of formality and the questioning of authority and dogma by the American medical student.[6]

Under the direction of Drs. Mirick, Chinard, Harrison, and Neustadt, a family practice (two-year) internship was introduced at the Baltimore City Hospitals in 1960.[7]

This was the first such program in the United States. It was designed to give the physician experience with patients from birth to old age. Psychiatry was emphasized in addition to internal medicine and pediatrics. The program was supported in its early years by the Kellogg Foundation. The program served a useful purpose and has been continued.

Rehabilitation and Community Medicine

Late in 1954, the last physical therapist resigned. After a study of the needs for physical therapy, a

MOLECULAR REMODELING—

laboratory exercise or clinical necessity?

More than twenty-five years have passed since the discovery of the diuretic activity of sulfanilamide started pharmacologists on a succession of molecular remodelings to find the ideal diuretic.

Diuresis—a sought-after clinical effect from an unwanted side effect

It started in 1937 when a clinician reported that the administration of a sulfonamide was sometimes accompanied by an unexplainable side effect—metabolic acidosis.[1] Three years later the side effect was explained. The sulfonamide radical of sulfanilamide inhibited carbonic anhydrase,[2] the enzyme responsible for converting carbon dioxide and water to hydrogen ions and bicarbonate ions.

Later, other investigators showed by dog experiments that metabolic acidosis probably resulted when the inhibition of carbonic anhydrase upset the exchange of hydrogen and sodium ions, causing increased excretion of sodium as the bicarbonate.[3]

It was twelve long years after the first report of the unexplainable side effect (metabolic acidosis) that it was finally shown that large doses of sulfanilamide administered to edematous patients were indeed capable of promoting diuresis.[4] However, the possibility of toxic effects from its prolonged use and its relatively weak diuretic action made it impractical for clinical use as a diuretic.[5]

Because the inhibition of carbonic anhydrase seemed to be the key to effective diuresis, investigators began to look for more potent enzyme inhibitors —in the hopes that they would be more effective diuretics.

The most important of these early compounds, acetazolamide, enjoyed several years of fairly wide clinical use.

Its carbonic anhydrase inhibitory activity was several hundred times greater than that of sulfanilamide.[6] The increase in inhibitory activity, however, increased not only the excretion of sodium and bicarbonate ions, but also the excretion of potassium.[7] And, like its predecessor, acetazolamide precipitated mild acidosis. Its prolonged use could result in hypokalemic acidosis.[7]

The 'thiazides'—an answer to the metabolic acidosis caused by carbonic anhydrase inhibition

Despite the fact that the sulfonamide group appeared to be responsible for carbonic anhydrase inhibition which in turn appeared to be responsible for diuresis, investigators began to synthesize compounds with structural alterations to the sulfonamide group.

The first major breakthrough came with the synthesis of chlorothiazide. Altering the sulfonamide group did indeed alter the ability of chlorothiazide to inhibit carbonic anhydrase—it was only 1/10th as potent as acetazolamide in inhibiting the enzyme.[8] Despite the drop in inhibitory potency, however, chlorothiazide proved to be an effective diuretic—an observation that led to the conclusion that its diuretic action was due to some mechanism other than its action on carbonic anhydrase.[9, 10]

For effective diuresis, chlorothiazide was administered in daily dosages ranging from 250 to 2000 mg.[11] It increased the excretion of sodium and chloride; and, to a lesser extent, potassium and bicarbonate.[11] The excretion of potassium appeared to be maximal at higher dose levels at which, theoretically, the carbonic anhydrase inhibitory effect is more active.[11] Its prolonged use, therefore, could sometimes result in metabolic hypokalemic, hypochloremic alkalosis.[7]

Naturetin—effective diuresis with more favorable electrolyte balance

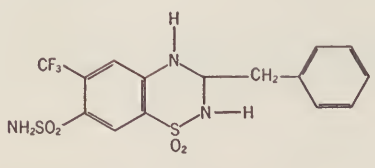
Other thiazides followed—with improvements being aimed at two particular areas: 1. attempts to increase diuretic action in relation to the milligram potency of the drug, and 2. attempts at a more favorable sodium/potassium ratio in the urine, i.e., to decrease the excretion of potassium while maintaining the excretion of sodium.[12]

One of these, Naturetin, Squibb Bendroflumethiazide, has made advances on both these points. "By adding a 3-benzyl radical to hydroflumethiazide a rather dramatic reduction in dose range is accomplished. With this drug, effective sodium excretion is obtained with doses between 2.5 and 10 mg., which a 200 to 1 ratio as compared to chlo thiazide..."[13]

Moreover, due probably to its virt lack of carbonic anhydrase inhibiti Naturetin (bendroflumethiazide) been shown to cause less potassium a bicarbonate loss and less alteration urinary pH than either chlorothiaz or hydrochlorothiazide.

Naturetin is outstandingly effect not only in establishing, but also maintaining, excretion of retained fl in edematous patients. And its durat of action is sufficiently prolonged allow a single daily administration most patients. Naturetin is also an effective antihypertensive agent.

Contraindications: Severe renal impairm previous hypersensitivity.



Warning: Ulcerative small bowel lesions ha occurred with potassium-containing thia preparations or with enteric-coated potass salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting G.I. bleeding occur.

Precautions: The dosage of ganglionic blo ing agents, veratrum, or hydralazine wh used concomitantly must be reduced by least 50% to avoid orthostatic hypotens Electrolyte disturbances are possible in rhotic or digitalized patients.

Side Effects: Bendroflumethiazide may ca increases in serum uric acid, unmask diabe increase glycemia and glycosuria in dia patients and may cause hypochloremic al losis, hypokalemia; cramps, pruritus, parest sias, and rashes may occur.

Supplied: Naturetin (Squibb Bendroflumeth zide) 5 mg. and 2.5 mg. tablets. Also avail Naturetin c K [Squibb Bendroflumethi de (5 or 2.5 mg.) with Potassium Chloride mg.)]. For full information, see Product Inf.

Naturetin®
SQUIBB BENDROFLUMETHIAZIDE
to reduce excess fluid
or high blood pressure

SQUIBB 'The Priceless Ingredient' of every product is the honor and integrity of its ma

recommendation was made to establish a Department of Physical Medicine and Rehabilitation at the Baltimore City Hospitals. This department was started in 1956. Its main purpose was to make certain that all patients of the Baltimore City Hospitals attained the highest degree of independence and returned, if possible, to home, family, and job.

The rehabilitation movement had opened the possibility for greatly improved medical care. Instead of paying patients off for injuries and impairments and thus ending society's responsibility, the rehabilitation movement emphasized the need to re-educate the patient and return him to the industrial stream.

Yet, rehabilitation did not answer the problems of patients without "rehabilitation potential." A number of social forces were creating a group of elderly, chronically sick persons who could no longer be cared for by their families and whose lives were prolonged because of improved medical diagnosis and treatment.

Families were living in smaller urban housing which did not allow room for the elderly members of the family. The working wife could no longer double as nurse.

An event of great importance to the Baltimore City Hospitals was the laying of the foundation of a long term program for the care of welfare patients with chronic diseases. The philosophy underlying this program was that the hospital is not a place merely to diagnose and usher the chronically ill, elderly patient into the next world, but the place in which prevention, diagnosis, treatment, and appropriate placement of patients with chronic diseases should be centered.

For nearly two centuries, the almshouse, then asylum, and finally hospital, had been concerned with the problems—medical, psychiatric, and social—of unwanted people—orphans, vagrants, the insane, the tuberculous. In this effort, the state had given relief and concerned attention. The new problem was the growing number of elderly destitute people with chronic diseases. The state had started three chronic disease hospitals for the care of patients with "rehabilitation potential," but this effort did little for the quantitatively more serious problem of those who did not have rehabilitation potential. For years, the Baltimore City Hospitals had given these patients shelter, nursing, and medical care, but most patients remained permanently in the institution and a large waiting list developed.

Dr. Mason Lord, who saw these problems at first hand as medical resident in 1958, started with vigor and imagination to meet them. No longer must the hospital and university stand aloof from community public health problems. His program was based on the following principles:

1. The care of these patients must be hospital-based, using all community resources possible. Cases must be discovered, diagnosed, and treated early to prevent deterioration.

2. Once accepted, patients must be observed permanently for coordination of social and medical problems and to insure that the benefits of early and expensive investigation and treatment not be lost.

3. These patients should be given the best possible diagnostic and social workup on acute medical wards. Since these patients make up a large part of the load of internal medicine, they should form an integral part of the training program of housestaff and medical students on medical wards of teaching hospitals.

4. The special services of the hospital—diagnostic, surgical, rehabilitative, and social—must be used to the hilt. That is, the patient, once having been evaluated and started on treatment, must be placed in facilities, ie, homes, foster homes, nursing homes, or apartments, when such facilities are available, but hospital beds must not be filled with nursing home patients.

5. This area of medical-social effort is as valid for intellectual endeavor and research as in any other academic field and must be informed by research and training of physicians, nurses, and social workers.

Dr. Lord was made chief of his newly founded Department of Chronic and Community Medicine in 1963. He established rapport with practicing physicians, with clinics, and with hospitals to find patients in need of this comprehensive preventive and treatment approach. All applications to the State Chronic Disease Hospitals and to the Baltimore City Hospitals were evaluated, and the decision was made as to where they would receive the most appropriate treatment.

A team was developed for evaluation of patients in the hospital and for follow-up in the

home, nursing home, or foster home. The old infirmary (D Building) was renovated to care for patients during convalescence while awaiting transfer to a nursing home. Plans were made for the development of an old age center, foster homes, and nursing homes.

Under the impact of this dynamic and creative program, a new dimension was added to the stature of the hospital.

In 1959, Mr. Parker J. McMillin retired from the Baltimore City Hospitals after many years of devoted service. He was succeeded by Mr. Frederic G. Hubbard. In the same year, Miss Mazie Rappaport was appointed director of social service and was able, over the years, to build up a distinguished Department of Social Service. Continued improvements were made in medical records and various administrative sections of the hospital as well as in the professional departments.

In 1963, an addition to the acute hospital was begun. This had been financed by a bond issue several years before. The addition was designed to contain sterile supply, records, pharmacy, clinical laboratories, new operating rooms, Department of Anesthesiology, premature baby unit, well baby unit, and obstetrical delivery suite. This unit was opened in July, 1965.

A plan was started to supply professional garden apartments for housestaff on the property of the Baltimore City Hospitals. This unit was opened in May, 1965.

A new $8,000,000 research building for the gerontological unit was started in 1966.

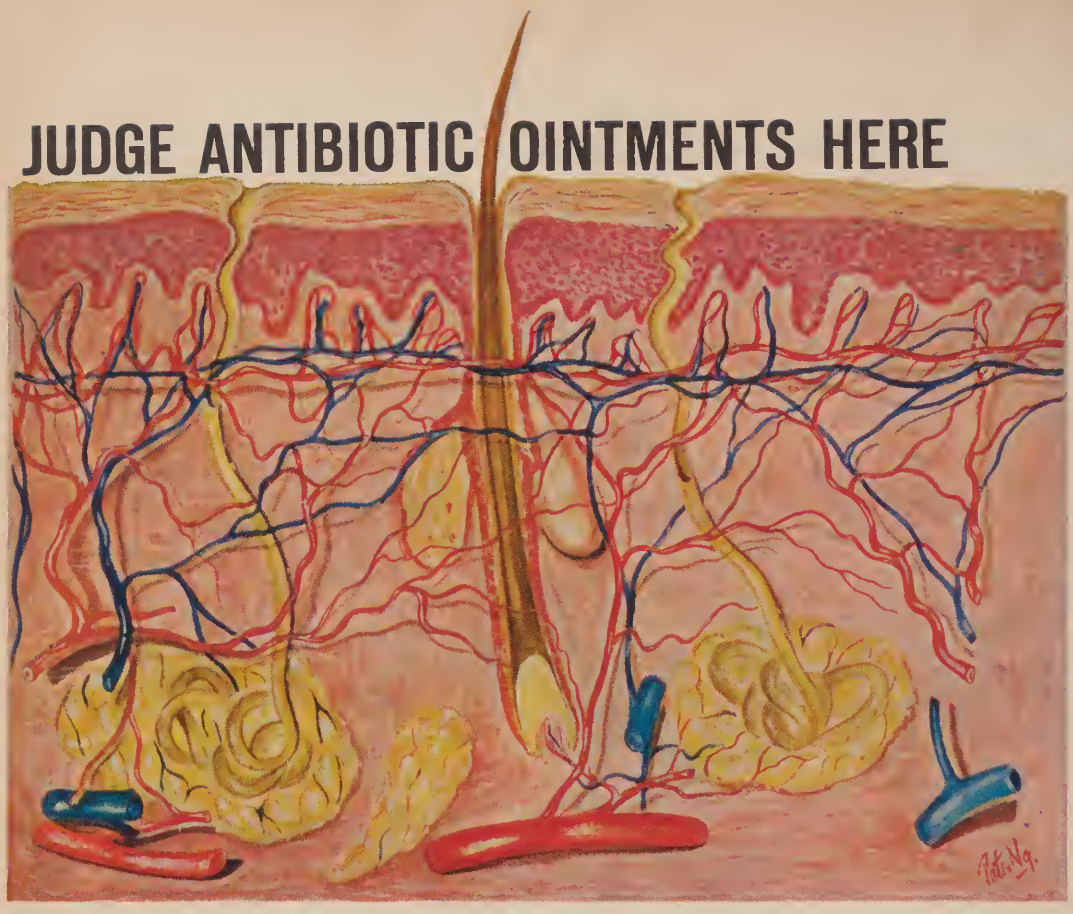
new

a new formulation that relieves pain in tension headache and neuralgia



Dialog is a combination of 15 mg allobarbital and 300 mg acetaminophen. Allobarbital, a proven barbiturate, provides desirable sedation in patients experiencing pain and discomfort. Acetaminophen is a nonsalicylate analgesic-antipyretic, well tolerated and useful in a wide range of mildly painful and febrile conditions.

Dialog is well tolerated, even by those sensitive to aspirin. It is nonirritating to the gastrointestinal tract and, in recommended dosage, has no adverse effects on the kidneys.

- Raises the pain threshold
- Suppresses the pain-producing mechanism
- Reduces emotional tension

JUDGE ANTIBIOTIC OINTMENTS HERE

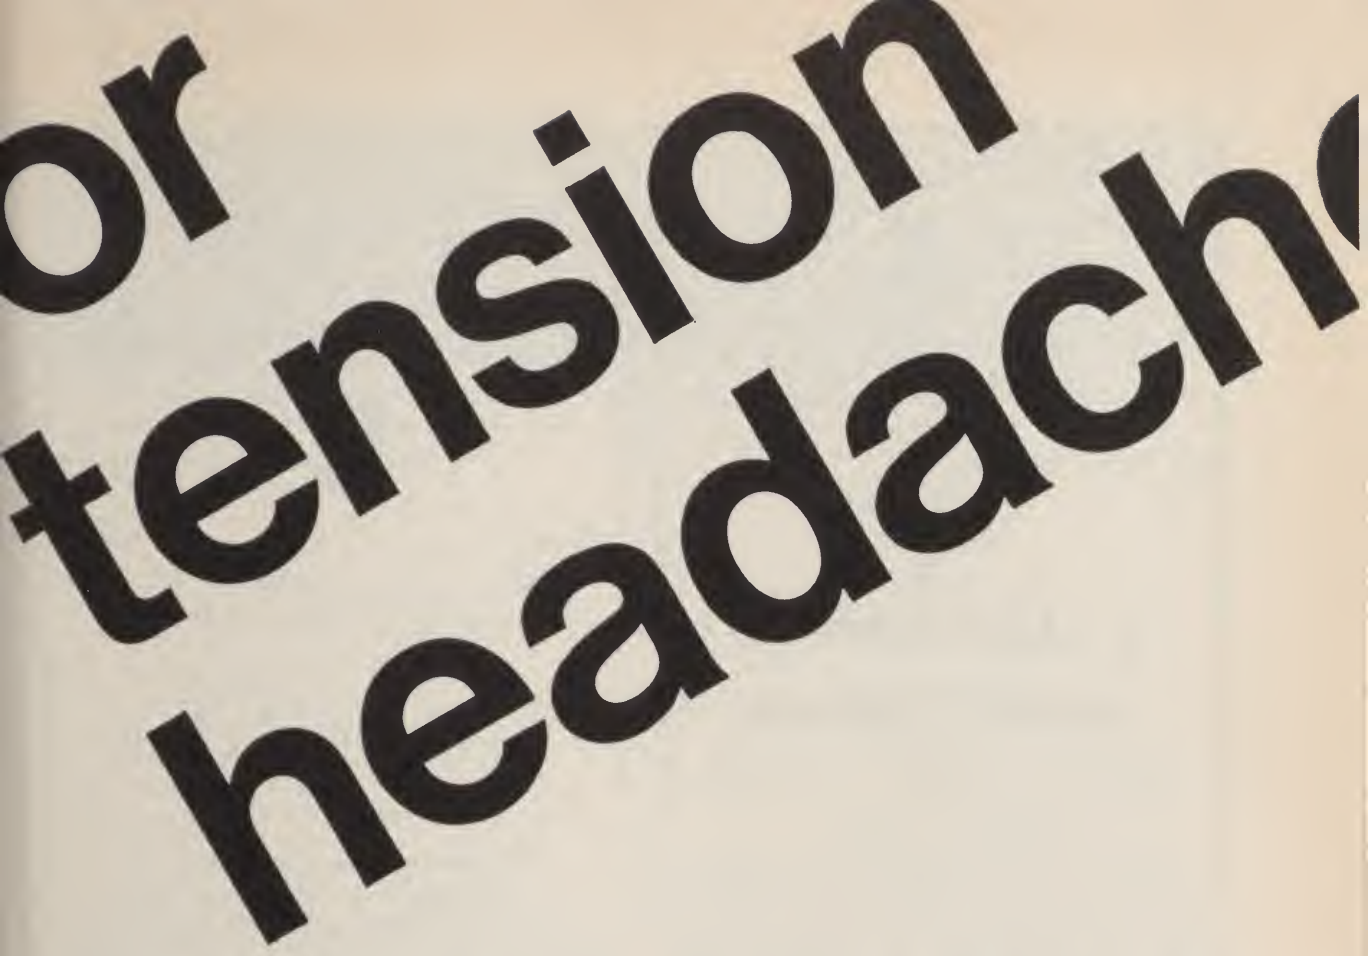
Results on skin are final proof of any topical antibiotic's effectiveness

No in vitro test can duplicate a clinical situation on living skin. 'Neosporin' (polymyxin B—bacitracin—neomycin) Antibiotic Ointment has consistently proven its effectiveness in thousands of cases of bacterial skin infection. The spectra of the three antibiotics overlap in such a way as to provide bactericidal action against most pathogenic bacteria likely to be found topically. Diffusion of the antibiotics from the special petrolatum base is rapid since they are insoluble in the petrolatum, but readily soluble in tissue fluids. The Ointment is bland and rarely sensitizes.

Caution: As with other antibiotic preparations, prolonged use may result in overgrowth of nonsusceptible organisms and/or fungi. Appropriate measures should be taken if this occurs.

Contraindications: This product is contraindicated in those individuals who have shown hypersensitivity to any of its components.

Supplied: Tubes of 1 oz., ½ oz. with applicator tip, and ⅛ oz. with ophthalmic tip.



Complete literature available on request from Professional Services Dept. PML.

'NEOSPORIN'®

brand

POLYMYXIN B-BACITRACIN-NEOMYCIN OINTMENT

Dialog™

(allobarbital and acetaminophen CIBA)

Indications: For relief of pain and discomfort of simple headache; neuralgia, myalgia, and musculoskeletal pain; dysmenorrhea; bursitis; sinusitis; fibrositis. Also indicated to reduce fever and to relieve discomfort due to respiratory infections, influenza, and other febrile conditions.

Contraindication: Not recommended during pregnancy.

Caution: May be habit-forming. Do not use in patients sensitive to barbiturates or in those with moderate to severe hepatic disease.

Side Effects: Nausea, transitory dizziness, rash. Overdosage of allobarbital produces symptoms typical of acute barbiturate excess.

Dosage: *Adults:* 1 or 2 tablets every 4 hours. Not to exceed 8 tablets in 24 hours. *Children 6 to 12:* ½ to 1 tablet every 4 hours. Not to exceed 4 tablets in 24 hours.

Supplied: *Tablets* (white, scored), each containing 15 mg allobarbital and 300 mg acetaminophen; units of 3 bottles of 30.

For your convenience—prescription-size bottle of 30.

ACCIDENTS IN CHILDREN: WHAT CAN WE DO ABOUT THEM?

THOMAS E. REICHELDERFER, MD
Chairman of the Committee on Accident Prevention and Poison Control Centers, Maryland Chapter American Academy of Pediatrics

While the rate of accidental deaths in children decreased 30%[1] in the decade 1953-63, accidents exceed diseases as the cause of death of the nation's youth. Much of this reduction has been due to the continuing efforts of physicians, safety programs, pharmacists, public health departments, national safety councils and associated groups, and other interested agencies; but there is still a continuing problem to be met in bringing about a further reduction in unnecessary deaths, crippling, and injury to our youth.

Accidents are the main cause of death in all age groups up to age 44.[2] Motor vehicle accidents account for most of the accidental deaths in the older age groups.

Most accidents in children 1-4 years old are the result of pulling objects off tables or stoves, being left alone in homes without responsible adult supervision, and playing with matches. Approximately 21% of about 5,100 deaths in 1962 were from fires and explosions. Second and third causes of death in this age group, about 14% each, included drowning and motor vehicle accidents to pedestrians. Children in this age group escape supervision and run into the path of oncoming cars or fall into bays, rivers, lakes, or swimming pools. Poisoning and falls killed approximately 500 more children. The risk of accidental death is greater for boys than for girls, and greater for non-white than white children.

Three-fifths of approximately 14,600 deaths from accidents in teenagers and young adults (15-21 years) involved motor vehicles. Another 1,200 were drowned, and 600 were killed by firearms.

Physicians can, upon entry into homes, suggest prevention of hazardous situations when they exist. They can advise mothers that the discipline of obedience in the child is an important safety tool and that the small child must be protected until he is old enough to care for himself. Parental responsibility must also be stressed. Baby sitters should be able to contact parents and should have available the police, fire, and physician's telephone number in case of emergency.

Prescribing only sufficient medication to treat an illness and insisting on proper labeling and disposal of the medication after it is no longer needed are part of the physician's responsibility. Medicines, especially aspirin, and home cleaning agents are the leading causes of accidental poisoning. Medications should be locked up and

cleaning agents kept out of reach of children. Pamphlets and other material relating to the prevention of accidental poisoning and other hazards could be placed in the waiting room for patients' reading.

Three children died of accidental poisoning in Maryland last year. The Poisons Information Centers in the state assisted 3,161 people with problems of poisoning. A Maryland Poison Information Center with a full-time staff has been established at the Baltimore City Hospitals. This center operates 24 hours a day, seven days a week, and gives instructions for emergency first aid and accidental poisonings. The establishment of this center is the result of cooperation between the Maryland State Health Department, the Thomas Wilson Foundation, and the Maryland Chapter of the American Academy of Pediatrics. It can be reached by calling DIckens 2-0800.

Physician's should take a greater interest in automobile design and safety and should insist that local and state traffic laws be enforced. They can also support driver education and safety programs. Young people should be encouraged to learn to swim. The American Red Cross and the Young Men's Christian Association teach many children to swim each year. When the physician sees firearms in the home, a word of warning to the parent often will prevent a catastrophe.

By supporting programs outlined above, physicians have been responsible for much of the reduction in accidental death in children. The program is one on continual parental education and vigilance. Please continue with your efforts.

SYMPOSIUM ON ADOLESCENCE

NEW ORLEANS, LOUISIANA **DECEMBER 1-3, 1966**

Approved for 15 hours credit by the American Academy of General Practice
Sponsored by the
DIVISION OF PSYCHIATRY and
COMMUNITY MENTAL HEALTH CENTER OF TOURO INFIRMARY
supported by a National Institute of Mental Health Grant

GUEST LECTURERS INCLUDE:

Dana Farnsworth, M.D., Director of Student Health Services at Harvard University, Cambridge, Mass.
Irvin Kraft, M.D., Professor of Child Psychiatry at Baylor Medical School, Houston, Tex.
John Schimel, M.D., Associate Director of William Alanson White Institute of Psychiatry, Psychoanalysis and Psychology, New York, N. Y.
George Tarjan, M.D., Professor of Psychiatry and Program Director of Mental Retardation Project at University of California in Los Angeles, Calif.
Carroll Witten, M.D., President-Elect of American Academy of General Practice, Louisville, Ky.

AMONG TOPICS TO BE DISCUSSED:

"The Physician's Role in Mental Retardation"
"Parents of Problem Children"
"Handling of Adolescents by General Practitioners"
"Sexual Morality—A College Dilemma"
"Drugs in the Treatment of Children and Adolescents"
"Learning Problems of the Adolescent"
"Adolescence and Social Mores"
"Talking About Sex with Adolescents"
"Religious-Psychological Conflicts"

Symposium will be held at the Fontainebleau Motor Hotel, 4040 Tulane Ave. Early hotel reservations are recommended.

Home Rehabilitation of the Stroke Patient

JOHN E. GESSNER, MD

Assistant Professor, Division of Physical Medicine and Rehabilitation
University of Maryland School of Medicine.

Rehabilitation, like any other therapeutic technique, may be an extremely complicated procedure. But just like appendectomy, it usually is not, and when applied appropriately, it is effective.

When used in treating the disabilities associated with stroke and similar syndromes, it is most effective when applied as an effort to teach patients to perform activities of daily living and ambulation. For the patient with moderately severe hemiparesis—and minimal or no impairment of intellect or memory, the most effective techniques are those partly developed and currently practiced in the chronic disease hospitals of the Maryland State Health Department. This program makes little or no use of complicated and controversial exercise programs designed to "stimulate" new neuronal pathways for the return of function.

A common sense approach is used, that is, teaching patients to use their remaining function to feed, dress, and bathe themselves and to get around in a wheelchair, or more usually to ambulate safely with whatever bracing and appliances are necessary. A patient with no function in an upper extremity and only poor hip flexion and knee extension, with moderate spasticity, usually requires a short leg brace and cane. When possible, hemiparetic upper extremities are trained as helping hands, but in the moderately severely involved patient described above, function rarely returns in the upper extremity.

My experience with the use of speech therapy in the treatment of aphasia has been that, if spontaneous return of speech does not occur, the therapy is of psychological value, at best. This is particularly true in those patients with severe involvement characterized by loss of auditory recognition. Some speech pathologists maintain that the best speech therapy for the patient with stroke is in his home environment with relatives and friends as therapists.

Senile patients with symptoms of extensive cerebral arteriosclerosis, including poor memory, short attention span, and lack of judgment, obviously do not do well in a program in which the

patient's contribution to success consists of learning and doing. However, cerebrovascular stroke is a dynamic syndrome with a great tendency for recovery, and patients who have early confusion, incontinence of bowel and bladder, or poor body balance often improve and on this account should not be denied a trial of therapy.

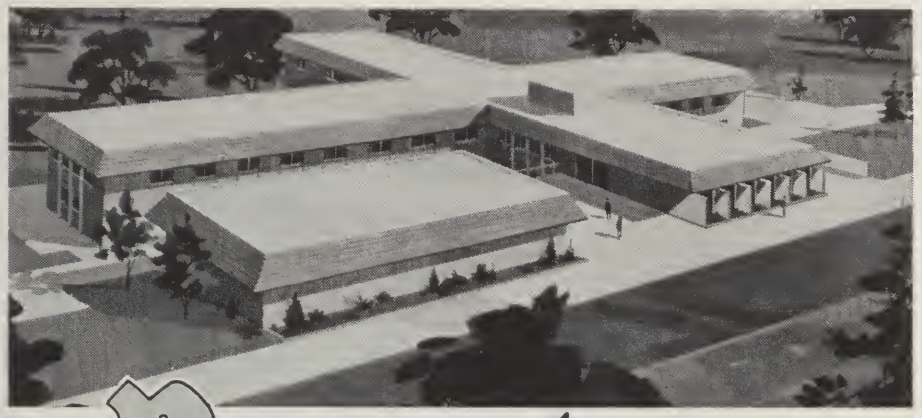
As part of a project by the Harford County Heart Association to develop a home program of therapy for patients with residual disability from stroke, a registered nurse from the county spent three months at Montebello State Hospital learning chronic disease nursing care on the wards, self-care and ambulation techniques in the physical therapy department, and teaching of the techniques to the patient under supervision. She was taught to use the Barthel index[1] in evaluating patients' abilities. The program was then publicized to the physicians of Harford County, who were responsible for formal referral for therapy. As consultant in physical medicine and rehabilitation to the program, I saw the patients and sent to each one's physician a written report of findings and prognosis, including prescription plan. Whenever possible, the physician was invited to attend the evaluation. In addition, the therapist was required to report to the physician concerining the patient's progress.

Of the first 20 patients seen, 11 became independent in activities of daily living and ambulation. Nine of these 20 were younger than 65 and of this group, seven became independent and two died. Eleven were older than 65, and only four became independent. Six of this group died. Thus. 55% of the patients in the series became completely independent in activities of daily living and ambulation using criteria of the Barthel index. The average treatment time for this group was one and a half months. Early in treatment, therapy was carried out daily. This average time would seem to approximate an adequate trial. In this group, youth (65 or under) was the best prognostic sign. Only two patients were aphasic, and these were among the patients who died.

The death rate of 40% one and a half years later is not excessive,[2] since some of the patients were seen within days after the onset of stroke. Exercise was graded, and patient tolerance was gauged on the basis of respiratory rate and pulse. No referred patient was refused treatment. The fact that patients with permanent brain damage with intellectual deterioration do not become independent was borne out in this study.

An almost universal problem was getting the patient out of his hospital bed, where he was immobile, into a standard height bed with a firm mattress (or bed board), so that transfer activities could be started. Once the family realized the ease with which the hemiparetic patient could be moved from bed to a wheelchair and then to a commode, they became enthusiastically active in the program.

No special equipment was used, and the therapist's ingenuity substituting bed rails for parallel bars and using ramps in the home made it unnecessary. A wheelchair was available early in the program, and was removed when the patient became ambulatory. Homemaking training was done in the patient's own kitchen. Foot drop braces were manufactured for the patients in Baltimore. Patient funds were always used when available.



Conclusions

Rehabilitation at home is possible for patients disabled from stroke and, for the average family, it is desirable.[3] The patient does not leave the family circle, nor does he become a disposition problem for the chronic disease hospital. Rehabilitation can be done with a minimum of equipment. It consists essentially of showing patients how to use remaining functional abilities, of which they often are unaware.

The rehabilitation team should comprise the family physician and a therapist who concentrates on teaching activities of daily living. The rehabilitation facilities of the chronic disease hospitals may be used for those patients who do not improve after adequate trial or for consultation during treatment at home.

These same techniques could be used for patients with orthopedic problems of hip fracture, for example, and for patients with incapacitating rheumatoid arthritis. Further controlled study should be done on larger groups, and the effects of socioeconomic status on results should be studied, since this study was done on a small homogeneous middle class group.*

Summary

Twenty patients who had sustained cerebrovascular stroke were given training in activities of daily living and ambulation in their own homes, as part of a home rehabilitation program. Ages ranged from 45 to 93. Eleven, or 55% of the group, became independent in activities of daily living and ambulation. Eight patients had died by one and a half years later, two of whom had become independent. Three patients were transferred to nursing homes.

THE MEASLES VACCINE IN PREVENTION OF MENTAL RETARDATION

Ten-year-old Kimela Jean (Kim) Fisher is this year's poster child. Kim, daughter of Mr. and Mrs. Guy William Fisher, of Fort Wayne, Ind., was a bright child until she was two, when she developed measles encephalitis. The inflammation of the brain caused mental retardation and defects in vision and hearing.

Measles is the most serious of the childhood infectious diseases. Four million children get measles every year. Some 500 children die of it; of the 4,000 who develop measles encephalitis, 1,600 become mentally retarded. One in six develop serious respiratory illnesses, including pneumonia, which is responsible for most of the infant deaths from measles. More than half of the four million children who have measles suffer some form of brain involvement, as indicated by abnormal electroencephalographs taken during the course of the disease. Though the EEG's go back to normal when the children have recovered from the measles, researchers still do not know what changes may have taken place in the meantime.

Three years ago, measles vaccines were licensed by the United States Food and Drug Administration. Thus there are now safe and effective means to eradicate this cause of mental retardation and other handicaps.

This year, therefore, the National Association for Retarded Children (NARC) is urging its member units to cooperate with physicians and health agencies in reaching the more than 12,000,000 children of susceptible age (nine months to 12 years) who have not yet been vaccinated.

NARC units can be helpful in promoting measles vaccination through their public information and other programs. A fact sheet, "What You Should Know About Measles and the Measles Vaccines," has been prepared by NARC. The fact sheet includes a list of 87 immunization projects in state and local health departments which have been supplied with measles vaccine by the United States Public Health Service. There is no charge for the vaccine, but in some areas parents may be required to pay a small fee.

The NARC Public Health Services Committee set forth as one of its objectives for 1966 to urge the inclusion of measles vaccination in each child's immunization program.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

THE ALCOHOLIC TREATMENT PROGRAM AT CROWNSVILLE STATE HOSPITAL

GERTRUDE L. NILSSON, ACSW
Coordinator, Services to Alcoholics
Maryland State Department of Mental Hygiene

In most states, professional services to alcoholics were initiated in response to one pioneer voice crying out in the wilderness of ignorance about alcoholism and neglect of alcoholics. In Maryland, that voice some 15 to 20 years ago was the voice of an analytically trained and oriented psychiatrist, Dr. Isadore Tuerk, now Commissioner of Mental Hygiene. When Dr. Tuerk was Superintendent of Spring Grove State Hospital, he organized a separate unit for alcoholics. That was 17 years ago, and Mrs. Marty Mann has said that it was the first of its kind in the country. Dr. Tuerk himself gives full credit for the development to a group of Alcoholics Anonymous members who suggested it to him to make their Twelfth Step job in the hospital easier and more effective.

For the past five years, Maryland has had four such special units, one in each of its regional mental hospitals. The Crownsville Unit is the biggest and most comprehensive of the four, and so far, the only one with beds for women alcoholics. Crownsville is a 2,000 bed State psychiatric hospital, serving four southern Maryland counties and one-third of Baltimore City, the third in which Skid Row is located.

The Alcoholic Rehabilitation Unit is located in two two-story red brick cottages with open doors, quite separate from the rest of the hospital. The second floor of one cottage has been partitioned to provide a 22-bed dormitory for women. The remaining 108 beds, including the Sick Bay for the acutely intoxicated, are for men. (Newly admitted women alcoholics needing emergency medical care are detoxified in the Medical and Surgical Unit.) The cottages are relatively comfortable, and have sufficient space for the program carried on in them. The alcoholics themselves keep their quarters clean, painted and in good repair; and provide a number of "luxuries" not included in the regular hospital budget, such as coffee makers and an unlimited supply of coffee, AA posters and pamphlets, radios and televisions, recreational equipment, etc. Men and women participate jointly in all activities.

The physical plant is perhaps the least important feature of an inpatient alcoholic program. The essential features might be listed as follows:

1. Selected staff with a variety of skills,

Delivered at the University of Colorado School of Alcohol Studies, June 21, 1966.

2. An open-door admission policy,

3. Individualized evaluation and treatment of patients,

4. A broad variety of treatment, involving the individual patient's own resources—his own strengths, skills, family, etc.,

5. Pre-release planning with community collaboration,

6. Realistic goals, and,

7. Attention to public education, professional training, and research.

In the Crownsville program each of the seven features contributes to the quality of the counseling service.

Most of the staff are self-selected—they have *chosen* to work with alcoholics. Some who had not originally chosen their assignments to the Unit, have, after exposure to the program, become its most devoted exponents. Their feeling for alcoholics leads them to welcome the partnership of AA members and of the patients themselves. The program process, as described below, is designed to develop a kind of harmony of point of view, a homogenized philosophy, among staff members and to keep communications open among them.

A wide variety of skills are represented on the staff. The administrator-coordinator is a psychiatric aide, a member of AA. Two other AA members are psychiatric aides, and the psychiatric aide assigned to assist the administrator is a member of Al-Anon. The nursing supervisor is a licensed practical nurse. There is a full-time medical director, an internist; a full-time psychiatrist, a resident who spends three months of his residency in the Unit; two full-time trained social workers; and the services as needed of an industrial therapist, a vocational counselor, a chaplain, psychologists and, of course, the various medical specialists who serve the whole hospital population.

The Superintendent of Crownsville, Dr. George McK. Phillips, sees his hospital as offering a community service, and to serve the needs of alcoholics, who have never been known to adjust their drinking practices to professional office hours, the hospital has an open-door policy. Alcoholics (who account for about 50% of all admissions) are admitted any time of the day or night, whether drunk or sober, whether male or female, whether on voluntary request, on two doctors' certificates, or by court order, whether they are first admissions, or are coming in for the 10th or 12th or 20th time. At least one-half the alcoholics are admitted on voluntary request, but for most of them, the term "voluntary" is in quotation marks: somebody has pushed from the outside—usually a wife, or an employer, or a judge.

Individualized evaluation and treatment is assured for every alcoholic patient by a process of daily staffing of newly admitted patients. Because this process is the heart of the Crownsville program, some account of it is appropriate. Every morning at 9:00 AM, the staffing group meets. Present are the medical director, the psychiatrist, at least two representatives of nursing service, and a social worker. The industrial therapist is usually there, and the vocational counselor is there twice a week. The focus of the group is on the alcholic's here-and-now-reality, his present pain; except in very rare instances, little attention is devoted to family background or early childhood history.

The nursing supervisor, with the charts in front of her, reports on the admissions in the past 24 hours—usually five or six or seven. On a Monday morning there may be as many as 30.

One by one, each new admission who is well enough to do so, joins the group. He is introduced to the group and made to feel at ease. The medical director usually opens the interview, but everyone participates, raising the questions relevant to his function in the Unit. General questions asked include: What brought you to the hospital? What help do you want, or hope or expect to get here? How long do you plan to stay, and what plans do you have for leaving? If the patient has had previous admissions, the interview will be concerned with his experience since his most recent release: what had gone wrong with the plan with which he left, or perhaps, what had helped him stay sober for as long as he had.

There is worthwhile book material in the stories told at these sessions. The predominant feeling is fear. The alcoholics are frightened men and women. They are afraid to drink and afraid to stop drinking; they have been afraid to enter the hospital and are afraid to leave it; most of all, and universally, they are afraid of the future, because every one of them is aware of what has

been called "the exquisite predictability" of the alcoholic career: every one knows the fate that threatens him.

Before any patient leaves, the staff share a pretty good idea of his strengths and weaknesses, and have shared with him some treatment plan. For every patient the plan includes medical care, exposure to AA, attendance at educational meetings, involvement in Patient Self-Government, and a hand-tailored industrial assignment. For every patient it also includes assignment to one particular counselor (who may belong to any of the disciplines represented on the staff) to whom he may turn at any time he wants or needs individual help. For any one patient the plan may include any combination of a number of other services: family counseling by the social worker or the special counselor, help in settling unfinished business left behind on admission, psychological testing, social casework, group counseling, psychotherapy, pastoral counseling, vocational counseling (which may or may not lead to vocational rehabilitation), industrial assignments outside the hospital to earn money to finance release arrangements, trial home visits, and medication, including disulfiram (Antabuse). Occasionally, it can be arranged for a patient to use the Unit as a day-hospital or a night-hospital.

Discussion of each patient's length of stay is by no means academic. By law, the hospital may not detain an alcoholic patient for more than seven days after he has written the superintendent of his intention to leave; and by administrative policy, the same ruling applies to those who are admitted on two medical certificates. Those on court order have less freedom of choice, but the recommendation of the staff can, if it seems desirable, influence the Court's decision.

The average length of stay is four to six weeks, but the range is from three days to six months, or more. Most often, in perhaps 80% of the cases, the length of stay of any particular patient is a result of consensus between patient and staff. In the case of the alcoholic who has stayed sober for five years in AA before one slip brought him to the Unit, there is little point in keeping him longer than the three days he needs to detoxify and then sending him back to his family and his job, with the realistic hope that he will again stay sober for another considerable period of time. On the other hand, when it has been determined that a young alcoholic who is both bright and sensitive, is a functional illiterate, there is good reason to believe that adult education may help him find more satisfaction in a sober life, and learning to read and write takes several months. Among the alcoholic patients are those irreversibly damaged who will be in the hospital for life, but these patients are not housed in the Alcoholic Rehabilitation Unit.

Everyone who has worked with the staff at the Crownsville Unit, observed their work, or talked with their patients individually or in groups, is satisfied that enormous effort, compassion, ingenuity, imagination and pride go into this man-tailored (and woman-tailored) evaluation and treatment process. The staffing is a guarantee, repeated daily, that the Unit program is patient-centered, and that the staff work together toward goals jointly selected and accepted by them and the patients.

From experience with hundreds of alcoholics, the Crownsville staff have learned to be satisfied with partial goals. For one patient it may simply be keeping out of jail; for another, staying sober enough to hold a job; for a third living, perhaps on Welfare, on the dry island of a halfway house. Relapses come as no surprise. Indeed, if they are six months apart, they may prove a source of gratification, evidence of unexpected motivation in a patient who had not been sober for a week at a time for the past 20 years. Former patients who have become active in AA are encouraged to come back to the Unit to encourage those who have not yet found their way, and often serve as sponsors to patients on their way out.

Some time before the release date agreed upon at staffing, the patient's own counselor starts reaching out to the resources in his home community which may be able to help him stay well and to maintain whatever gains he has made in the hospital. The resources involved depend on both the patient and his community. Potential allies include a spouse, an employer, a welfare worker, a probation officer, a landlady, a public health nurse, an alcoholism or mental hygiene clinic, a clergyman, a half-way house, a family physician, an AA group, a private social agency, a council on alcoholism, or any combination of such resources. No patient leaves the Unit until it is determined that he has a place to live and some assurance of

an income.

Unfortunately, family counseling is only a minor feature of the inpatient program. In the first place, only about 20% of the alcoholic patients still have connections with their families; and in the second place, the geographic location of the hospital makes it difficult for some families to visit, and the hard-pressed staff have limited time to visit families. If the patient agrees, the staff may ask that an Al-Anon member visit his spouse. Such visits have helped in a few dramatic cases, but there are not yet enough Al-Anon members, and most of them are middle-class people who are not entirely comfortable with lower-class families and their problems.

Who counsels the alcoholic in Crownsville? Anybody and everybody on the Alcoholic Rehabilitation Unit staff, and more and more often it is happening that the alcoholic leaving the hospital keeps in touch with the particular counselor who has had some impact on him. Needless to say, patients also counsel other patients, especially those who work in the Sick Bay as orderlies and help the acutely intoxicated through their crises.

The final element listed above is professional training, public education, and research. These three activities are not just icing on the program cake, but are indeed more like vitamins that enrich it. Within the hospital, psychiatric residents and social workers are trained in the Unit. This past summer a group of psychology students have had supervised field experience there. The amount of public education done by staff in their routine contacts with those indispensable community agencies and agents is difficult to evaluate, as is also the educational value of the alcoholic who has been helped by the Unit to take a responsible role in his society. Members of the staff are always available to address church and civic groups and high school classes in their region, and participate generously in the Department's seminars for clergymen, social workers, nurses, and other professional groups. Research, a major part of the original Spring Grove program, is still in the planning stage, still only a dream for the future.

Is the Crownsville program perfect, or even the best of all possible programs for alcoholics? By no means, and members of the staff are quick to point out its weaknesses and needs. They feel most desperately the need for addition of a clerk-typist to their ranks to facilitate communications with the outside world which cannot be handled by telephone, for more in-service training for new and old staff, and for opportunity to follow-up their patients and to evaluate the effectiveness of their work.

There is really no end to the story of an in-patient program to which as many as 165 alcoholics are admitted monthly, about half of them for the first time, but some concluding statement must be made to this report:

Alcoholism is a chronic, progressive, life-long disease, and no time-limited in-patient treatment program, no matter how good, no matter how devotedly adminstered, can be expected to manage it. The hospital can help the alcoholic get sober, and can help him choose to stay sober. Indeed, a recent statistical study indicates that 60% of the alcoholics admitted to Maryland State hospitals are not readmitted within two years. Nevertheless, much of the effort and dedication of staff working with alcoholic in-patients for short periods of time is tragically wasted unless other community resources are ready and willing to provide continuity of interest and caring and service to every alcoholic out-patient who looks for their help.

this issue: the common cold and the aging patient

the common cold and the aging patient

Louis J. Vorhaus, II, M.D., F.A.C.P.

G. SCHWENK

Effects of aging on the anatomic and physiologic aspects of the respiratory apparatus.

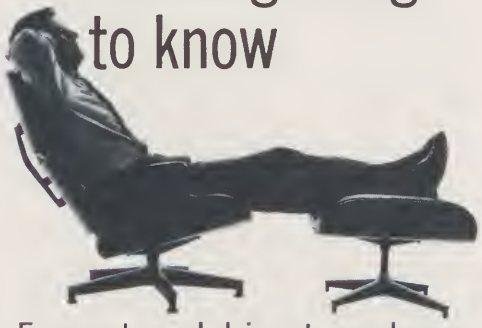
The chest becomes more fixed, less mobile and less elastic as the bronchial walls and thoracic ligaments lose elasticity The diaphragm and intercostal muscles atrophy and weaken. The lungs become smaller, flabbier and weigh less decreasing vital and total lung capacity, increasing residual volume and the alveolar dead space.

Sir William Osler described pneumonia as the welcome friend of the aged patient, because the patient with pneumonia usually died quietly. But today, the well-informed physician is an even better friend of the aging patient, since it is better to live than to die, no matter how quietly.

One of the first avenues of approach in the control of the hazards of respiratory disease in the aging patient is prompt and proper attention to the common cold or upper respiratory infection. The common cold may be the first step in the relatively short path to lower respiratory infection, broncho-pneumonia and death. This train of events occurs frequently among older persons. Indeed, pneumonia is one of the most common causes of their admission to hospitals and ranks high on the list of geriatric killers. Colds are more debilitating in elderly people and the aged are more likely candidates for secondary infections such as sinusitis and bronchitis. These infections, in turn, are more prone to lead to broncho-pneumonia, because of lowered resistance and anatomic and physiologic changes in the lungs of the elderly.

What is different about the respiratory tree of an aged person and that of an otherwise healthy younger adult? Aging certainly takes its toll on all parts of the body, affecting both anatomic and physiologic aspects of the respiratory apparatus. These changes are in part due to the wear and tear that occurs over the years; the repeated bouts of respiratory infection, long exposure to atmospheric pollutants, to occupational inhalants, smoking, malnutrition, obesity, inactivity and the development of other diseases which may affect the lungs.

With the passage of years, the lungs change. They become scarred and emphysematous and lose their compliance. The whole chest becomes more fixed, less mobile and less elastic.



The anatomic changes that occur in aging render the lungs less efficient. Tests of pulmonary function in senescence show a deterioration characterized by a decrease in vital capacity and total lung capacity, an increase in residual volume and alveolar dead space. Maximum breathing capacity is reduced and uniformity of ventilation deteriorates. These problems are often aggravated by the obstructed breathing, fever and secondary infection associated with the common cold, placing an additional stress on the entire cardiopulmonary reserve.

In addition, the efficiency of a cough is below par in older persons even though they are in good health. This is partly due to the decreased respiratory excursions and distensibility of the chest wall, and partly from loss of elasticity of bronchial walls which tend to make them collapse in a cough.

The elderly patient's resistance to infection is often reduced. Nutritional deficiencies are more common in aged people. There is some evidence to indicate that their capacity to respond to stress is less efficient. Finally, there is often relatively meager symptomatic response to acute disease. The absence of obvious or dramatic clinical signs and symptoms of severe illness is particularly dangerous because, coming as it

it's a
comforting thing
to know

For postnasal drip, clogged ears
and stuffed and runny noses

Triaminic® timed-release tablets

keeps patients comfortable 'round the clock. 24-hour decongestion on just a single tablet dosed morning, mid-afternoon and at bedtime. Patients regain senses and can breathe, smell and taste again.

Triaminic. Isn't that a comforting thing to know?

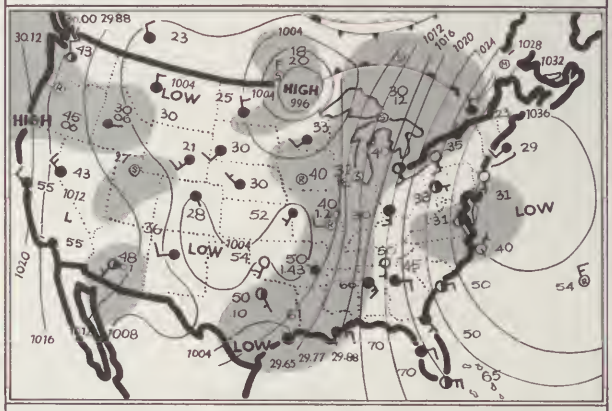
Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

(Advertisement)

does in a person whose defenses are weakened both locally and systemically, pulmonary disease may progress rapidly to irreversible stages before medical attention is sought. Respiratory infection is especially hazardous because the aged patient responds badly to hypoxia. Not only is his response to oxygen lack impaired, but the work of breathing, due to decreased compliance of the lung and increased stiffness of the thorax, is markedly augmented.
Many patients late in life are in a precarious and delicate cardiopulmonary balance which is easily decompensated from relatively minor insults such as colds and upper respiratory infections.



For all of these reasons, geriatricians long have stressed the importance of preventing respiratory insults. Today we have better ways of treating respiratory infection, improved techniques for clearing the lungs and bronchial tubes of secretions and better understanding of ways of improving ventilation. We possess a broader spectrum of antimicrobial agents including newer ones to deal with previously resistant organisms. Even so, the death rate from pneumonia is high in older people, and it is preferable to avoid the disease than to treat it. To do so, attention must be paid to the general maintenance of good health and all that implies, as well as to the prevention, elimination and treatment of associated conditions that predispose to or cause pneumonia such as chronic upper or lower respiratory infection, respiratory allergy, chronic sinusitis and exposure to inspired irritants.

Colds and other minor respiratory infections, which favor the development of broncho-pneumonia, should be treated vigorously and promptly, particularly those patients whose aging process has been accompanied by the development of chronic pulmonary disease. Upper respiratory passages should be cleared with decongestants. Sinuses should be drained adequately. And, when indicated, appropriate antimicrobial therapy should be instituted before serious infection of the lower respiratory tree supervenes.

In decades past it was understandable that physicians welcomed pneumonia for the aged patients because it offered them a quiet and peaceful demise. Today we recognize that in many cases, peaceful as it may have been, such deaths were often avoidable. With the current knowledge and understanding of the problems that respiratory infections impose on aging people, vigilant medical attention can often restore them to a vigorous, rewarding and productive life so that the many opportunities that exist today for people to enjoy their golden years are realized and not stolen by untimely death.

Weather Forecast Throughout the Nation

RAIN TURNING TO SNOW, INCREASING WINDS AND DROPPING TEMPERATURES FOLLOWED BY COUGH, CONGESTION AND PAIN

Tussagesic® provides up to 24-hour coverage of the tough cold with a single timed-release tablet dosed morning, midafternoon and at bedtime. Coughs are broken up, runny and stuffed noses are cleared and pain is relieved.

Each Tussagesic® timed-release tablet contains:

Triaminic®	50 mg.
(phenylpropanolamine hydrochloride 25 mg.; pheniramine maleate 12.5 mg.; pyrilamine maleate 12.5 mg.)	
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: Patient should not drive a car or operate dangerous machinery if drowsiness occurs. Except under professional care, do not give to patients under 12 yrs. or those who have persistent cough, high fever, heart or thyroid disease, hypertension or diabetes or use for more than 10 days.

(Advertisement)

when congestion is complicated by sulfa-susceptible bacterial invaders in the upper respiratory tract...

re-enforce your decongestant therapy

prescribe economical Trisulfaminic®

Each tablet contains: Triaminic® 25 mg. (phenylpropanolamine hydrochloride 12.5 mg., pheniramine maleate 6.25 mg., pyrilamine maleate 6.25 mg.); Trisulfapyrimidines, U.S.P. 0.5 Gm. (sulfadiazine 0.167 Gm., sulfamerazine 0.167 Gm., sulfamethazine 0.167 Gm.)

PHARMACOLOGY: Triaminic decongests and promotes drainage of nasal and paranasal passages, and prevents any further histamine-induced damage; the triple sulfonamides inhibit susceptible bacterial invaders. INDICATIONS: For congestion and infection of the upper respiratory tract caused by sulfa-susceptible organisms. DOSAGE: Adults: 2 to 4 tablets initially, followed by 2 tablets every 6 hours. Medication should be continued until patient has been afebrile for 3 days. ADVANTAGES: The advantages of Trisulfaminic in upper respiratory infections are: freedom from narcotics or alcohol; therapeutic reliability; safety; economy; ease of administration; freedom from potential sensitization to broad-spectrum antibiotics which may be reserved for lower respiratory or other infections caused by susceptible organisms. CONTRAINDICATIONS: Contraindicated in sulfonamide and antihistamine sensitivity, impaired renal function, pregnancy approaching term, and in premature infants and newborn infants during the first month of life. Do not use in patients with glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction. WARNING: Use only after careful evaluation in patients with liver or renal damage, urinary obstruction, or blood dyscrasias. Deaths have been reported from hypersensitivity reactions with administration of sulfonamides. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed periodically. Sulfonamide therapy may potentiate the hypoglycemic action of sulfonylureas. PRECAUTIONS: Use with caution in patients with histories of significant allergy or asthma. Assure an adequate fluid intake. Because the antihistamines may cause drowsiness of varying degree, warn patients about activities requiring alertness such as driving a car or operating dangerous machinery. Use with caution in the presence of hypertension, hyperthyroidism, cardiovascular disease and diabetes. ADVERSE REACTIONS: As in all sulfonamide therapy, the following reactions may occur: headache, nausea, vomiting, diarrhea, icterus, hepatitis, pancreatitis, urticaria, rash, fever, cyanosis, hematuria, crystalluria, proteinuria, blood dyscrasias, petechiae, purpura, neuropathy and injection of the conjunctiva and sclera. If one or more of these reactions occur, the drug should be discontinued. With antihistaminic therapy there have been reports of sedation varying from mild drowsiness to deep sleep, dizziness, lassitude, inability to concentrate, fatigue, incoordination, tinnitus, blurred vision, diplopia, euphoria, nervousness, insomnia, tremors, palpitation, hypotension, headache, chest tightness, urinary frequency, dysuria, tingling of the hands, dryness of the mouth, throat, and nose, gastrointestinal disturbances such as epigastric distress, anorexia, nausea, vomiting, constipation and diarrhea and very rarely, leukopenia and agranulocytosis. Adverse reactions reported with the use of sympathomimetic amines include anxiety, tension, restlessness, nervousness, tremor, weakness, insomnia, headache, palpitation, tachycardia, angina, elevation of blood pressure, sweating, mydriasis, anorexia, nausea, vomiting, dizziness, constipation, and dysuria due to vesicle sphincter spasm. PACKAGE INFORMATION: Trisulfaminic Tablets: Supplied in bottles of 100 tablets. CAUTION: Federal law prohibits dispensing without prescription.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

Highlights

LABORATORY TRAINING GRANT RECEIVED

The Bureau of Laboratories has received a grant of $2,748 from the U.S. Department of Health, Education, and Welfare to conduct a five-day training program in "Advanced Tissue Culture Technique."

The course is to be directed by the assistant chief of the Bureau of Laboratories. Twenty health department workers and teaching personnel from a five state area are being selected to be trained in the new technique.

The Advanced Tissue Culture Technique was developed by Dr. Leonard Hayflick of the Wistar Institute, Philadelphia, who will be one of the featured speakers on the program. This technique is used to isolate such viruses as polio, rubella and influenza from clinical material and employs normal tissue rather than the abnormal tissue formerly used under the old technique.

APPLICATION FOR STRIP MINES DEMONSTRATION GRANT

The Department submitted an application to the U.S. Public Health Service for a grant of $126,318 to demonstrate the feasibility of utilizing abandoned strip mines in Western Maryland for the disposal of sewage sludge and solid waste material. If the grant is approved, the Department intends to conduct, in cooperation with Allegany County, a landfill operation in an abandoned strip mine to determine if these depressions can be used as depositories for solid wastes, to attempt to develop a method of eliminating these eyesores from Maryland's landscape, to restore the land to its natural state from the standpoint of erosion as well as beauty, and to determine if the filling in of these sinks with refuse will significantly reduce acid pollutants to the Potomac and Youghiogheny Rivers.

SEMINAR FOR MEDICAL AND DENTAL STUDENTS

The Department's 14th annual public health work-training program included ten-week project assignments for sixteen medical, four dental, and three nutrition students. Thirteen of the medical students were from the University of Maryland, two from Johns Hopkins and one from Yale. Three of the dental students were from the University of Maryland and one from Georgetown University. The nutrition students were from the University of Maryland, St. Joseph's College, Emmitsburg, and the Colorado Women's College in Denver. A list of the project report and copies of some of the papers are available upon request.

OCCUPATIONAL HEALTH INVESTIGATIONS

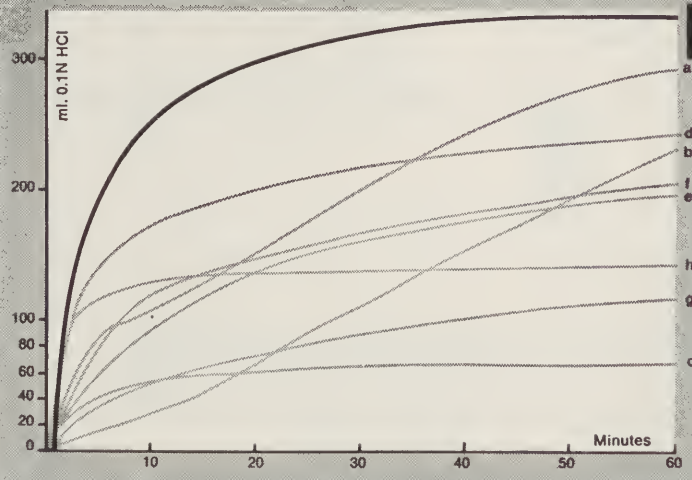
Due to a temperature inversion, a chlorine leak at a chemical plant caused respiratory distress among employees of a nearby plant in Cecil County. The lack of air movement caused by the inversion contained the chlorine gas in the narrow valley in which the neighboring plant is located. Because of either immediate or delayed reaction of employees to chlorine inhalation, the plant

Winthrop announces new WinGel®

ANTACID TABLETS AND LIQUID

For peptic ulcer, gastric hyperacidity, gastritis

Each WinGel tablet or teaspoon (5 ml.) contains 410 mg. of combined, highly reactive, short polymer, aluminum and magnesium hydroxides **stabilized with hexitol.**



Neutralizes 300 times its active-ingredient weight in gastric acid for fast, long-lasting relief

Gastric or duodenal ulcer, acute or chronic gastritis, gastric hyperacidity...wherever there is "acid overflow" new WinGel can provide faster, longer, more complete neutralization.

In recent laboratory comparisons* with eight other leading antacids, new WinGel tablets not only neutralized more hydrochloric acid per active-ingredient weight, but neutralized it faster and longer than all other antacids tested.

Pleasant pink in color, WinGel is delicately mint flavored with a smooth-as-cream texture—qualities sure to please the patient on long-term therapy. New WinGel is also specially formulated to avoid constipation or diarrhea.

New WinGel neutralizes 300 times its active-ingredient weight in 0.1N hydrochloric acid—neutralizes more acid faster than other leading antacids

Rate of 0.1N hydrochloric acid neutralization at pH 3.5 and 37° with WinGel and eight other leading antacid tablets—*in vitro*. Samples equaled the weight of tablet material containing 1.0 Gm. active ingredients.*

*Hinkel, E. T., Jr. (New York): Data in the files of the Department of Medical Research, Winthrop Laboratories.

Dosage: Peptic ulcer or gastritis—from 2 to 4 teaspoons of WinGel liquid or 2 to 4 tablets chewed or allowed to dissolve in the mouth every two to four hours. **Gastric hyperacidity**—2 tablets or teaspoons about ½ to one hour after meals as needed; children from 7 to 14 years of age, 1 or 2 tablets or 1 or 2 teaspoons of liquid as needed.

How Supplied: Liquid in bottles of 8 fl. oz. and 1 pint. **Tablets** in cellophane strips, boxes of 50 and 100. (One teaspoon of WinGel liquid is equivalent to one WinGel tablet in acid-combining capacity.) WinGel, trademark reg. U.S. Pat. Off.

was closed for two days. All those reporting any symptoms of exposure were sent to the medical center; 112 employees were examined; 4 required hospitalization; all are now reported to be in satisfactory condition. State and local health department personnel, in cooperation with the Department of Labor and Industry, worked together as a task force to prepare adequate engineering and medical recommendations to prevent the reoccurrence of such incidents. The Cecil County Health Department will conduct a continuing medical follow-up on those seriously affected.

At the request of the local health department, staff members investigated allegedly excessive exposures of employees to dust at an asphalt producing plant and at a ready-mix plant in Montgomery County. No excessive exposure was found.

An investigation of possible air contamination in a patient's home was made at the request of a private physician, without positive results. The Anne Arundel County Health Department is conducting a follow-up.

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:

ACHROMYCIN® Tetracycline HCl	125 mg
Phenacetin	120 mg
Caffeine	30 mg
Salicylamide	150 mg
Chlorothen Citrate	25 mg

The patient can feel better while getting better. ACHROCIDIN brings the treatment together in a single prescription—prompt symptomatic relief together with early, potent control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract.

Contraindication—History of hypersensitivity to tetracycline.

Warning—If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and if therapy is prolonged, tetracycline serum level determination may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment and treatment should be discontinued at first evidence of skin discomfort.

Precautions—Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect has been observed in usual short treatment courses.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.

Learn To Do Your Part In The Prevention Of Disease

New Comprehensive Health Services for Children and Youth

A plan to provide comprehensive health services, including dental care, for needy children and youth in economically deprived areas of Baltimore City was approved on May 16 by the Children's Bureau of the U.S. Department of Health, Education, and Welfare. Funded under the Social Security Amendments of 1965, PL 89-97, the new project, estimated to cost $2 million in the first year of a proposed five year period, will be administered by the Baltimore City Health Department.

An additional segment of the project, funded separately by the Children's Bureau in the amount of $1.2 million, will be under the direct purview of the Johns Hopkins Hospital, which will coordinate its part of the program with that of the Health Department.

Since the purpose of the grant is to increase the availability and improve the quality of health care services to children and youth, the program will be implemented by the establishment of Comprehensive Pediatric Care Centers administered in conjunction with existing Child Health Services. Each center will be staffed by new personnel employed by a local health center to conduct the program.

Identified as Project 606, this new Comprehensive Program for Children and Youth was designed by the City Health Department's Child Health Services under the direction of Dr. J. L. Rhyne. Hopefully, it will provide comprehensive and continuous care for approximately 40,000 needy children from infancy through secondary schooling, or age 18, and include medical, dental and psychiatric care. Baltimore City Hospitals, the Greater Baltimore Medical Center, the University of Maryland School of Medicine and Sinai Hospital have agreed to cooperate with the City Health Department in the development of the program. Project areas, and the number of children expected to be served in each, are as follows: Baltimore City Hospitals—5,000; Greater Baltimore Medical Center—2,000; Johns Hopkins Hospital—15,000; Sinai Hospital—5,000; and University Hospital—12,000.

Every effort will be made in the execution of this new program to cooperate with all private physicians and dentists in the areas served.

Dental Care

With tooth decay the most prevalent physical health problem of school age children, dentistry is an integral part of the service. Each center will contain appropriate dental facilities under the direction of a dentist with administrative and treatment responsibilities. His staff will include full and part-time clinicians, dental hygienists, and assistants according to need and clinic utilization. Close cooperation and consultations with non-dental members of the center staff to solve individual patient problems will be facilitated, as will access to special services and consultants anywhere in the community.

Administrative Staff

Administrative offices for the new project's staff members are located on the second floor of

The "Socio-geographic" mystery

Why is one man's gastric ulcer another man's duodenal?

Geographic variation in the *incidence* of peptic ulcer is a familiar fact. But the proclivity of certain *kinds* of ulcer for certain geographic areas is a recently recognized phenomenon.[1,2]

For example, in one particular Norwegian fishing village there is a tendency for patients to develop a gastric ulcer; anywhere else in Norway, ulcers are usually duodenal. Peruvians high in the Andes have more gastric ulcers than their compatriots in the lowlands. Why? Nobody knows.

Social variations, too. Even in the same geographic areas there are interesting variations. An Englishman's ulcer depends on his social standing—professional men suffer with duodenal ulcers, while workingmen have more of the gastric variety. In southern India the pattern is reversed. Here, duodenal ulcers are common among laborers and agricultural workers and rare among the upper classes.

Investigators are exploring every possible theoretical avenue in their search for the cause of peptic ulcer. Of all the factors implicated in ulcerogenesis, the one that is generally acknowledged to be of primary importance is hypersecretion of gastric acid.[3-8] Or, as one author states it: "The medical management of peptic ulcer pharmacologically is, in the final analysis, concerned largely with the effective inhibition of peptic activity."[3]

Robinul (glycopyrrolate) provides potent, rapid, specific antisecretory action confirmed by gastric analyses and x-ray evidence of clinical effectiveness.[3,7,9-12] It relieves pain with "impressive" promptness.[8] Quickly alleviates acute discomfort, and effectively counteracts gnawing pain, preprandial midepigastric pain, vomiting and other ulcer symptoms.[7] Suppression of nocturnal pain is "outstanding."[13] Maximally effective doses may be given with minimal side reactions, and the incidence of unwanted anticholinergic effects is negligible.[3,7-14]

No matter what the ulcer theory... the fact is that

Robinul®
(glycopyrrolate)

promotes the essential ulcer-healing environment

A. H. ROBINS

Robinul®
(glycopyrrolate)

promotes the essential ulcer-healing environment

Indications: In addition to its primary indications for duodenal and gastric ulcer, Robinul (glycopyrrolate) is indicated for other GI conditions that may benefit from anticholinergic therapy. Robinul-PH Forte (glycopyrrolate 2 mg. with phenobarbital) is indicated when these situations are complicated by mild anxiety and tension.
Contraindications: Glaucoma, urinary bladder neck obstruction, pyloric obstruction, stenosis with significant gastric retention, prostatic hypertrophy, duodenal obstruction, cardiospasm (megaesophagus), and achalasia of the esophagus, and in the case of Robinul-PH Forte, sensitivity to phenobarbital.
Precautions: Administer with caution in the presence of incipient glaucoma.
Adverse Reactions: Dryness of the mouth, blurred vision, urinary difficulties, and constipation are rarely troublesome and may generally be controlled by reduction of dosage. Other side effects associated with the use of anticholinergic drugs include tachycardia, palpitation, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, drowsiness, and rash.
Dosage: Dosage should be adjusted according to individual patient response. Average and maximum recommended dose is 1 tablet 3 times a day: in the a.m., early p.m., and at bedtime. *See product literature for full prescribing information.*
Supply: Robinul (glycopyrrolate 1 mg.); Robinul Forte (glycopyrrolate 2 mg.); Robinul-PH (glycopyrrolate 1 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming); Robinul-PH Forte (glycopyrrolate 2 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming.) In bottles of 100 and 500 scored tablets.

The Alcoholic Patient

Last year, for the fifth consecutive year, more patients were admitted to Maryland's psychiatric hospitals for the treatment of alcoholism than for any other single diagnosis. More than two out of every five male admissions and one out of every eight female admissions were reported to be alcoholics. In addition, in excess of 10% of patients with other diagnoses were also reported to have a major drinking problem. Thus, alcoholism was related to the patient's illness in half of all admissions.

Alcoholism has been recognized as a serious community problem since the earliest days of recorded history. However, knowledge that alcoholism is a disease requiring both immediate and extended treatment is of recent origin. Court decisions during the past year have enforced this concept and will undoubtedly have a major impact on psychiatric treatment facilities. It continues to be one of the most important public health problems, both in the United States and in many other countries. While the total number of alcoholics is not known, it is estimated that at least 80,000 Maryland residents have a drinking problem sufficiently serious to interfere with their normal family relations and work habits. This figure would indicate that one family out of every ten has a member who is an alcoholic.

In recent years the number of alcoholic admissions has increased proportionally faster than other admissions. In 1960, 25.0% (1,161) of all admissions were diagnosed as alcoholics. This increased to 26.3% (1,330) in 1961; 28.6% (1,502) in 1962; 30.4% (2,188) in 1963; 31.2% (2,449) in 1964; and 32.7% (2,794) in 1965. Preliminary data for the 1966 fiscal year indicate a figure in excess of 3,200 admissions for alcoholism.

Alcoholic patients come from all parts of Maryland and from all socioeconomic and cultural strata. Statistical figures from last year's hospital admissions revealed: (1) 42% had elementary school education, 45% attended high school and 9% had some college training; (2) 65% were white males, 10% were white females, 21% were nonwhite males and 4% were nonwhite females: (3) 25% were Catholic, 70% were Protestant and 0.3% were Jewish; (4) 3% were less than 25 years old, 53% were between 25 and 44 years old, 41% were 45-64 years of age, and the remaining 3% were 65 years and older.

Although half of the alcoholic patients are self-admitted, many lack the motivation necessary for successful treatment. The unmotivated alcoholic poses a difficult challenge to the hospital staff. The problem of repeated hospitalization is higher than among other patients since successful treatment requires sustained abstinence, the development of constructive influences for continued sobriety, and the resolution of the underlying factors related to the alcoholism problem. To achieve this requires extended professional supportive services which, in many parts of Maryland, are woefully inadequate. The average length of hospitalization for the alcoholic is much shorter than for other patients. Hospitalization is just one phase of a range of programs needed to treat alcoholics. Recent data indicate that one-tenth are

This "case history" runs to some 10,000 pages

This is a typical "case history" of one new drug—or, rather, a proposed new drug—assembled for submission to the U.S. Federal Food and Drug Administration. These volumes are the result of several years' work by thousands of professional and skilled personnel in just one pharmaceutical company's research laboratories, and by hundreds of physicians in medical schools, hospitals, and private practice. They cover every aspect of experience with this proposed new agent from chemical laboratory to clinic, from mouse to man. Each volume could conceivably represent hundreds of thousands of dollars of financial investment, countless hours of human effort. This veritable mountain of data stands behind every new agent offered to you by pharmaceutical manufacturers—a reassuring testimonial to the efficacy, safety and purity of the drugs you will prescribe today to lower the cost of disease to your patients.

discharged within one week, one-fourth within two weeks one-half within one month, and almost all within one year.

We need to know more about psychological, physiological and sociocultural factors influencing the incidence of alcoholism. Ultimate success depends on programs to minimize the occurrence of this disease and on early diagnosis and treatment of alcoholics. This requires the expansion and close coordination of psychiatric hospital and outpatient services, public agencies, community groups, and interested and informed individuals.

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

ABBOTT

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 table sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

all long-release vehicles are same. Here is why the Gradumet different and what it means r your overweight patients.

release action is purely physical and relies on one factor common to every patient: gastro-stinal fluid. There is no dependence on enteric tings, enzymes, motility, or an "ideal" ion con-tration in the gastrointestinal tract.

our patients get a measured amount of medi-on, moment by moment, throughout the day. ey are not subjected to ups and downs of release . . . or to erratic release from patient atient . . . or to erratic release in the same ent from day to day.

t's why the Gradumet provides trolled-release as well as g release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

Collection Routine

Part II: Using Intraoffice Techniques

WILBURN L. McCLURE, JR.

You have sent several bills, regularly and promptly. You are reasonably sure that all charges are understood. You know of no reason, expressed or implied, why the patient has not paid.

If you are not convinced that the account is ready to be referred for collection, what are some of the systems used to encourage payment? What type of results can you expect from each?

Personal Letters.—They can bring excellent results. The trouble is that most are *too wordy* and lack the prime requisite of *being specific*. Such letters should review the entire account, ask if all is understood, and ask for a payment. You may wish to conclude with a request for an explanation or commitment if full or partial payment is not presently possible. The latter, however, often puts the patient on notice that you are open to "excuses."

EXAMPLE

Dear Mr. Grind:

Since August of 1965, I have rendered medical services to you, your wife, and family. Your account now stands at $189. I last received a payment (of $15) on December 3rd.

As far as I know, all fees have been understood. If not, I am willing to review each one.

Please pay all or at least a reasonable portion of your outstanding balance this week.

In the event full or partial payment is not possible, write or call in *an explanation of your tardiness, as well as an indication as to when I might expect your remittance.*

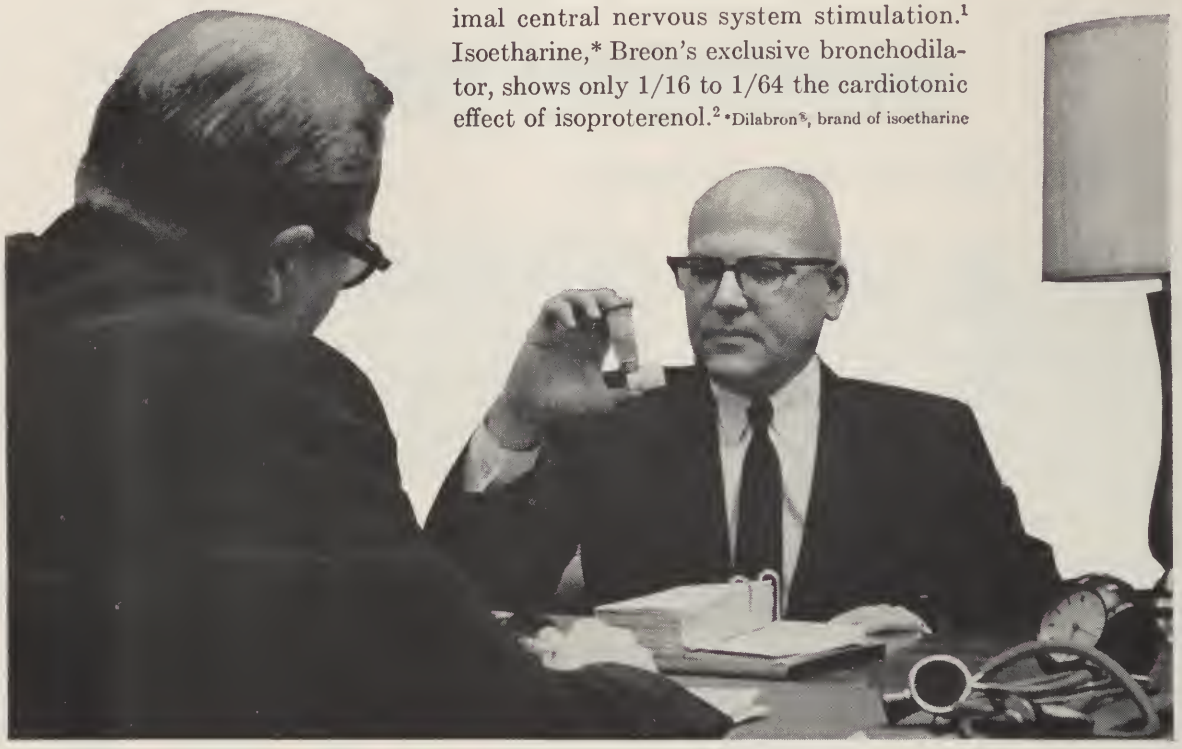
Sincerely yours,

Remember, be specific. Be positive. Let the patient be the expert in vague generalities.

Messages on Bills—If you have sent several bills with no response, should you include handwritten or typed notes on the next one? Generally, the messages used are "Please" or "Your early remittance will be appreciated."

If you want to use this approach, it might be better to say, "Please phone the office today, the doctor requires an explanation concerning this delinquent account."

Again, be positive.



Stickers and Stamps—Success with such procedures as applying collection stickers or rubber stamp messages is almost nonexistent. They look unprofessional and appear as if you are not serious about putting your message across.

Telephone Calls—Some doctors use the phone to collect past due accounts. But for the most

Mr. McClure is director of the Baltimore office of Professional Business Management, Inc. This monthly column is prepared as a complimentary service to the *Maryland State Medical Journal.*

"I like Bronkometer... I breathe better... don't get the jitters."

Patients feel relaxed with Bronkometer. Its bronchodilator-decongestant action has minimal central nervous system stimulation.[1] Isoetharine,* Breon's exclusive bronchodilator, shows only 1/16 to 1/64 the cardiotonic effect of isoproterenol.[2] *Dilabron®, brand of isoetharine

BRONKOMETER® ASTHMA, CHRONIC BRONCHITIS, EMPHYSEMA

isoetharine 0.6%; phenylephrine 0.125%; thenyldiamine 0.05%—Superior because it contains isoetharine

COMPOSITION: Bronkometer delivers at the mouthpiece 200 metered doses of: 350 mcg isoetharine methanesulfonate (0.6%); 70 mcg phenylephrine HCl (0.125%); and 30 mcg thenyldiamine HCl (0.05%) with saccharin, menthol and fluorochlorohydrocarbons as inert propellants. Preserved with ascorbic acid 0.1% and alcohol 30%.

RECOMMENDED DOSAGE: One or two inhalations with at least one minute between inhalations. Occasionally more may be required, however in most cases, inhalations need not be repeated more than every four hours. Dosage should be adjusted to the severity of the condition and to patient's response.

PRECAUTIONS: Bronkometer is unusually free from cardiovascular and other side effects, but the usual precautions associated with sympathomimetic amines should be observed. Bronkometer should not be administered simultaneously with epinephrine or similar compounds because of the possibility of tachycardia, although it may be alternated with these agents. Dosage must be carefully adjusted in patients with hyperthyroidism, hypertension, acute coronary disease, cardiac asthma, limited cardiac reserve and in individuals sensitive to sympathomimetic amines.

SUPPLIED: 10 ml pressurized aerosol vials complete with measured dose valve and oral nebulizer.

References: 1. Spielman, A. D.: *Curr. Therap. Res.* 3:235 (June) 1961. 2. Herschfus, J. A.; Bresnick, E.; Levinson, L.; and Segal, M. S.: *Ann. Allergy* 9:769 (Nov.-Dec.) 1951.

BREON **BREON LABORATORIES INC.** 90 Park Avenue, New York, N.Y. 10016

part, an aide generally does this work.

Here are some good rules to follow:

1. Be sure you are talking to the party responsible for paying the account.
2. Identify yourself.
3. Immediately state the purpose for calling.
4. Record all responses.
5. Review conclusions of conversation.

EXAMPLE

"Hello. May I speak to Mr. Keith R. Grind, Jr."

"Mr. Grind, this is Mrs. Mary Rush, Dr. Kermit Long's secretary."

"Mr. Grind, your account balance is now $189. Dr. Long received one payment last December. When can he expect the balance?"

"All right, Mr. Grind. I'll tell Dr. Long that you will send him a check today for $100 and $25 each month thereafter until the account is paid."

Facts. Positive facts. They put the patient on notice that you know what you are talking about, and that you intend to collect your fees.

NAME _____

ADDRESS _____

The synthesis of cortisone was accomplished by Merck Sharp & Dohme in 1948—the famous "Compound E" used by Dr. Philip Hench in his historic experiment at the Mayo Clinic.

But proud as we are of our role in the development of cortisone and subsequent corticosteroids, we have continued to seek a greater understanding of arthritic disorders and new drugs for their treatment.

One such drug—INDOCIN® (indomethacin), a nonsteroid, anti-inflammatory agent fundamentally different in structure and activity from other drugs in use—was recently made available for the treatment of arthritic conditions. It opens new possibilities for the long-term management of arthritis and inflammatory disease.

MSD **MERCK SHARP & DOHME** | **where today's theory is tomorrow's therapy**
Division of Merck & Co., INC., West Point, Pa.

INDOCIN®

INDOMETHACIN

Indications: Chronic and acute rheumatoid arthritis, rheumatoid (ankylosing) spondylitis, degenerative joint disease (osteoarthritis) of the hip, and gout.
Contraindications: Active peptic ulcer, gastritis, regional enteritis, or ulcerative colitis. Safety in pregnancy has not been established. Not recommended for pediatric age groups.
Warning: Patients who experience dizziness, lightheadedness, or feelings of detachment on INDOCIN should be cautioned against operating motor vehicles, machinery, climbing ladders, etc. Use cautiously in patients with psychiatric disturbances, epilepsy, or parkinsonism.
Precautions and Adverse Reactions: Most commonly, headache, dizziness, lightheadedness, G.I. disturbances. The C.N.S. effects are often transient and frequently disappear with continued treatment or reduced dosage. The severity of these effects may occasionally require cessation of therapy. G.I. effects may be minimized by giving the drug with food or with antacids or immediately after meals. Ulceration of the stomach, duodenum, or small intestine has been reported and, in a few instances, severe bleeding with perforation and death. Gastrointestinal bleeding with no obvious ulcer formation has also been noted; INDOCIN should be discontinued if G.I. bleeding occurs. As a result of G.I. bleeding, some patients may manifest anemia, and for this reason periodic hemoglobin determinations are recommended. Rare reports of effects not definitely known to be attributable to INDOCIN include bleeding from the sigmoid colon (either from a diverticulum or without a known previous pathologic condition), perforation of preexisting sigmoid lesions (diverticulum, carcinoma), and hematuria. In other rare cases, a diagnosis of gastritis has been made while the drug was being given. One patient developed ulcerative colitis, and another, regional ileitis, while receiving INDOCIN; when the drug was given to patients with preexisting ulcerative colitis, there was an increase in abdominal pain. Infrequently observed side effects may include drowsiness, tinnitus, mental confusion, depression and other psychic disturbances, blurred vision, stomatitis, pruritus, edema, and hypersensitivity reactions. Slight BUN elevation, usually transient, has been seen in some patients, although the preponderance of evidence indicates that INDOCIN does not adversely affect renal function, even in patients with preexisting renal disease. Nevertheless, renal function should be checked periodically in patients on long-term therapy. Leukopenia has been seen in a few patients. Transient elevations in alkaline phosphatase, cephalin-cholesterol flocculation, and thymol turbidity tests have been observed in some patients and, rarely, elevations of SGOT values; the relationship of these changes to the drug, if any, has not been established. As with any new drug, patients should be followed carefully to detect unusual manifestations of drug sensitivity.
Before prescribing or administering, read product circular with package or available on request.

SLEEP ZONE

To turn a hospital zone into a sleep zone, you need more than peace and quiet. Your patients need a mattress which gives the right kind of firm, comfortable support. To hospitals across the country, this means the Serta Perfect Sleeper "Hospital" mattress.

It provides restful, healthful sleep, because the patient sleeps **on** it, not in it. And just as important to you, the Serta Perfect Sleeper retains its firmness for years and years of service.

Interested? There's a Serta contract bedding expert near you. Let him help you choose from the comprehensive range of specifications on Serta quality bedding.

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

OCTOBER, 1966

AMA-ERF Fun(D) Day

November 10 is the date of the Woman's Auxiliary's annual FUN(D) DAY, held each year to raise money for the AMA Educational and Research Foundation. Each local auxiliary will sponsor a booth in Osler Hall, the Faculty Building, from 11:00 AM to 3:00 PM. The admission charge of one dollar will include lunch and a chance to win a door prize.

Mrs. Archie R. Cohen, president of the Auxiliary, and Mrs. Wallace H. Sadowsky, president-elect, are co-chairmen of the project. They urge every doctor's wife to participate.

Mental Health News

Mrs. Irving J. Taylor, who is Mental Health Committee chairman in the Woman's Auxiliaries to both the Medical and Chirurgical Faculty of the State of Maryland and the Baltimore City Medical Society, has announced a new project for the City Auxiliary's Mental Health Committee, in which all State Auxiliary members are invited to participate. A volunteer program for the Psychiatric Day Center in Baltimore City, this project has already won the support of almost 50 women, who have agreed to spend at least half a day during the year donating their services at the Center.

At the invitation of Gertrude Gross, MD, director of the Center, fourteen of these women attended a meeting there and were taken on a tour of the facilities. Mrs. Taylor reports that they were all very much impressed with the work being done, and that a registered nurse and a dentist, who joined the group for the tour, volunteered their services "on the spot." She stresses the fact, however, that many more volunteers are needed.

As a tie-in with this new mental health program, Albert A. Kurland, MD, spoke on "LSD in Experimental Psychotherapy" at the first meeting of the City Auxiliary on October 12. Mrs. Taylor's future plans include a seminar on the subject of suicide, and visits to psychiatric facilities in the area.

Montgomery County

The Auxiliary to the Montgomery County Medical Society held its first luncheon and business meeting of the season at the Linden Hill Restaurant in Bethesda on September 20. Mrs. Norman Oliver and Mrs. William D. Aud were co-chairmen of the luncheon.

Book Reviews

THE NEUROENDOCRINE CONTROL OF ADAPTATION, by K. Lissák and E. Endröczi, Pergamon Press, 1965. $11

This book contains a comprehensive and critical account of the way in which the central nervous system controls those endocrines concerned with the adaptation of an animal to its environment.

LEXICON ALLERGOLOGICUM, edited by Knud Wilken-Jensen, Pergamon Press, 1966. $5

Published under the auspices of the European Academy of Allergology, this is a six-language dictionary of allergological terms. It contains terminology, explanation of the terminology, and a list of the most common allergens. The languages are English, German, French, Italian, Russian, and Spanish.

MEDICAL CARE RESEARCH, edited by Kerr L. White, MD, Pergamon Press, 1966. $7.50

This book contains the proceedings of a symposium on Medical Care Research. The collection of articles has been published in the *Journal of Chronic Diseases*, Vol. 17, 1964.

The symposium represents current problems and methods in the field as found in the United States and Great Britain. The papers have been selected to illustrate research primarily concerned with personal health services provided by physicians and nurses, either in offices and clinics or in hospitals and nursing homes.

References accompanying the papers give a comprehensive guide to the literature in this field.

PATHOLOGY, vols 1 and 2, ed 5, edited by W. A. D. Anderson, MD, C. V. Mosby Co., 1966. $21

This edition retains the original objective to provide a comprehensive, thorough, and balanced coverage of pathology. It is intended as a reference for the medical student and the physician in clinical practice. Changes and additions have been made as necessitated by new knowledge.

DISEASES OF THE HEART, ed 3, by Charles K. Friedberg, MD, W. B. Saunders, 1966.

This edition represents extensive revisions and additions. The chapters were updated right up until press time to include current investigation still in press or being prepared for publication. The newer diagnostic methods have been discussed extensively, and therapeutic advances are presented in detail.

new small size

Synalar® 0.01%
(fluocinolone acetonide) **cream**
15 Gm.

for even greater economy in office or hospital practice

the superiority topical with the

Now you can prescribe as little or as much Synalar Cream 0.01% as is needed for a particular therapeutic problem in a size that permits the greatest economy for your patient. The new 15 Gm. tube, for example, is best suited for short-term therapy and for small sites. For more extensive body areas prescribe the 45 Gm. tube—a size that's also ideal for your treatment table. And the 120 Gm. jar is most economical for hospital use. Thus, with Synalar Cream 0.01%, you have the superiority of a modern topical corticosteroid shown to be more effective than 1% hydrocortisone[1-3] plus the economy that makes therapy practical for use in more dermatologic conditions, in long-term maintenance, with occlusive dressings in resistant cases, and in extensive area involvement.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** 1. *General*—Synalar Cream 0.01% is virtually nonsensitizing and nonirritating. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. 2. *Occlusive dressing method*—With occlusion of extensive areas, systemic absorption of the corticosteroid may occur, and suitable precautions should be taken. Occasional patients may show contact sensitivity to a particular dressing material or adhesive. Miliaria, folliculitis, or pyodermas have been seen infrequently with the use of this technique. The development of infection requires appropriate antibacterial therapy and discontinuation of the occlusive dressing method. Local atrophy and striae have been reported with protracted occlusive dressing therapy. While lesion relapses can be expected to occur in many psoriatic patients, remissions may persist for several weeks to several months in favorable cases. The patient whose psoriasis is in an active stage, with recent appearance of new lesions, may not be a good candidate and may show early relapse. Some plastic films may be flammable, and due care should be exercised in their use. Similarly, caution should be employed when such films are used on or left near children to avoid the possibility of accidental suffocation. **Side Effects:** Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. **References:** 1. Cahn, M. M., and Levy, E. J.: J New Drugs 1:262 (Nov.-Dec.) 1961. 2. Meenan, F. O.: J Irish Med Ass 52:75 (Mar.) 1963. 3. Robinson, H. M., Jr., Raskin, J., and Dunseath W. J. R.: Southern Med J 56:797 (Jul.) 1963.

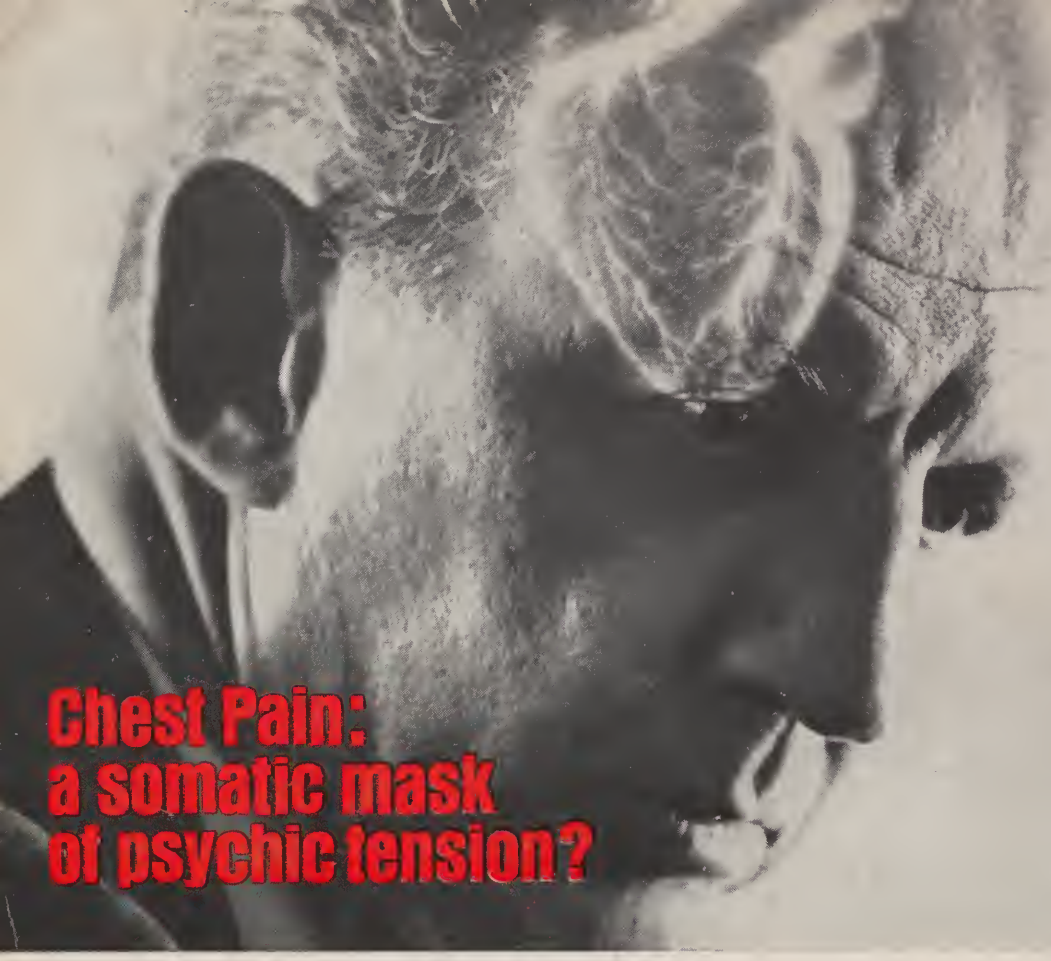
Blood-glucose screening for all your patients?

...because "Abnormalities of glucose metabolism are among the [most common] encountered in clinical practice...."* Simple, quick, economical blood-glucose screening with DEXTROSTIX® Reagent Strips is practicable in every regular physical examination, emergency situation, and whenever hypo- or hyperglycemia may be of clinical significance—for "The precision and accuracy of DEXTROSTIX ...meet the need for an always available simple screening method...."* All that is required for screening with DEXTROSTIX is 60 seconds and a globular drop of capillary or venous blood. Abnormal readings will be a valuable aid to diagnosis; normals will help you establish an important baseline for future reference.

*Marks, V., and Dawson, A.: Brit. M. J. 1:293, 1965.

DEXTROSTIX—
provides a clinically useful determination when performed according to directions†



†DEXTROSTIX is not intended to replace the more precise analytical laboratory methods.

Yes—all your patients

AMES COMPANY, INC.
Elkhart, Indiana

AMES

09165

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

NEUROTIC FATIGUE—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be alleviated by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage — Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

some allergens are red...

whatever their color, shape, or size...

Benadryl®

(diphenhydramine hydrochloride)

PARKE-DAVIS

for control of allergic symptoms

Whether the allergen is red and round, or unseen and unknown, BENADRYL provides relief of symptomatic distress through its antihistaminic and antispasmodic actions. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with BENADRYL should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENADRYL. *SIDE EFFECTS:* Side reactions, commonly associated with antihistaminic therapy and generally mild, may affect the nervous, gastrointestinal, and cardiovascular systems. Most frequent reactions are drowsiness, dizziness, dryness of the mouth, nausea, and nervousness. BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00666

in vivo measurement of LUTREXIN (Lututrin) on contracting uterine muscle

Diagnosis:

cystitis?
pyelonephritis?
pyelitis?
urethritis?
prostatitis?

in any case,
usually gram-negative*

Therapy:

two 500 mg. Caplets® q.i.
(initial adult dose)

Indications: Urinary tract infections caused by gram-negative and some gram-positive organisms.

Side effects: Mainly mild, transient gastrointestinal disturbances; in occasional instances, drowsiness, fatigue, pruritus, rash, urticaria, mild eosinophilia, reversible subjective visual disturbances (overbrightness of lights, change in visual color perception, difficulty in focusing, decrease in visual acuity and double vision), and reversible photosensitivity reactions. Marked overdosage, coupled with certain predisposing factors, has produced brief convulsions in a few patients.

Precautions: As with all new drugs, blood and liver function tests are advisable during prolonged treatment. **Pending further experience, like most chemotherapeutic agents, this drug should not be given in the first trimester of pregnancy. It must be used cautiously in patients with liver disease or severe impairment of kidney function.** Because photosensitivity reactions have occurred in a small number of cases, patients should be cautioned to avoid unnecessary exposure to direct sunlight while receiving NegGram, and if a reaction occurs, therapy should be discontinued. The dosage recommended for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Bacterial resistance may develop.

When testing the urine for glucose in patients receiving NegGram, Clinistix® Reagent Strips or Tes-Tape® should be used since other reagents give a false-positive reaction.

Dosage: Adults: Four Gm. daily by mouth (2 Caplets® of 500 mg. four times daily) for one to two weeks. Thereafter, if prolonged treatment is indicated, the dosage may be reduced to two Gm. daily. Children may be given approximately *25 mg. per pound* of body weight per day, administered in divided doses. The dosage recommended above for adults and children should not arbitrarily be doubled unless under the careful supervision of a physician. Until further experience is gained, infants under 1 month should not be treated with the drug.

How supplied: Buff-colored, scored Caplets® of **500 mg. for adults,** conveniently available in bottles of 56 (sufficient for one full week of therapy) and in bottles of 1000. **250 mg. for children,** available in bottles of 56 and 1000.

a specific anti-gram-negative

eradicates most urinary tract infections...

- Low incidence of untoward effects; no fungal overgrowth, crystalluria, ototoxic or nephrotoxic effects have been observed.
- "Excellent" or "good" response reported *in more than 2 out of 3* patients with either chronic or acute gram-negative infections.[1]

*As many as 9 out of 10 urinary tract infections are now caused by gram-negative organisms: E. coli, Klebsiella, Aerobacter, Proteus, Paracolon or Pseudomonas[2]... However, infections of the urethra and prostate caused by non-gonococcal gram-negative organisms are believed to be less prevalent.

What to Do About Christmas Gifts 165

Most of my patients with high blood pressure are as old as I am. A lot of them are living on pensions. They're grateful when I can keep prescription costs down.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down

Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Saroh

Well, Doctor Cunningham, I was just telling Herbert I should talk to you about my cough. It comes from down here and...

Chances are the symptom recital may prove to be as difficult to control as the cough. If it's the useless, exhausting type of cough that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh, grape flavor of Novahistine DH appeals to children and adults alike.

When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial obstruction.

Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.

Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

MEDICAL AND CHIRURGICAL FACULTY

ANNUAL MEETING—APRIL 19, 20, 21, 1967

THE ALCAZAR, BALTIMORE

Scientific sessions of interest to physicians in all fields of medicine are being planned for the 1967 Annual Meeting by the Committee on Program and Arrangements. Among the guest speakers will be the following outstanding men of medicine:

Milford O. Rouse, MD, president-elect, American Medical Association
James F. Holland, MD, chief of medicine, Roswell Park Memorial Institute
Walter L. Henry, MD, professor of medicine, Howard University
Richard E. Palmer, MD, professor of pathology, George Washington University School of Medicine
Edgar S. Gordon, MD, professor of medicine, University of Wisconsin Medical Center
Michael E. De Bakey, MD, professor of surgery, Baylor University College of Medicine

In addition, there will be a kidney symposium covering the subjects of chronic dialysis, transplantation, bacteria urea and urinary tract infections, and glomerulonephritis.

To keep the physicians of Maryland abreast of scientific advancement, there will be many technical and scientific exhibits. Any member of the Faculty, who has a scientific exhibit he would like to display, should contact the Committee. All exhibits accepted will be eligible for the $200 award to be presented by the Mead Johnson Company for the most outstanding scientific exhibit. The Faculty Committee will judge the exhibits.

The always popular and well attended Round Table Luncheon has been scheduled at the "One West" restaurant on Wednesday, April 19. On Thursday, April 20, at the Sheraton-Belvedere Hotel, the annual Presidential Dinner (with the best of professional entertainment) will be held. The House of Delegates of the Faculty will meet on April 19 at the Alcazar and on April 21 in the Faculty Building.

NOTE THESE DATES NOW

APRIL 19, 20, 21, 1967

Committee on Program and Arrangements
James B. Brooks, MD, Chairman

Your MEDICAL FACULTY at Work

JOHN SARGEANT — EXECUTIVE SECRETARY

House of Delegates, September 9

1. Two amendments to the Medicolegal Code of Cooperation were adopted, the first related to reports of an attending physician to a patient or his attorney, the second to referrals of a patient by attorneys to another physician without the knowledge of the treating physician.

2. The Building Committee was dissolved by unanimous vote and the funds under its control transferred to separate Building Fund accounts.

3. The House rejected a resolution which would have instructed the Legislative Committee to propose a bill to the State Legislature amending the Medical Practice Act to allow certain corporate practice.

4. It was resolved that the Faculty's Liaison Committee review the numerous requisition forms of various departments, companies and agencies, and hold hearings where physicians could voice their grievances, with a view to eliminating as much cumbersome paper work as possible.

5. The House rejected a resolution to the effect that the Faculty use its offices to persuade the State Commissioner of Health to rescind his directive excluding the practicing physician's screening activity from the benefits of the Maryland State Department of Health Laboratory Services.

6. A resolution was adopted to urge the Maryland Blue Shield Plan to develop a program covering professional fees based on reasonable and customary charges and to bend every effort toward the substitution of the new program for the present fee schedule program.

7. It was resolved that the Faculty, with the Maryland State Department of Health, should immediately develop a health care program for the disadvantaged (under the provisions of Title XIX of Public Law 89-97) providing for all payments for professional services on the basis of usual, customary and reasonable charges; that all physicians should be urged henceforth to *bill* on this basis (despite the fact that *payments* must presently be made on the basis of budgeted funds) in order to demonstrate the extent to which physicians are now subsidizing the Medical Care Program; and that copies of the resolution be sent to various key State officials.

8. The House went on record as urging its members to bill on the basis of usual, customary and reasonable fees for professional services rendered Workmen's Compensation Cases as well as other government cases.

9. The House also went on record as opposing the compulsory assessment of hospital staff members for hospital construction or equipment.

10. The MEDIC network for the 1967 calendar year was approved.

Executive Committee, October 6

1. Subject to his right of appeal as provided in the Faculty Bylaws, and subject to approval of legal counsel, the six-month suspension of membership of Leonard Flax, MD, was voted to take effect 30 days after receipt of disposition of his

case by him. (Dr. Flax has appealed this decision to the Judicial Council of the American Medical Association.)

2. On the recommendation of the Treasurer, an expenditure of $2,000 was voted for roof repairs as part of the Faculty's continuing renovation program.

3. The Committee authorized the expenditure of up to $100 for AMA pamphlets on "Alcoholism" for distribution by Component Societies to schools in the area.

4. The Committee reviewed a list of appointments to various AMA councils, committees and boards scheduled for the consideration of the AMA Board of Trustees and, except for non-members of the Faculty or AMA, voted approval of the list.

5. Donald E. Fisher, MD, and B. Martin Middleton, MD, were selected as Faculty representatives to the Congress on Socioeconomics of Health Care, to attend at AMA expense.

6. The Committee voted for an expression of appreciation to A. Gibson Packard, MD, for the time he spent as Faculty representative to a meeting on Vocational Rehabilitation.

7. The following recommendations to the Motor Vehicles Commissioner for appointment to the Department's Medical Advisory Board were approved: A. H. Oleynick, MD; Frank F. Schuster, MD; and Edward F. Wenzlaff, MD, all of Baltimore.

8. The Committee voted approval of the content of a pamphlet on laws, rules and regulations with which physicians must comply, the pamphlet having already been cleared by the State Health Department, legal counsel and others. The estimated cost of printing 5,000 copies will be obtained.

Behind continued high blood pressure readings lies the possibility of organic damage[1-13]

MANY OF THE aspects of essential hypertension are unpredictable—either because there are a number of mechanisms involved or because individuals differ in their responses to these mechanisms.[1]

There is one aspect of hypertension, however, that seems, in many cases, predictable. ". . . when the blood pressure is elevated to a marked degree for an adequate period of time, this in itself leads to perpetuation of the syndrome with resulting vascular damage throughout the body."[14] All too often the disease progresses until there is damage to one of three vital organs: the heart, the kidney, the brain.

"Hypertension is certainly a major factor in the genesis of coronary heart disease, and it is even more important when compounded with obesity."[4]

"[Vascular deterioration] can be clearly seen in the kidney with a degree of damage that can be measured by renal function studies."[10]

". . . most evidence suggests that reduction of blood pressure, when it is too high, not only relieves the heart of excess work but reduces vascular damage."[1]

"In short, treatment is indicated."[1]

Antihypertensive therapy will not restore the blood vessels to normal. Yet many of the vascular changes and symptoms caused by increased blood pressure may be arrested or alleviated when the blood pressure is reduced to normotensive levels.[7]

Reducing the blood pressure helps curtail further vascular damage and improves the prognosis — when damage is not too far advanced before therapy is started.[14] Essential hypertension is an indication not only for treatment, but for *early* and adequate treatment of the patient in question.

Reduce the blood pressure with Rautrax-N

Rautrax-N combines the antihypertensive-tranquilizing action of whole root rauwolfia with the antihypertensive-diuretic action of bendroflumethiazide in one convenient medication. The two drugs complement each other so that smaller doses of both are possible.

Rauwolfia combined with bendroflumethiazide is particularly effective in long-term therapy,[15-17] since beneficial effects do not diminish with continuous daily administration.

For most patients 1 or 2 Rautrax-N tablets daily are sufficient for maintenance therapy. The simplicity, convenience and economy of such a dosage schedule are of particular benefit to older patients.

Contraindications: Severe renal impairment or previous hypersensitivity. **Warning:** Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting or G.I. bleeding occur.

Precautions and Side Effects: The dose of ganglionic blocking agents, veratrum or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Caution is indicated in patients with depression, suicidal tendencies, peptic ulcer; electrolyte disturbances are possible in cirrhotic or digitalized patients. Marked hypotension during surgery is possible; consider discontinuing two weeks prior to elective surgery and observe patients closely during emergency surgery. Rauwolfia preparations may cause reversible extrapyramidal symptoms and emotional depression, diarrhea, weight gain, edema, drowsiness may occur. Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients, and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, rashes may occur.

Dosage and Supply: Initial dosage, 1 to 4 tablets daily, preferably at mealtime. Maintenance, 1 or 2 tablets daily. Rautrax-N is supplied as capsule-shaped tablets containing 50 mg. Rauwolfia serpentina whole root (Raudixin®), 4 mg. bendroflumethiazide (Naturetin®), 400 mg. potassium chloride.

Also available: Rautrax-N Modified — capsule-shaped tablets containing 50 mg. Rauwolfia serpentina whole root (Raudixin), 2 mg. bendroflumethiazide (Naturetin), 400 mg. potassium chloride. Both potencies available in bottles of 100. For full information, see Product Brief.

RAUTRAX®-N

Squibb Rauwolfia Serpentina Whole Root (50 mg.) with Bendroflumethiazide (4 mg.) and Potassium Chloride (400 mg.)

EXECUTIVE SECRETARY'S NEWSLETTER

November, 1966

DEPENDENTS' MEDICAL CARE CHANGES

Changes in the Dependents' Medical Care program have been made known by the U. S. Government. Basically, they provide for payment of out-patient services, on the basis of a $50.00 per person or $100.00 per family deductible program, plus payment by the government of 80% of the balance due. Full details will be contained in a bulletin distributed to all physicians by Maryland Medical Service, fiscal agents for this program.

ANNUAL MEETING RESOLUTIONS

Resolutions for consideration at the Faculty's Annual Meeting should be received in the Faculty office by:

WEDNESDAY, FEBRUARY 22, 1967

No date has been set for the Reference Committee hearing as yet, but a general notice will appear as soon as it is scheduled.

PHYSICIAN REMINDERS

Physicians are reminded they are required to report suspected cases of Child Abuse to the local Welfare Department within 24 hours of them coming to their attention. Penalties are in the law for failure to comply.

Physicians are also reminded that the police continue to report sample drugs are being retrieved from trash cans and being used for illegal purposes. Once again, this important point is brought to the attention of all those concerned for corrective action. Do any of your secretaries do this without your knowledge?

MEDICAL ASPECTS OF SPORTS

One of the Faculty's newest Subcommittees is on the Medical Aspects of Sports; and is interested in comments, suggestions and questions on activities in which it can engage. The first meeting of this group was held in October. Chairman is John B. DeHoff, M.D., Baltimore. The Subcommittee is, initially, involving itself in elementary and high school athletic programs.

NEWS NOTES

William B. Vandegrift, M.D., F.A.C.P., has opened offices for the practice of diagnostic cytology and tissue pathology in Ruxton, Md.

Thomas L. Worsley, M.D., has removed his office to 6505 York Road, Baltimore.

Francis T. Daly, M.D., Baltimore, is now certified by the American Board of Internal Medicine.

The Third National Conference on Work Evaluation Units, sponsored by the Heart Association of Maryland, will hear Drs. Francis J. Borges and Donald H. Dembo, as panelists on "As Team Members See Themselves in WEU Operations."

Nathan W. Shock, M.D., Bethesda, has been named President-elect of the International Association for Gerontology.

Jacob H. Conn, M.D., Baltimore, presented the Adolf Meyer lecture at the 18th annual meeting of The Society for Clinical and Experimental Hypnosis in New York City.

WORK LABOR PERMITS

In order to further clarify the question of completion of Work Labor Permits for minors, the following advice is provided:

1. The "application" for Work Labor Permit may be completed by any physician. Charge for this examination and completion is paid by the patient.
2. The "Permit" itself is <u>issued</u> by Authorized Physicians only. The medical statement on this permit is not completed if the physician did not examine the minor.
3. The "Permit" need not be issued by a local or Authorized Physician, but the "Application" may be mailed to the Baltimore office of the Department of Labor and Industry for issuance of the "<u>Permit</u>" without further charge.

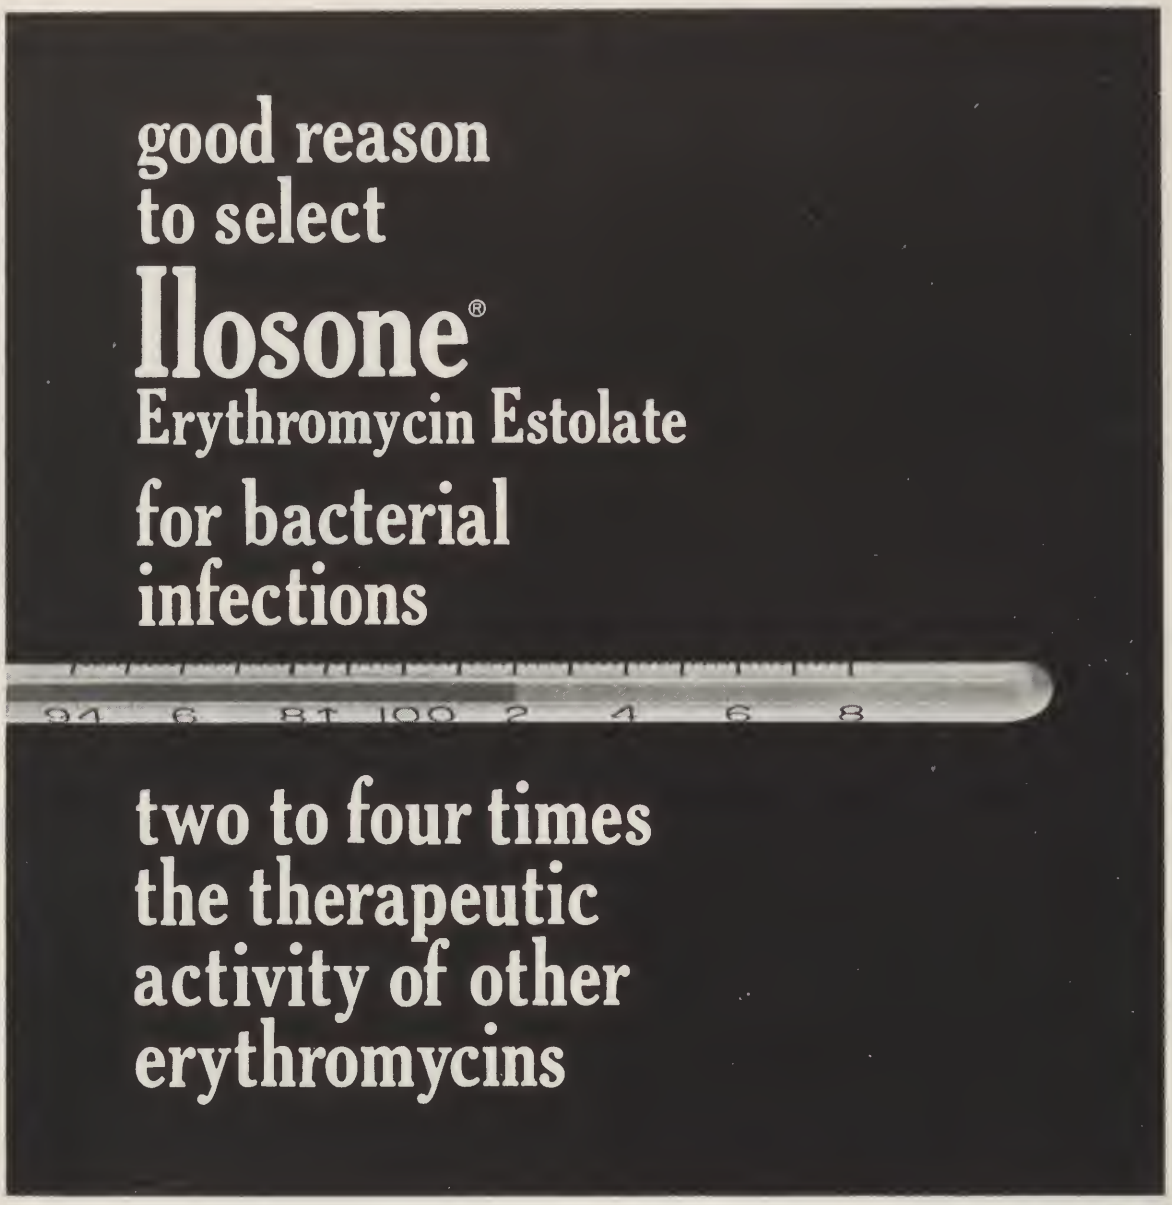
IDENTICAL BREAST FORM

A COMPLETELY SATISFACTORY BREAST PROSTHESIS NOW AVAILABLE



This form, designed specifically for the use of mastectomy patients, not only achieves an excellent cosmetic result but also meets the patient's previously over-looked physiologic needs.

It succeeds in realistically stimulating normal breast tissue because of its scientific construction.

Even on very close contact this prosthesis is indiscernible for it is capable of assuming body temperature.

There is a wide range of sizes and the price brings it within the reach of the average patient.

CONTRAINDICATIONS: Ilosone is contraindicated in patients with a known history of sensitivity to this drug and in those with preexisting liver disease or dysfunction.

SIDE-EFFECTS: Even though Ilosone is the most active oral form of erythromycin, the incidence of side-effects is low. Infrequent cases of drug idiosyncrasy, manifested by a form of intrahepatic cholestatic jaundice, have been reported. There have been no known fatal or definite residual effects. Gastro-intestinal disturbances not associated with hepatic effects are observed in a small proportion of patients as a result of a local stimulating action of Ilosone on the alimentary tract. Although allergic manifestations are uncommon with the use of erythromycin, there have been occasional reports of urticaria, skin eruptions, and, on rare occasions, anaphylaxis.

DOSAGE: *Children under 25 pounds*—5 mg. per pound of body weight every six hours. *Children 25 to 50 pounds*—125 mg. every six hours. *Adults and children over 50 pounds*—250 mg. every six hours. For severe infections, these dosages may be doubled.

Available in Pulvules®, suspension, drops, and chewable tablets. Ilosone Chewable tablets should be chewed or crushed and swallowed with water.

Additional information available to physicians upon request.

URINARY STASIS AND URINARY INFECTIONS IN GYNECOLOGICAL AND OBSTETRICAL PATIENTS

HOUSTON S. EVERETT, MD
Associate Professor of Gynecology and Obstetrics, The Johns Hopkins University School of Medicine

Most urinary infections are associated with urinary stasis. The causes of urinary stasis in women are different from those usually found in men, and are most frequently associated with pregnancy or with gynecological diseases or therapy. Complete retention often occurs after gynecological surgery, especially operations on the anterior vaginal wall. The gynecologic causes of stasis are listed and illustrated.

Last year at our annual meeting Dr. Theodore Fetter, of Philadelphia, made the following statement: "A vast body of experimental and clinical evidence emphasizes and reinforces the well-established principles that urinary infection usually means an obstruction is present."

Except for the type of infection represented by a simple acute cystitis in female patients, which occurs often and is a spontaneous entity, I agree most heartily with this statement.

I just as heartily disagree with those internists and pathologists who have condemned the catheter as a practically lethal weapon and have assumed or postulated the diagnosis of pyelonephritis on the finding of 100,000 or more colonies of pathogenic organisms per cubic centimeter in so-called "clean catch" cultures of urine. A clean catch specimen and culture in female patients, if negative, is probably accurate; but in many women with leukorrhea, from one cause or another, it is impossible to obtain an uncontaminated specimen. Such specimens, if positive, are therefore apt to be unreliable and do not justify the positive diagnosis of any type of urinary tract infection unless confirmed by a culture of a catheterized specimen.

In an article in the January 17, 1966 issue of *The Journal of The American Medical Association,* Dr. Edward N. Cook, of the Mayo Clinic's Section of Urology, thoroughly debunked these fallacious ideas in a most delightful way.

J. Mason Hundley Annual Lecture in Gynecology, presented at the 168th Annual Meeting of the Medical and Chirurgical Faculty of the State of Maryland, April 27, 1966.

Assuming then, with Dr. Fetter, that most serious urinary tract infections are associated with obstructions, let us discuss the causes of obstruction in female patients. These often differ markedly from those found in the male and are frequently the result of gynecologic disease or therapy.

It has been known for many years that carcinoma of the cervix, when untreated or uncontrolled, eventually produces uteral obstructions. Figure 1 is an illustration of an autopsy specimen from Dr. Howard A. Kelly's *Operative Gynecology,* published in 1898, and shows a complete ureteral obstruction as a result of invasion of the broad ligament regions by the carcinoma.

My interest in this subject was first aroused during my resident year at the Johns Hopkins Hospital in 1929, when a patient who had been treated for Stage III carcinoma of the cervix by irradiation therapy 18 months before, came into the hospital with a large vesicovaginal fistula and ascites, which Dr. Guy Hunner and I were almost certain was urinary ascites (Fig 2).

This patient was already uremic and moribund, but we did attempt to relieve her obstruction by

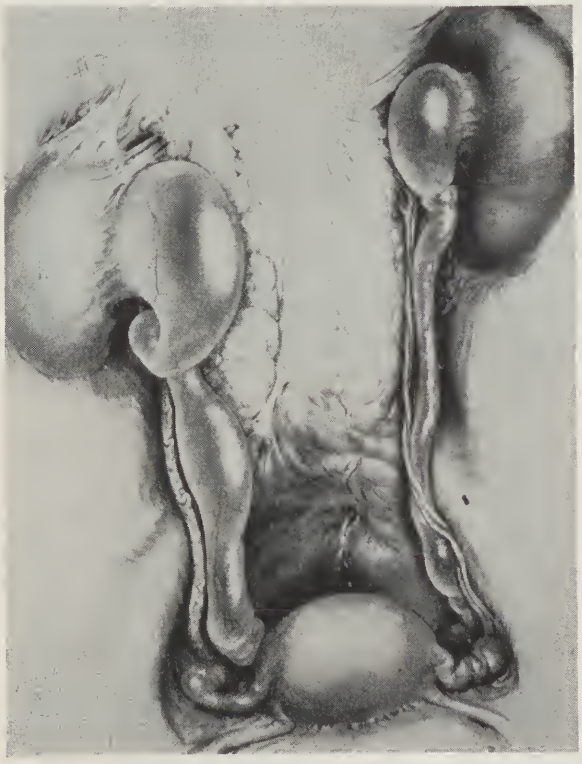

Fig 1

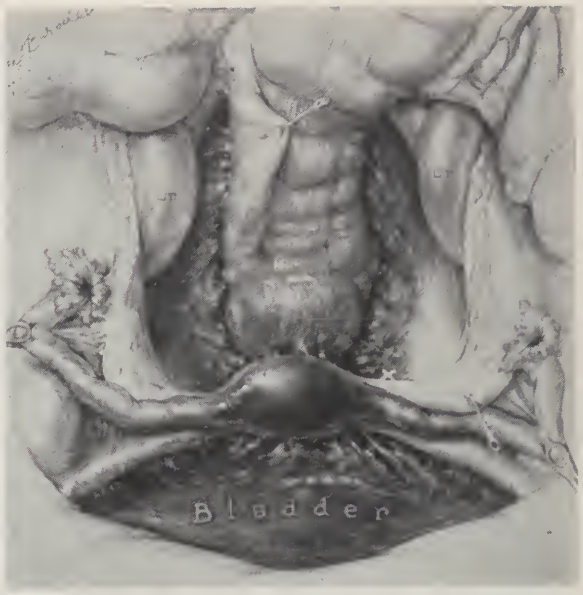

Fig 2

operation and transplantation of the markedly dilated ureters. We found that the ascites was, indeed, urinary ascites, as the left ureter was perforated at the point indicated by a white cross in Figure 2. The operation was unsuccessful. The patient died within a week. Figure 3 shows one of her kidneys, which demonstrates very well why she did. They were both just alike, but the interesting thing to me was that a very thorough autopsy revealed no remaining carcinoma.

So this patient had died as a result of having had carcinoma, but she did not die from the carcinoma. She died from the ill effects on normal tissues of the intensive radiation which was the method of treatment in those days. We had no irradiation clinic at Hopkins. We referred our patients to the Howard A. Kelly Hospital, where they were treated on an outpatient basis with a very rapid method and a relatively small dose in terms of milligram hours, of radium—only 3,000. They were treated awake. They could not be thoroughly packed, and this rapid method of irradiation had destructive effects on the normal tissues in many cases.

This case led me to undertake a study which I reported, ten years later in 1939. We studied our carcinoma of the cervix cases, both before treatment and at varying intervals after treatment. All

Fig 3

of these patients were treated by this rapid method, and about 15%-20% developed serious bladder lesions and obstructive lesions of the ureters. We also found that if pretreatment studies showed any evidence of obstruction, the prognosis was poor. This is demonstrated in Table 1. There was no dilatation in Stages I and II, but of 28 patients in Stage III there were 16 with pre-treatment dilatation and 12 without it. All 16 died in less than a year and 75% of the 12 survived five years.

Table 1

PROGNOSTIC VALUE OF URETERAL DILATATION STAGE III CARCINOMA OF CERVIX

Number of Patients	Five-year Result
16 with dilatation	All dead
12 without dilatation	75% well

We have continued these studies and now the method of irradiation is very different. Larger doses are given, usually 4,800 mgm hours of radium followed by cobalt therapy, but the radium is administered in two applications of 100 mgm for 24 hours two weeks apart. With this slower method of treatment, ill effects have been reduced from 15%-20% to about 1%.

These studies aroused my interest in the effects on the urinary tract of various gynecologic lesions and methods of treatment which we have carried out over the years, and we have arrived at a concept of the causes of obstruction in female patients.

Figure 4 shows the close relationship of the lower ureter to the genital organs. The ureter comes down following the ovarian vessels and, in the base of the broad ligament, passes behind the uterine vessels. It is close to the cervix and can

Fig 4

easily be injured during total hysterectomy if one is not careful. Any growth, such as an intraligamentous fibroid, tends to impinge upon the ureter.

Table 2 shows my idea of the causes of urinary stasis in female patients. In the male patient, the causes of stasis are more likely to be in the lower urinary tract, in the urethra, or in the vesical neck. The causes of stasis in this region in female patients are relatively rare. In this table, the underlined headings are the ones that I consider of gynecologic or obstetric interest. The others are of purely urologic interest.

Most of these conditions are rare, but postoperative retention is one which we encounter very frequently in gynecology and one which, in the last five or six years, has given rise to a great deal of discussion, and to the condemnation of the use of the catheter. The internists and pathologists who have promulgated these ideas, however, have had no actual experience with urologic problems. Their ideas have come from autopsy studies of patients who died from chronic pyelonephritis, most of whom had asymptomatic pyelonephritis and therefore never had treatment of any kind, either urologic, which should be the elimination of obstructive lesions, or medical, which should be the use of the proper medicinal agents to eradicate infection.

In my earlier days most patients having had gynecologic operations had difficulty voiding. They either had to be catheterized intermittently or have retention catheters. Now, with early ambulation, that is no longer true except for the patients who have vaginal plastic operations, particularly those on the anterior vaginal wall. But a very large percentage of those patients cannot void following operation. The operative field becomes edematous, the urethra is closed off by compression from this edema, and it is essential that the bladder be drained.

A great deal of, shall I say, gadgetry has been proposed in the last five or six years to try to manage this situation without inducing an infection. In the use of an inlying catheter, particularly in the female and regardless of how the catheter is drained, the catheter slides in and out and these patients all get infected. But these infections are bladder infections. They are not serious. They do

not lead to pyelonephritis.

To study just this matter, in the past year and a quarter Dr. Herman Long and I have obtained catheterized cultures of urine on all of our patients subjected to repairs with inlying catheters, at their first postoperative visit—usually about six weeks after discharge. There have been 25 of these patients and only one of them had a positive culture. That positive culture was in a patient who developed such a severe febrile and urticarial reaction to the sulfonamide therapy instituted for her immediate infection that it had to be discontinued within a day or two after it was started.

These patients all had infection. We used to use prophylactic drugs, but we found this didn't work. It didn't keep them from getting infected and it sometimes led to the development of drug resistant organisms. So now we obtain a culture immediately before removal of the catheter, we have sensitivity studies run on the organism obtained, and we use the drug indicated by these studies for ten days. I think the result of 24 out of 25 patients with sterile cultures at the first follow-up visit indicates that this is an entirely satisfactory procedure without all the gadgetry that has been recommended.

In an article by Dr. C. E. Cox and Dr. Frank Hinman, Jr., in the January 18, 1965 issue of *The Journal of The American Medical Association,* it was shown that in an experimental group of 80 males with normal bladders, inlying catheter-induced infections all cleared up within a few days to a few weeks after removal of the catheter, without any therapy at all. They concluded that it is hard to infect, or to maintain infection in, the normal bladder due to two things, the washing out of the bladder by normal voiding and an antibacterial effect within the bladder tissues.

Of course these gynecologic patients do not have normal bladders when the catheter is inserted. The bladder has not been subjected to actual internal trauma, but there has been trauma all around it in the dissection of the bladder and the urethra, and the urethra is, for the time being, closed off. But the bladder is very quickly returned to normal, infections clear up, and in my mind all of this business has been making a mountain out of a molehill.

Here is one situation in which we do have frequent trouble. This does not involve an actual inability to void, but occurs in patients with large cystoceles who have residual urine because a portion of the bladder is below the level of the outlet of the bladder and tends to get infected. It sometimes is infected when the patient comes in and, if the operation is to be done, an attempt should be made to clear up that infection beforehand.

If we go on to the upper level (Table 2, II), we find a great many more causes of obstruction and stasis than we do at the lower level of the female. The most frequent one of these is the so-called physiological hydronephrosis of pregnancy, which occurs in practically 100% of pregnancies. This has given rise to a tremendous literature because when this infection occurred before the days of the present drugs, it was a very serious problem. It often led to the necessity of inlying catheters in the ureters and sometimes to the termination of pregnancy. That is no longer true but, meanwhile, in this volume of literature there were two schools of thought.

One was that the causation of this was mechanical, that is, that the ureters were compressed by the enlarged pregnant uterus; the other was that the causation was hormonal—in other words, that the ureteral peristalsis was inhibited both as to strength and frequency by the presence of some hormone.

Incidentally, Dr. Herbert Traut, who at that time was at the New York Hospital at Cornell, studied this peristaltic activity and he assumed that progesterone was the hormone involved. And Dr. Hundley, who made a similar study on nonpregnant women using large doses of both estrogens and progesterone, found that the estrogens increased the peristaltic activity and the progesterone inhibited it. I mention this mainly because of Dr. Hundley's interest in it. I do not consider it very important because I belong to the mechanical school.

All of these other things give rise to stasis quite frequently—in 65% of uterine myomas, in 80% of ovarian cysts and so on. We've already talked about carcinoma of the cervix and irradiation therapy. Radical operation for carcinoma of the cervix originated many years ago. Dr. Ernst Wertheim is given credit, but actually three people—Dr. John Clark, who at that time was at Johns

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

ECAUSE ENHANCES HE BODY'S OWN ECHANISMS OR REDUCING LOOD PRESSURE

mild moderate hypertension: Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.

References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

Hopkins and later went to Philadelphia and two other doctors, one named David Meredith Reese and one named Theodor Rumpf, did this operation before Wertheim and Wertheim gave them full credit.

But in those days Wertheim himself found 49 ureteral injuries in his first 500 cases, or 10%. Approximately the same figure, between 9% and 10%, was reported a few years ago by Dr. Joe Meigs and one of his associates from Boston.

Ureteral stricture, acquired, I put in because I think some of these gynecologic lesions cause

Fig 5

these acquired strictures. And I put in nephroptosis because that occurs about five times as frequently in females as it does in males, probably because of the great change in fat distribution associated with pregnancy and the termination of pregnancy.

Now we'll go along to some illustrations of some of these conditions. Figure 5 shows a typical hydro-ureteronephrosis of pregnancy. Here we see that it is greater on the right side than it is on the left, which is perfectly typical, and that the dilatation stops at the pelvic brim, the point at which the ureters would be compressed by the

Fig 6

pregnant uterus. That is the reason I feel the mechanical factor is the more important one.

In Figure 6 is a seventeen-year-old girl with an ovarian cyst. The dilatation is very similar to that

Fig 7

Fig 8

of pregnancy dilatation and of course an ovarian cyst is very much the same consistency as a pregnancy.

Fig 9

In Figure 7 you see a patient with a myomatous uterus as large as a term pregnancy. You can see the large soft tissue shadow. The right side is essentially normal, but there is marked dilatation and tortuosity on the left side and the bladder is compressed.

This patient's right ureter was probably in a crevice between two myomatous nodules, but on the left side she had a large intraligamentous nodule which had compressed the ureter and therefore caused this dilatation. Following delivery it takes about six weeks for the dilatation to subside, for complete involution to take place. I think

Fig 10

that is where the hormonal effect comes in, because this (Fig 8) shows postoperative pyelograms on this patient within ten days after operation and there is complete involution.

These next two cases, I think, illustrate the effect of pelvic inflammatory disease on ureters and the production of ureteral stricture. Figure 9 shows a patient with a fibroid, soft tissue shadow coming up about to the pelvic brim, very marked dilatation on both sides, and very poor function on the left side. You can hardly see any visualization on the left side. At operation this patient was found to have fibroids plus a large tubo-ovarian

Fig 11

abscess on the left side. Postoperatively she was studied by retrograde pyelograms.

This (Fig 10) is the right side, where there

Fig 12

had been little if any inflammation and there is almost complete involution. This is a pretty normal looking tract. Figure 11 shows the left side where the tubo-ovarian abscess had been. This is a typical picture of an advanced chronic pyelonephritis, with greatly dilated blunted calyces, very thin cortex and a marked stricture in the lower left ureter.

The next three slides are very similar to these, but have a different basis.

This (Fig 12) was a young girl only 19 years of age who had a large pelvic abscess which I think was probably a pseudopelvic abscess—that

Fig 13

is, instead of being a true abscess just walled off by intestines, it was probably a left-sided tubo-ovarian abscess which had prolapsed into the cul-de-sac. I say this because the follow-up studies on her again show pretty normal involution on the right side (Fig 13) and a stricture of the lower left ureter with continued dilatation of the pelvis, calyces and ureter above the point of constricture (Fig 14).

Figures 15 and 16 show retrograde pyelograms on a patient who had a complete prolapse of the uterus. Here the dilatation comes much further

Fig 14

down. You can see it better on the left side. The lower dilatation occurs because the constriction from prolapse is due to the angulation and turning

Fig 15

back of the lower ureters under the prolapsed uterine vessels.

We made postoperative studies of this patient, but I did not reproduce them because they showed no change. We feel that the reason there was no change was because this patient did have a chronic urinary tract infection, and in chronic infection the tissues lose their elasticity and their ability to undergo involution. When the dilatation of pregnancy was more frequent and more difficult to control than it is now (and sometimes these individuals during pregnancy were infected for a long time), we used to get persistence of the pregnancy

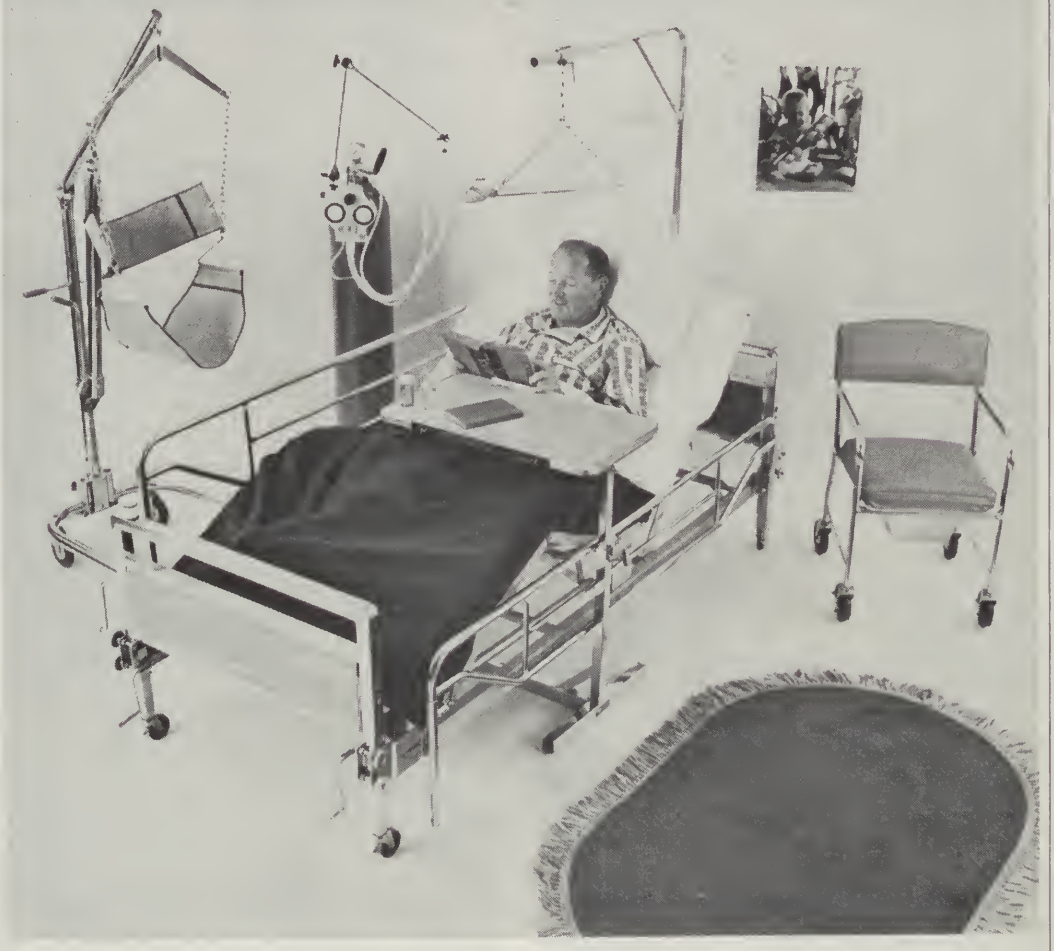

Fig 16

dilatation permanently. And we still see that every now and then.

So, to summarize, I may say that I agree thoroughly with Dr. Fetter that obstructive lesions, or stases, are most important factors in the causation and the maintenance of urinary tract infection; that I do not think the presence of temporary infection in the bladder following catheters is of great importance; and that the great gadgetry that has developed as a result of this has been entirely overemphasized.

CARCINOMA OF THE VOCAL CORD

JERRIE CHERRY, MD
Assistant Professor, Division of Otolaryngology

J. STEWART LOTT, MD
Associate Professor in Radiology

R. ROBINSON BAKER, MD
Assistant Professor, Department of Surgery
The Johns Hopkins University School of Medicine

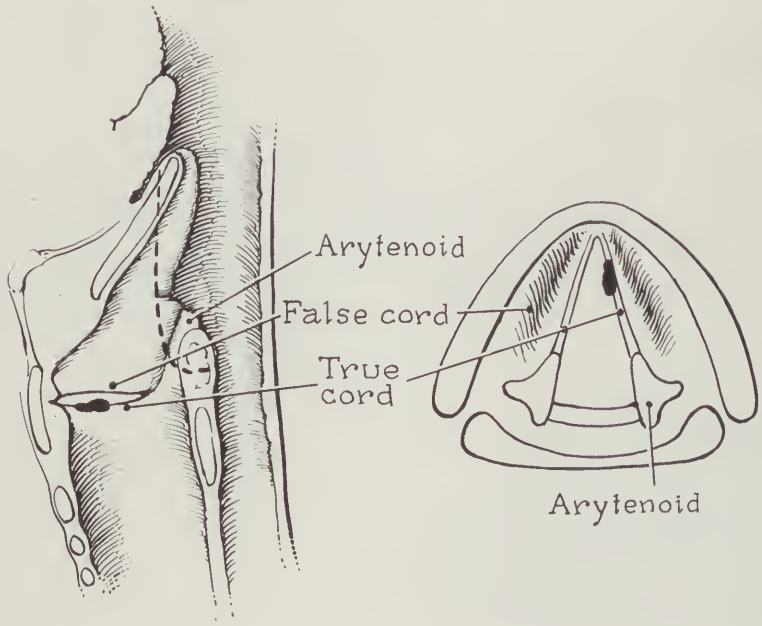
Cancer of the larynx occurs most often on the true vocal cords in males with a history of smoking. This cancer indicates its presence early by hoarseness, and the diagnosis is established by laryngoscopy and biopsy. Ninety per cent of these early true vocal cord lesions can be cured by either radiotherapy or surgery.

Any patient with voice change persisting longer than three weeks should have a direct laryngoscopy to establish the diagnosis.

The incidence of cancer of the larynx in the general population is about 3 per 100,000, with 70% of these cancers beginning on the true vocal cords. If diagnosed early, they offer an excellent chance of cure, 90%

Laryngeal cancer occurs nine times more frequently in men than in women and is seen most often in smokers of long standing.

As laryngeal cancer occurs so often on the true vocal cords, it makes its presence known by voice changes relatively early in the disease. At first this voice change may be an intermittent huskiness, as the true vocal cords overcome the mechanical obstruction to their complete closure for short periods of time. As the tumor mass enlarges or as peritumor inflammatory reaction continues, the voice becomes constantly hoarse or husky. Patients rarely seek medical aid prior to persistent voice change, in part explaining the usual 10-month delay from onset of symptoms to diagnosis.



The true vocal cord is a tendonous band extending medially from the vocalis muscle and it is covered by a thin mucosa containing a meager lymphatic system. Thus, early or rapid spread of cancer within the larynx or beyond the larynx is seldom a feature of true vocal cord carcinoma.

Pain is seldom associated with this lesion, although the patient may cough, complain of vocal fatigue, and make frequent efforts to clear his throat. Swallowing is invariably normal, as a true vocal cord lesion is within the larynx. True cord cancers may occur anywhere on the vocal cord, but the free edge of the anterior third is the most common location.

The diagnosis of laryngeal cancer is made upon inspection of the larynx and confirmed by biopsy. As the larynx is hidden from view, it is impossible to make an accurate appraisal of laryngeal disorders without laryngoscopy. The importance of direct laryngoscopy to adequately assess the extent of the disease cannot be overemphasized.

Small true vocal cord lesions (Fig) have a gray to pink granular texture, as opposed to the smooth white glistening normal mucosa of the vocal cords. Vocal cord mobility is normal with true cord cancers, becoming immobile only with advanced lesions. Early lesions of the true cord seldom present with cervical node metastases.

Anatomy of the endolarynx. A small lesion is present on the anterior one-third of the right cord.

Solitary vocal cord cancers are treated with about equal success by surgical excision of the involved vocal cord or by radiotherapy. Each has certain advantages which would dictate its choice in each case. The main advantage of irradiation over surgical excision is a more normal voice after therapy. The inherent disadvantage of irradiation is the effect of 5,000 rads to the larynx and adjacent tissues. Partial excision of a vocal cord results in varying degrees of hoarseness, but surgical excision has three advantages over irradiation: 1) large doses of irradiation are avoided; 2) the extent of disease is accurately determined at operation; 3) the proof of adequate excision can be demonstrated by histologic section. Irradiation seems indicated in older patients and in patients whose voice is important for occupational or social reasons. Surgical excision moy be preferable in younger patients whose life expectancy is such that large doses of carcinogenic irradiation are contraindicated.

Patients treated by either means should be seen at regular intervals for the rest of their lives. Second primary lesions within the larynx are common, and bronchogenic carcinoma has been shown to develop in a high percentage of patients with laryngeal cancer.

"CLEAR THE TRACT" WITH

Coughing ahead...
Clear the Respiratory Tract with Robitussin.

Much more than just a slogan, "clear the tract" reflects the dependable antitussive-expectorant action of the three Robitussin formulations. All contain glyceryl guaiacolate, the time-tested expectorant that greatly enhances the output of lower respiratory tract fluid. Increased RTF volume exerts a demulcent effect on the tracheobronchial mucosa, promotes ciliary action, and makes thick, inspissated mucus less viscid and easier to raise. Glyceryl guaiacolate is safe, non-narcotic, and almost universally accepted by patients of all ages.

How long will it take her to recover from her hip fracture if she just doesn't care?

Does she really care? Is she alert, encouraged, positive and optimistic about getting completely well soon?

Or has she given in to the demoralizing impact of confinement, disability and dependency?

When functional fatigue complicates convalescence, Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that can often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

THE DEMOGRAPHY OF MENTAL ILLNESS IN MARYLAND

KURT GORWITZ
Statistics Director
State of Maryland Department of Mental Hygiene

Enumeration of the mentally ill in the United States was first attempted in 1840. U.S. marshals accumulated the data, each according to his own undefined methods, and results were wholly unreliable. At that time, half a dozen state-operated mental hospitals and a number of private mental institutions were in existence, but most of the mentally ill were still housed in jails, almshouses and other public facilities. In the intervening 125 years, both enumeration procedures and care facilities have been vastly improved, primarily at the State level. Maryland, world-wide leader in the statistical area, has reliable data from its Psychiatric Case Register on which to base answers to many questions now asked about the extent and treatment of mental illness. Questions and answers are presented here.

Efforts to count and analyze the segment of our population considered to be mentally ill originated in this country about 150 years ago. On a federal level, the first attempt at enumeration was made in 1840. The U.S. Census Bureau had not yet been established and the local marshals had the responsibility for conducting the census. One of the questions sought to determine the number of what were called "insane or idiots" in their area. No effort was made to divide these groups and no definitions were provided. Each marshal was, in effect, free to include or exclude as he saw fit.

The official records indicate that a total of 17,434 such people were enumerated. Of these, 528 were Maryland residents. Both in this state and in the rest of the country, this was equal to a rate of slightly more than ten per 10,000 total population; however, there were wide variations reported within states and between states. It is therefore not surprising that in 1843 the American Statistical Association deemed it necessary to send a formal letter to the U.S. House of Representatives protesting the accuracy of the 1840 census. The letter singled out the data on "insane and idiots" as being particularly unreliable.

This census reported a higher rate of insanity among free Negroes than among slaves. Despite the gross inaccuracy of these statistics, the data were subsequently stated, in the U.S. Congress, to be one justification for the retention of slavery.

In 1850, the enumeration was repeated, but separate counts were obtained for those considered to be "insane" and those considered to be "idiots." The official report indicated that roughly six out of every 10,000 residents were insane and an equivalent number were idiots. Maryland's

Based on a talk presented at the Phipps Psychiatric Unit of the Johns Hopkins Hospital, November 4, 1964, and on a paper given at the annual meeting of the American Association for the Advancement of Science, December 27, 1965.

reported rate for idiots was similar to the national figure. The rate of insane, however, was reported to be substantially higher, a fact which caused speculation as to whether this reflected greater mental illness here or merely differences in reporting.

Similar data were collected in each census from 1860 to 1890. The enumeration was discontinued in 1900 because it was felt that accurate information was not obtainable. No nationwide attempts have been made since 1890 to enumerate the mentally ill.

In 1880 the data obtained by the census enumerators were supplemented by written inquiry of physicians and of facilities for the mentally ill and the mentally retarded. Data on 17% of the enumerated insane were obtained solely through responses from physicians. As a result of this endeavor, rates in this census were considerably higher than those reported in earlier and subsequent enumerations. In Maryland, for example, the rates of mental illness and mental retardation were stated to be 198.6 and 141.1 (per 100,000 population), respectively.

A comparison with current estimates, however, shows that these reported rates were still very low and indicates substantial under-enumeration, particularly among the borderline retardates and the non-psychotic types of mental disturbances. According to latest available data, more than one percent of Maryland's total population are under care of a psychiatric inpatient or outpatient facility at some time during a one-year period. Many others are believed to receive supportive services for mental disturbances through private practice, and nonpsychiatric agencies and programs. Currently accepted estimates are that one-half of one percent of the population are severely retarded, with an additional two and one-half percent more moderately retarded. In Maryland, 0.7 percent of the population attend public school classes for the educable and trainable retarded, with an additional 0.3 percent in hospital and community facilities.

In 1773 the first public mental hospital was established in Williamsburg, Virginia. It is interesting to note that a general hospital in Philadelphia accepted mental patients from its inception in 1752. The first private mental hospital (The Friends Retreat in Pennsylvania) opened shortly after this. Both were founded largely as a result of the Quakers' efforts. By the time of the 1840 census half a dozen state-operated facilities and a number of private hospitals were in existence. One of these was the predecessor of the Seton Institute in Baltimore. Another was Maryland's first state-operated hospital for the insane, the Maryland Hospital, which began accepting mental patients in 1797 as part of a general hospital program. It was located in Baltimore in the Johns Hopkins Hospital area and, intermittently, privately and publicly operated. Its program was limited to the care of the mentally ill by legislative action in 1839. It moved to what is now the Catonsville area in the 1850s when it became known as the Spring Grove State Hospital. Some of these facilities maintained patient statistics from their inception and Goldhamer and Marshall analyzed some of this information in the book, "Psychosis and Civilization."

Most mentally ill, however, continued to be kept in jails, alms houses and other public institutions, often under the most inhuman conditions imaginable. The Sylvan Retreat, a county-operated mental hospital in Cumberland, still has in its basement the dungeons which at one time were used to hold "unruly" patients. A visit with her Sunday School pupils to the House of Correction in East Cambridge, Massachusetts, in 1841 changed the life of a remarkable and largely forgotten woman named Dorothea Lynde Dix. She devoted her remaining years to a crusade on behalf of the mentally ill which carried her to every part of this country and to much of Europe. In Maryland, as in many other states, she addressed a joint session of the legislature. In 1854 she induced the U.S. Congress to adopt a bill which provided that proceeds from the sale of 12 million acres of public lands be used for the care of the mentally ill. If this bill had not been vetoed by President Pierce, mental health programs in Maryland and other states would undoubtedly have been drastically changed.

In general, statewide mental health programs were not formally organized until much later. In Maryland, for example, the State Lunacy Commission which preceded the Mental Hygiene Department was not established until 1886. Maryland's second hospital for the mentally ill, the Springfield State Hospital at Sykesville, was founded shortly after this date. In New York State, care of the mentally ill remained the legal

SKIN PROBLEMS

responsibility of the county poor houses until about the same time. In many states, the assumption of state responsibility for the treatment of the mentally ill was preceded by acrimonious legislative debate instigated by representatives of those with a vested interest in maintaining the bulk of the mentally ill in county homes.

Until the establishment of a state mental health authority, statistics, if available, were generally limited to specific individual facilities. In most states where centralized mental health statistics programs were ultimately established, these data served administrative purposes and were concerned primarily with measuring the flow of patients into and out of publicly operated psychiatric hospitals and in describing some of the demographic characteristics of this population. In more recent years, with the development and rapid growth of psychiatric clinics and other outpatient programs, statistical services increasingly have been concerned also with comparable data for these facilities. In Maryland and most other states, statewide data on treated mental illness are therefore of recent origin.

Statistical data of most states continue to be limited to state-operated and state-supported hospitals and clinics. Since they generally exclude federal (VA) and privately operated mental health facilities, they usually cannot provide any indication as to the total amount of psychiatric services provided. In addition, because of the lack of a ready mechanism for eliminating the duplication of multiple treatment services, these data cannot be used to study rates of treated mental illnesses, variations in treatment rates and modalities for different population segments, and the relationship of these rates to socio-economic variables and other public health indices. Community investigations, such as the recent Midtown Manhattan study, while being more comprehensive, similarly suffer from a lack of longitudinal data regarding the course of the illness, and of the sequence and extent of services provided for the condition.

The limitations of these types of statistical programs should be particularly clear if we take cognizance of the rapid growth in recent years in the number and variety of psychiatric facilities and in the coordination of their services. This expansion, together with the current emphasis on short-term intensive treatment, during the acute

stages of illness, followed by continuing supportive services, has produced an increasing number of individuals who receive multiple treatment services during a given time period—often in different facilities.

Maryland has attempted to overcome some of the deficiencies indicated here through the development of a psychiatric case register based on unified reporting from nearly all public and private inpatient and outpatient psychiatric facilities. The concept of case registers is not new. They have been established and maintained in the United States and in other countries for many years in such other public health fields as tuberculosis, venereal diseases, rheumatic fever and cancer. Usually, they consist of an up-to-date alphabetic listing of all individuals known to have had the illness at some time, together with demographic information and a sequential record of the services received for this condition. While these registers can be an important research tool, it should be clear that they cannot be used for the computation of true incidence or prevalence rates since an undetermined number of cases would not be known to any of the register sources.

The Maryland Psychiatric Case Register, a research project administered by the Department of Mental Hygiene in cooperation with the National Institute of Mental Health, has been in existence since July 1, 1961. It is based on reports of all admissions and terminations submitted by more than 130 psychiatric facilities which are estimated to treat in excess of 98% of all such patients. It encompasses the entire state, with its population of three and one-half million people, and is the largest operational register of its type in the world at the present time. In the United States, the next largest register is in Monroe County, New York, and serves a population of approximately 600,000. The confidentiality of all register information is protected in Maryland by a state statute adopted in 1963 which legally safeguards data collected for health research purposes.

WHAT IS THE CURRENT EXTENT OF MENTAL ILLNESS IN MARYLAND? We do not have the answers to this question since this would require some type of community investigation. Because of the Maryland Psychiatric Case Register, however, we do have some information regarding the extent of treated mental illness. The following are the answers to some basic ques-

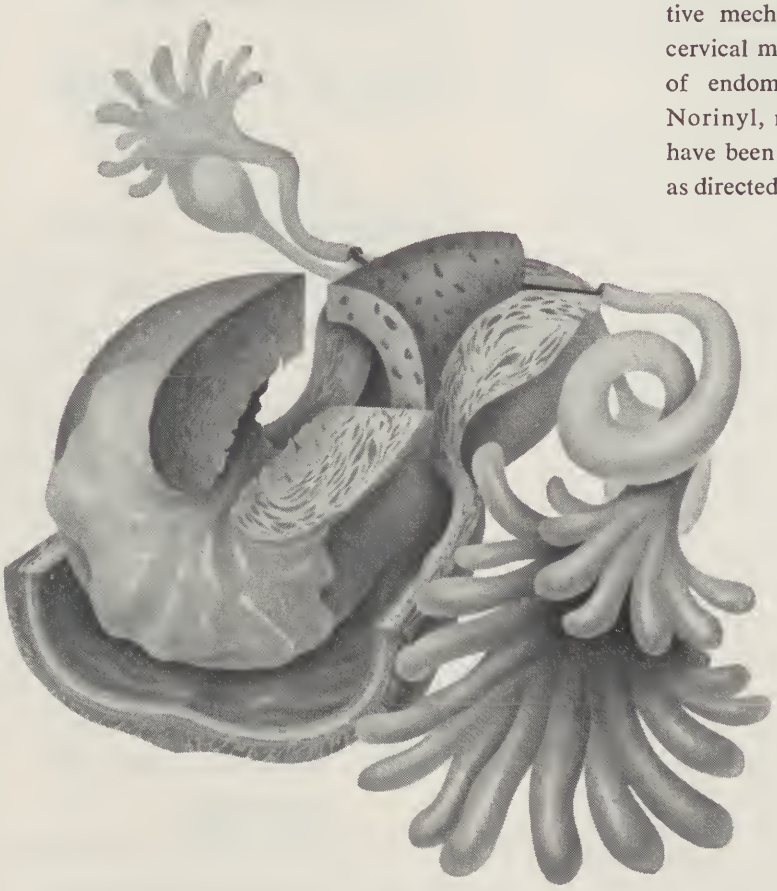
Norinyl® tablets



(norethindrone 2 mg. ± mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.

plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

for multiple contraceptive action

tions. It should be kept in mind that all figures mentioned here are based on unduplicated counts of individuals:

1. How many people are treated in psychiatric facilities? Latest available data indicate that more than 35,000, or one percent, of Maryland's residents receive treatment in a psychiatric facility at some time during a one-year period. This rate has increased in recent years, both because of the expanding numbers under care in public and private mental hospitals and because of the opening of a number of clinics and other outpatient facilities. The number treated in general hospitals, while proportionally still quite small, has also increased. In the last five years, nearly 80,000 Maryland residents (or nearly 2½% of the state's population) have been reported to the register as under treatment.

2. How does this vary by age and sex? Age-specific rates have been consistently higher for males than for females. This disparity has been accounted for primarily by a five to one male-female ratio among patients diagnosed as alcoholics. Excluding this group, more females than males were under psychiatric care in most age and diagnostic cohorts. The maximum proportion of the population under care (nearly two percent) has been in the age group 65 and over. Much of this has been accounted for by long term, custodial patients who occupy one out of six beds in the state mental hospitals. The number of older patients in outpatient facilities has remained minimal. Among admissions, however, the highest rate has been in the age group 35 to 44 (0.8 percent per year).

3. Do rates differ in Baltimore City and in the rest of the state? Baltimore City rates for specific age and sex groups are, in general, substantially higher than comparable rates in the Maryland counties. Total prevalence rates are approximately twice as high in Baltimore City, a reflection of socio-economic factors, selective in-and-out migration and the greater availability of psychiatric services. It should be noted, however, that major variations are reported within Baltimor City; that is, admission and under-treatment rates for many types of mental illnesses are related to income and other economic variables and generally follow a pattern similar to other public health indices.

4. How do white and nonwhite rates differ? A comparison of white and nonwhite rates should be approached with caution since it is known that they are distorted by the fact that the socio-economic composition of the two groups differs significantly and that there may be selective use of other available resources such as private psychiatrists.

Nonwhite admission rates to all psychiatric facilities are substantially higher than comparable white rates. This difference is particularly pronounced in the state-operated hospitals where nonwhite rates are nearly twice as high as white rates. They are also somewhat larger in outpatient facilities. However, there are almost no nonwhite admissions to private hospitals, although these accounted for 15% of all white admissions.

Similar variations have been reported from other areas where comparable data are available. They provide one indication of the cost to the total community resulting from the social, cultural and economic deprivation and disorganization of Negroes in the inner core slums of America's cities.

5. How many alcoholics are treated in psychiatric facilities? The number of patients with a primary diagnosis of alcoholism is expected to exceed 6,000 during the current fiscal year. Alcoholism in many cases is one of the manifestations of psychiatric disorders. We can therefore anticipate, based on data from earlier years, that at least 2,000 patients with other diagnoses will also have major drinking problems. While some of the large increase observed in recent years in the above is due to the development and expansion of outpatient programs for alcoholics, most of it is due to the rise in these admissions to the state-operated hospitals. Latest data indicate that two-thirds of all admissions with a diagnosis of alcoholism are to one of the state mental hospitals, and that these now account for more than 40% of all patients entering these facilities.

Register data indicate that rates are highest between 45 and 54 years and that proportionally twice as many Negroes as Whites are under treatment for alcoholism during a given year (white male, 255 per 100,000 estimated population; nonwhite male, 429; white female, 75, nonwhite female, 137). This ratio is accounted

for by a large disparity up to age 45, after which point white and nonwhite rates are nearly equal. Whether or not this is related to sociocultural variations, legal factors, or to the availability of alternative resources, is not known. Similarly, undertreatment rates for specific age, sex and race groups in Baltimore City are substantially and consistently higher than in the Maryland counties.

While the total number of alcoholics in Maryland is not known, it is estimated at nearly 100,000. This would indicate that only a small proportion are receiving treatment in psychiatric facilities. Even these often receive only minimal services. In the three major state hospitals, one-tenth of alcoholics are released within one week, half within one month and almost all within one year. Available data indicate that 18 months after onset of hospitalization, 79% of alcoholics are not under psychiatric care, 5% are dead, and the remaining 16% on hospital or clinic rolls.

6. How many schizophrenics are treated in psychiatric facilities? The number of patients with a diagnosis of schizophrenia has remained almost constant since 1961, at approximately 6,400 (0.2% of Maryland's population). In the last five years, 17,000 residents have been reported to the Register as schizophrenics during one or more treatment episodes. Rates have been slightly higher for females than for males and much higher for nonwhites than for whites. The highest rates, however, are reported for separated white males between 35 and 44 years of age (more than two percent). Paranoiacs, accounting for one-third of all schizophrenic admissions, are the largest subgroup.

Many individuals receive more than one diagnosis in the course of their illness. Among admissions diagnosed as schizophrenic during the three-year period from July 1, 1961, to June, 1964, 9% were diagnosed as alcoholic during a previous or subsequent treatment episode, 6% as manic depressive or suffering from some other type of psychotic disorder, and 30% of the group as having other mental disorders.

7. How long do patients remain hospitalized in state-operated facilities and what is the probability of rehospitalization? Of the patients 25 to 54 years of age admitted to Crownsville, Springfield and Spring Grove, more than half were released within three months and more than 80% within a year. Less than one out of every twenty remained hospitalized at the end of two years. Of those released within one year, 42% were rehospitalized within the next 18 months. Psychotic patients had the lowest release rates and the highest readmission rates. Alcoholics had the highest release rates. The percentage distribution of all patients 18 months after original admission was as follows: hospitalized continuously, 5%; released and rehospitalized, 9%; on hospital leave, 9%; on clinic rolls, 10%; dead, 3%; alive and not under psychiatric care, 64%.

8. Does the life expectancy of the mentally ill differ from that of the general population? Preliminary data indicate that the life expectancy of the mentally ill is lower than the comparable general population figure. A study among patients admitted to Maryland's three major psychiatric hospitals indicated high mortality rates, both during hospitalization and after release. Among alcoholics, death rates were up to nine times as high as rates in the general population of the same age and sex. Mortality rates were also substantially higher among the psychotic and psychoneurotic. While deaths from suicide were proportionately more frequent among the mentally ill, particularly the psychoneurotic, they accounted for only a portion of the disparity. Lower than average socio-economic status and greater concomitant physical illnesses are believed to be other factors related to these differences.

9. How do Maryland rates compare with those of other states? Comparisons with other states are not possible since similar statistics are not available elsewhere on a statewide basis. Data for public mental hospitals alone indicate that, proportionately, Maryland has fewer mental hospital beds but a greater turnover in the patient population. The greater admission and release rates in Maryland are accounted for, in part, by alcoholics receiving short-term treatment. A number of other states do not accept such patients in their state mental hospitals.

10. Do these data provide any indication of possible future trends? Register data indicate that while the number of Maryland residents treated in psychiatric facilities has increased, they still comprise only a small proportion of the state's population. Recent community investi-

gations, such as the Midtown Manhattan study, have reported that approximately one in every five persons shows major symptoms of mental disturbance. The application of these data to Maryland indicates that many residents with mental illness either are untreated or receive supportive services through non-psychiatric agencies and resources, and that the currently planned expansion of outpatient facilities in the state, and the development of new community-centered programs, may not reduce the flow of patients to the state mental hospitals. Rather, they may result in an expanding total patient load, the provision of services to many population segments previously untreated, and the improvement of patient care through the development and application of new treatment concepts and the coordination of services.

2100 Guilford Ave
Baltimore, Md 21218

vignettes of angina pectoris—
no. 1 in a series:

angina and the surgeon

John Hunter—
British surgeon (1728-1793)

angina of anger

"My life is in the hands of any rascal who chooses to annoy and tease me."[1] So said the great British surgeon and anatomist, John Hunter, realizing that he could not control the anger which precipitated frequent and severe attacks of angina pectoris. According to Mettler: "His statement was no exaggeration. On October 16, 1793, he attended a meeting of the St. George's hospital staff, and, while defending the interests of several students, he was contradicted and thoroughly antagonized. The pains of angina commenced, he started toward another room, gained it, and fell dying into the arms of a physician."[2]

Why Edward Jenner withheld his paper on angina In 1777, at an earlier stage of the condition, Hunter's angina alarmed a favorite pupil, Edward Jenner, who wrote to Dr. Heberden that he feared his teacher was "affected with symptoms of the Angina Pectoris."[3] So concerned was Jenner about his former teacher's emotion-related condition that he deliberately cancelled publication of a paper on angina pectoris, fearing that Hunter would read it, and hav "his fears excited by its truly formidable nature."[4]

Severity of angina described Hunter's brother-in-law, Dr. Everard Home, who witnessed death and performed an autop gave this account of the later s of the condition:

"...the pain became excruciat at the apex of the heart; the th was so sore as not to allow of a attempt to swallow anything a the left arm could not bear to be touched....

"The affections above describe were, in the beginning, readily brought on by exercise... but t at last seized him when lying in bed, and in his sleep...."[5]

in the modern management of angina pectoris

Peritrate® SA

Sustained Action (pentaerythritol tetranitrate) 80 mg.

Each double-layer, biconvex, dark green/light green tablet of Peritrate SA Sustained Action contains:
pentaerythritol tetranitrate . . . . . 80 mg.
(20 mg. in immediate release layer and 60 mg. in sustained release base)

Peritrate (pentaerythritol tetranitrate) is a nitric acid ester of a tetrahydric alcohol (pentaerythritol).

Actions: The exact cause of angina pectoris (that is, the pain associated with coronary artery disease) remains obscure, despite the numerous and often conflicting hypotheses concerning its pathophysiology. Therapy at the present time, therefore, remains essentially empiric. Customarily, clinical improvement has been measured by: reduction in (1) number, intensity and duration of angina pectoris attacks and (2) necessity for glyceryl trinitrate intake for prevention or relief of anginal attacks.

Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg. has been reported in clinical usage to reduce in number and severity the incidence of angina pectoris attacks, with concomitant reduction in glyceryl trinitrate intake.

In the evaluation of Peritrate (pentaerythritol tetranitrate) and Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg. in angina pectoris, clinical improvement has been customarily measured subjectively by reduction in number and severity of attacks and necessity for glyceryl trinitrate intake for prevention or abortion of anginal attacks. Individual patterns of angina pectoris differ widely as does the symptomatic response to antianginal agents such as pentaerythritol tetranitrate. The published literature contains both favorable and unfavorable clinical reports. In conjunction with total management of the patient with angina pectoris, Peritrate (pentaerythritol tetranitrate) and Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg. have been accepted as safe for prolonged administration and widely regarded as useful.

Animal pharmacology: In a series of carefully designed studies in pigs, Peritrate (pentaerythritol tetranitrate) was administered for 48 hours before an artificially induced occlusion of a major artery and for seven days thereafter. The pigs were sacrificed at various intervals for periods up to six weeks. The result showed a significantly larger number of survivors in the drug-treated group. Damage to myocardial tissue in the drug-treated survivors was less extensive than in the untreated group. Pigs rather than dogs were used because their coronary artery distribution more closely resembles that of human beings. Studies in dogs subject to oligemic shock through progressive bleeding have demonstrated that Peritrate (pentaerythritol tetranitrate) is vasoactive at the postarteriolar level, producing increased blood flow and better tissue perfusion. These animal experiments cannot be translated to human behavior

Indications: Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg. is indicated for the relief of angina pectoris (pain associated with coronary artery disease). It is not intended to abort the acute anginal episode but is widely regarded as useful in the prophylactic treatment of angina pectoris.

Contraindications: Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg. is contraindicated in patients who have a history of sensitivity to the drug.

Warning: Data supporting the use of Peritrate (pentaerythritol tetranitrate) during the early days of the acute phase of myocardial infarction (the period during which clinical and laboratory findings are unstable) are insufficient to establish safety.

Precautions: Should be used with caution in patients who have glaucoma.

Adverse reactions: Side effects reported to date have been predominantly related to headache (which may require discontinuation of medication) and gastrointestinal distress which are usually transient with continuation of medication.

Dosage: Peritrate SA Sustained Action (pentaerythritol tetranitrate) 80 mg., 1 tablet immediately on arising and 1 tablet 12 hours later (on an empty stomach).

Additional dosage forms
Peritrate (pentaerythritol tetranitrate)—10 mg. and 20 mg. tablets with or without phenobarbital.

Peritrate with Phenobarbital SA Sustained Action—80 mg. pentaerythritol tetranitrate and 45 mg. phenobarbital.

(**Warning:** Tablets containing phenobarbital may be habit forming.)

MEDICAL AND LEGAL ASPECTS OF HUMAN STERILIZATION

JOHN WHITRIDGE, JR., MD
Associate Professor of Gynecology and Obstetrics, The Johns Hopkins University School of Medicine

RANDALL C. COLEMAN
of the Baltimore Bar

Proposed legislation for compulsory sterilization of humans in certain circumstances would not accomplish the objectives of its proponents, and is both medically and legally unnecessary. Indeed, it may even be restrictive to a point of being more harmful than beneficial. The expense of such a program would be prohibitive, although its positive effects would be only minimal.

From time to time, legislation has been introduced in the Maryland General Assembly relating to surgical sterilization of humans. Currently the Maryland law is silent on this subject, there being no statutes whatever relating to it. In addition, there has recently been considerable interest in and discussion of national legislation on both sterilization and abortion. Volumes have been written on this topic, many aspects of which are highly controversial. Religious and moral issues are particularly involved. We will confine ourselves largely to the medical and legal aspects of human sterilization, however, so that the profession and the public alike may better understand what is at stake.

The expressed objectives of those Maryland legislators who have recently sponsored this type of legislation are five in number. First, sterilization is a desirable and effective method of population control. Second, sterilization would be effective in controlling the number of children born to unmarried women. Third, if sterilization were given legal status, physicians generally would be less reluctant to carry out the procedure. Fourth, legislation would enable the courts to order compulsory sterilization of individuals with certain types of hereditary forms of mental illness, mental deficiency, etc. Fifth and last, an adequate law on sterilization would tend to discourage one marital partner from the sterilization procedure without the consent and knowledge of the other partner.

The first two of these objectives are largely medical in nature. The fourth is a combination of medical and legal considerations, and the remaining two principally involve legal aspects.

Prior to discussion of details, it should be noted that this subject was reviewed in July, 1963, by an ad hoc committee of the Medical and Chirurgical Faculty of the State of Maryland, under the chairmanship of Richard W. TeLinde, MD, professor emeritus of Gynecology, The Johns Hopkins University School of Medicine. The committee decided to "go on record as seeing no need for any law regarding the sterilization of incompetent persons," and reported the following conclusions: "In summary, it was the general feeling of the committee members that no legislation pertaining to sterilization of humans is needed in Maryland at the present time. Adequate

procedures are now available to accomplish sterilization, and any legislative act might tend to severely limit the procedure."

Medical Aspects

Termination of the ability of humans to reproduce can be accomplished in a variety of ways. The most common procedure in females is tubal ligation, whereby the continuity of the fallopian tube is interrupted, and the union of spermatozoa and ovum thus prevented. Hysterectomy and several other surgical procedures on females also effectively prevent further childbearing. In the male, the usual procedure is vasectomy, whereby the male is rendered sterile but not impotent. Both tubal ligation and vasectomy are usually considered irreversible; that is, the result must be generally regarded as a permanent one, although it is technically possible to restore the continuity of the fallopian tubes or vas deferens.

From the medical viewpoint, it is important to bear in mind that tubal ligation is not a completely innocuous procedure. In 1955, Eastman and Prystowski, reporting from The Johns Hopkins Hospital,[1] presented data on 1,830 consecutive tubal sterilization procedures. Three women died as a direct result of the operative procedure, with a resulting mortality rate of 1 per 600 procedures. This is not surprising, since the performance of tubal ligation requires entering the abdominal cavity and the administration of anesthesia. Admittedly the risk is slight, but it is nonetheless present.

In the proposed laws introduced in recent years, the procedures specifically to be made legal were limited to salpingectomy and vasectomy. Salpingectomy, by definition, is "complete removal of the fallopian tube" and such legislation would therefore raise doubts as to the legality of the most common and the safer procedure of tubal ligation. The legislation, as introduced and as existing in several other states (eg, Virginia), also requires a thirty-day waiting period between the time written permission is given for sterilization and its performance. Such a provision automatically eliminates any opportunity to carry out the procedure under emergency conditions such as an emergency cesarean section, appendectomy, or any other operative procedure requiring an abdominal incision.

1. **Population control.**—It is true that surgical sterilization, if carried out on a wholesale basis, would be a highly effective method of controlling population growth. The major disadvantages to using this approach to lowering the birth rate are two, namely, risk and cost. The risk involved in carrying out tubal ligation on females has already been mentioned. Vasectomy in the male is, however, usually an office procedure and virtually devoid of risk. The question, medically, as it relates to vasectomy is largely one of how acceptable this procedure would be to large numbers of American males.

In regard to sterilization of females, the cost would be prohibitive if sufficient numbers were involved to have any significant impact on the birth rate. Data prepared by the Division of Statistical Research and Records of the State of Maryland Department of Health indicate the following. If a policy were adopted to offer sterilization to every woman in Maryland under the age of thirty who had had three or more children, and if it is assumed that all these women would agree to sterilization, during the first year of such a program 50,000 procedures would be necessary. This would result in reducing the birth rate from approximately 23 to 20 per 1,000 population. If an average minimal cost of $200 is further assumed (this would include hospital bill and physician's fee), the first year's program would cost a total of $10 million. To continue, in subsequent years, sterilizing all women under thirty who had had three or more children, would require about 10,000 procedures annually at a cost of $2 million a year.

In view of the rapid advances that have been made and further developments that can be expected in the field of contraceptive methods, the cost of sterilization versus more wide-spread use of conventional contraceptive methods must be compared. For example, if instead of being sterilized, the 50,000 women noted above could be given oral contraceptives, the total cost in a year would be approximately $600,000 instead of $10 million. Insertion of an intrauterine device would be appreciably less expensive. And there is an additional factor to be re-emphasized, namely, that the results of sterilization are usually permanent. For a variety of reasons, couples or individuals may and do change their minds about the desirability of having more children. One or more living children may die, there may be a remarriage, or

other factors may prompt a woman to desire more children. The advantages of the conventional birth control methods in this respect are obvious.

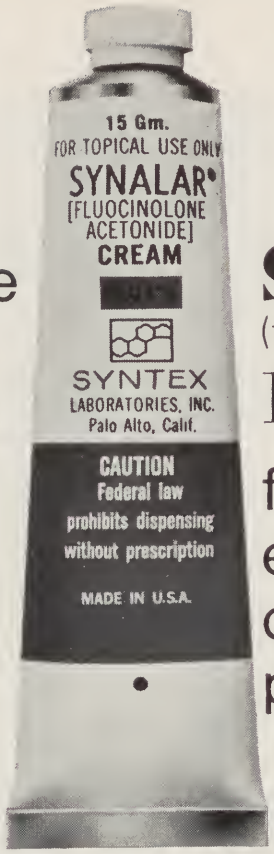
2. Control of out-of-wedlock Births—In 1964, 3,764 births in Maryland counties were recorded as "illegitimate." Of these, 1,845 occurred in women having a first pregnancy and 685 in women having a second pregnancy. This means that 67.2% of all children born to unmarried mothers were the result of either a first or second pregnancy. If, therefore, the usual provision in proposed legislation dealing with compulsory sterilization after a second pregnancy were enacted, slightly less than one-third of the problem, at best, would be solved. Even if so radical a step as carrying out compulsory sterilization of all unmarried mothers after one pregnancy were enforced, this would affect only slightly more than half the problem. Since it is obviously impossible to determine *beforehand* precisely which unmarried girls and women will become pregnant, sterilization does not appear to be a logical means of attacking this growing social, health and moral problem.

This topic cannot be dismissed without reference to the matter of the personal rights of the individual. Since the vast majority of women who have had a pregnancy out of wedlock ultimately marry and raise a family under conventional circumstances, the moral and legal right to carry out compulsory sterilization on these grounds is open to serious question.

3. Compulsory sterilization of Defectives—From the medical viewpoint, the problem of principal concern here is that of determining which conditions are clearly hereditary. There is considerable disagreement among the experts as to the scientific evidence of precise hereditary factors in individual cases of many types of conditions. If the experts cannot agree, will not the courts find it difficult to decide in each individual case whether sterilization is, in fact, in the best interests of the individual and of society? It seems highly likely that the courts of law would find it necessary to establish special review committees or commissions to protect the rights of the individual and to give the courts expert advice on the merits of sterilization in each individual situation.

In the matter of sterilization of the severely mentally retarded, there is the consideration of their fitness to be adequate parents, irrespective of any hereditary factors involved. Even in the absence of a law on sterilization, sterilization of the severely retarded is being carried out by physicians with the written permission of a parent or legal guardian.

Legal Aspects



To what risks, if any, do physicians within the State of Maryland subject themselves by the performance of voluntary human sterilization procedures? There are two possible areas of liability, criminal and tort, which may be broken down roughly as follows:

1. Criminal liability
   a) Mayhem and assault
   b) Public policy
2. Civil liability
   a) Tort
   b) Contract

1. Criminal Liability—At the present time there is no express authorization for, nor restriction upon, the performance of voluntary human sterilization procedures within the State of Maryland. Normally, therefore, there should be no criminal liability since the performance of such an operation is not violative of any statutory restriction. The question of criminal liability is not quite so simple. Nevertheless, we believe the likelihood of a physician's being held criminally liable to be so remote as not to constitute any real threat to him.

There appear to be only two possible crimes which a physician performing a sterilization operation might commit: assault and mayhem. Insofar as assault is concerned, it seems highly unlikely that a court would consider sterilization a criminal assault, especially when the patient has consented. In one reported case, *Taylor v State*,[2] the defendant was charged with an assault with intent to commit an unnatural sexual act (sodomy) to which there was consent by the prosecuting witness, a 15-year old boy. In holding that the consent of the prosecuting witness was not a valid defense, the Court of Appeals relied on the public policy behind a special Maryland juvenile delinquent statute, that the act itself was considered a breach of the public peace and therefore a crime against the public generally. The indication is

new small size

Synalar® 0.01%
(fluocinolone acetonide) **cream**
15 Gm.

for even greater economy in office or hospital practice

the superiority topical with the

Now you can prescribe as little or as much Synalar Cream 0.01% as is needed for a particular therapeutic problem in a size that permits the greatest economy for your patient. The new 15 Gm. tube, for example, is best suited for short-term therapy and for small sites. For more extensive body areas prescribe the 45 Gm. tube—a size that's also ideal for your treatment table. And the 120 Gm. jar is most economical for hospital use. Thus, with Synalar Cream 0.01%, you have the superiority of a modern topical corticosteroid shown to be more effective than 1% hydrocortisone[1-3] plus the economy that makes therapy practical for use in more dermatologic conditions, in long-term maintenance, with occlusive dressings in resistant cases, and in extensive area involvement.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** 1. *General*—Synalar Cream 0.01% is virtually nonsensitizing and nonirritating. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. 2. *Occlusive dressing method*—With occlusion of extensive areas, systemic absorption of the corticosteroid may occur, and suitable precautions should be taken. Occasional patients may show contact sensitivity to a particular dressing material or adhesive. Miliaria, folliculitis, or pyodermas have been seen infrequently with the use of this technique. The development of infection requires appropriate antibacterial therapy and discontinuation of the occlusive dressing method. Local atrophy and striae have been reported with protracted occlusive dressing therapy. While lesion relapses can be expected to occur in many psoriatic patients, remissions may persist for several weeks to several months in favorable cases. The patient whose psoriasis is in an active stage, with recent appearance of new lesions, may not be a good candidate and may show early relapse. Some plastic films may be flammable, and due care should be exercised in their use. Similarly, caution should be employed when such films are used on or left near children to avoid the possibility of accidental suffocation. **Side Effects:** Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. **References:** 1. Cahn, M. M., and Levy, E. J.: J New Drugs 1:262 (Nov.-Dec.) 1961. 2. clear in the decision of the Court of Appeals that the consent of the prosecuting witness would have been a valid defense to the defendant but for these circumstances. It is submitted that there is no likelihood whatever of sterilization being put in the same category as a breach of the public peace or a crime against the public generally.

The crime of **mayhem** should likewise be considered in the same light as assault. A Maryland statute creating a crime similar to mayhem reads as follows:

> "Every person, his aiders, abettors and counsellors, who shall be convicted of the crime of cutting out or disabling the tongue, putting out an eye, slitting the nose, cutting or biting off the nose, ear or lip, or cutting or biting off or disabling any limb or member of any person, of malice aforethought, with intention in so doing to mark or disfigure such person, shall be sentenced to the penitentiary for not less than two nor more than ten years."[3]

The *American Bar Association Journal,* in discussing the relationship between sterilization and the crime of mayhem, although noting that a decision fixing criminal liability might legitimately be reached, nevertheless concluded:

> "Under the provisions of the common law, vasectomy and salpingectomy could hardly constitute mayhem. The elements of 'rendering one less able to defend himself' or to 'fight for the king' or 'less able to earn his own living' are not results of the operations as they are now performed. Unless the courts could find in the common law definitions of the crime of mayhem something to indicate that it was intended to include a prohibition of operations which produced merely an inability to procreate, then there would seem to be no basis for fixing a criminal liability."[4]

The possible violation of the Maryland statute stems from the language prohibiting the disabling of a "member," which would seem to include any organ of the body; but, since laws prohibiting mayhem were historically designed to prohibit any injury rendering the injured party a less effective member of society, human sterilization would hardly fall within the prohibition.

In the realm of public policy, when such policy relates solely to the moral propriety of human sterilization, there is considerable doubt as to whether or not a court is the proper forum for determining that policy. Although courts are routinely called upon to enforce values upon which there is a consensus in the community, the resolution of conflicting views is within the peculiar competence of the legislature.[5]

Courts do frequently, however, usurp the function of the legislature and thus it might be well to examine the present thinking of one court, at least, on the moral propriety of a subject certainly closely related to human sterilization. In the recent case of *Griswold v Connecticut,*[6] the Supreme Court of the United States was concerned with the constitutionality of a Connecticut statute making the use of contraceptives a criminal offense. In holding the statute unconstitutional, the justices were somewhat divided as to their reasons. Some held that it was an unconstitutional invasion of the right of privacy of married persons; others, that it violated the Fourteenth Amendment in failing to protect fundamental personal rights; another, that it deprived married couples of liberty without due process of law, in violation of the Fourteenth Amendment; still another, that it violated basic values in the concept of ordered liberty. Two justices dissented; they felt that the statute violated no constitutional provisions, and stressed that there is no constitutional right of privacy.

As a matter of pure law, much is to be said for the dissenting opinion, although we feel the result reached (be it judicial legislation or otherwise) was infinitely desirable. The point, however, is that nowhere, in any of the many opinions written in a controversial case, has there been any suggestion whatever that the use of contraceptives, per se, violates public policy.

In the only reported case dealing with elective sterilization, *Shaheen v Knight,*[7] the court refused to hold that there was any public policy against such an operation on the ground that there was "no virtual unanimity of opinion regarding sterilization."[8]

2. Civil Liability—When the patient has consented to sterilization, the modern view is that such consent constitutes an absolute bar in a **tort** action for injuries resulting therefrom. Although there is conflict among authorities on the point, we are persuaded to the view that it would be un-

conscionable to allow a tort recovery in the face of the patient's consent. The matter is discussed in two law review articles, each bearing the caption *Consent to Operative Procedures.*[9]

In the fairly recent Virginia case of *Miller v Bennett,*[10] the consent of the deceased to an abortion, an infection from which resulted in her death, barred recovery by her personal representative for damages for the death. Surely if the patient's consent bars recovery when the act is immoral or illegal, then certainly consent would bar recovery when the act is neither immoral nor illegal.

Of course if it can be shown by the patient that the sterilization operation (or any operation for that matter) was performed negligently and resulted in injury, then a valid case for money damages has been made out. It is therefore appropriate to indicate the degree of skill to which physicians in Maryland are held in the performance of an operation. The leading Maryland case, *Lane v Calvert,*[11] discusses the question at length. Initially, there is a presumption that the doctor has performed his medical duties with the requisite care and skill. Thus, the burden of proof is upon the patient to show not only a lack of the requisite skill or care on the part of the doctor, but that the want of skill or care was a direct cause of the injury. The amount of care, skill and diligence required is not the highest or greatest, but only such as is ordinarily exercised by others in the profession generally under similar circumstances. The mere fact that an unsuccessful result follows medical treatment is not of itself evidence of negligence.

A very likely area of liability is in the field of **contract.** Specifically, a claim against the operating physician might well ensue if the sterilization procedure is unsuccessful—in short, a suit for breach of contract.

In a suit for breach of contract the patient is generally in a fairly good position as he has obviously undergone an operation for sterilization after a thorough discussion of it with the physician, and with one specific result in mind—absolute sterilization. Certainly a patient would question the physician on the chances of success of the operation prior to undergoing it; the operating physician must therefore be certain the patient clearly understands that the success of the operation cannot be guaranteed, and that such understanding has been adequately documented. Suffice it to say that, in the reported cases, there appears to be a reluctance on the part of the courts to permit the recovery of damages; but, as previously indicated, however, the careful physician will document his understanding with the patient so that there will be no possible misunderstanding.

Compusory Sterilization

One objective of those legislators who feel that a law on sterilization is desirable in Maryland is that it would enable the courts to order compulsory sterilization of persons with certain hereditary forms of mental illness, mental deficiency, and the like.

It is quite true that Maryland has no such enabling legislation which would grant the power to a court, board or other agency, or order compulsory sterilization of either criminals or persons with mental illness or deficiencies thought to be hereditary. More than half of the states have such statutes and they have been subject to attack in many instances; attacks on substantive due process grounds have been increasingly unsuccessful, however, since the Supreme Court's decision in *Buck v Bell.*[12] That was the famous case in which Mr. Justice Holmes, in concluding that the Virginia statute was constitutional, expressed his opinion that three generations of imbeciles are enough.

Even though at face value it certainly appears desirable to sterilize individuals with the afflictions suggested above, it is our view that, since there is so much doubt as to whether the mental deficiencies aimed at are actually transmissible, legislation would not accomplish the desired purpose, but would simply lead to confusion and complicated litigation.

Legislation to Protect the Non-consenting Spouse*

The would-be sponsors of Maryland legislation on sterilization give as a final reason for it that such a law would have a tendency to discourage one marital partner from having a sterilization

*In the excellent article in 113 *University of Pennsylvania Law Review* 415, one subheading, commencing on page 437, deals at length with legal actions by a non-consenting spouse.

procedure performed without the consent and knowledge of the other partner. Thus, we believe it well to discuss the legislation, and possible reasons therefor, as it relates to this point.

Initially a physician would, of course, be interested in knowing whether a voluntary sterilization performed without the consent, or against the wishes, of the other spouse might render him liable to such non-consenting spouse.

There are situations in which the law allows the husband a recovery for the loss of services, society, and sexual intercourse when his spouse has sustained personal injuries at the hands of the defendant (a wife in most states cannot have a similar action). But even though the husband's action for such losses is separate from the wife's cause of action against the defendant for the original tort, the husband cannot recover unless the defendant's conduct toward the spouse were tortious. Since the wife's consent to the operation renders the physician's conduct non-tortious* (assuming throughout that there has been no negligence in the performance of the physician's services), the husband has no cause of action for the losses—with the possible exception of jurisdictions where the courts both (1) hold that sterilization is against public policy *and* (2) hold consent will not preclude even a civil action.

The only other basis for liability against the defendant-physician is on the theory that the defendant's conduct wrongfully interfered with a protected family relationship. These "family interference" torts are subdivided into three groups: (1) enticing a married woman from her husband's domicile; (2) criminal conversation with the spouse (either); (3) alienation of affections of the spouse (either).[14] Maryland retains these categories (*Di Blasio v Kolodner*[15]), although other states sometimes lump all three together as "alienation of affections." It is clear that sterilization has nothing to do with the first two groups and that the physician must be sued, if at all, for alienation of the affections of a spouse. The *University of Pennsylvania Law Review* article concludes that this theory of liability is rather far-fetched and notes the tremendous practical problem of proving that the physician's performing a sterilization operation had anything to do with one spouse's loss of affection for the other.

Entirely apart from this, however, is the fact that in Maryland the cause of action for alienation of affections, or at least the right to sue and recover on it, was abolished by action of the General Assembly in 1945.[16] Not only is the action prohibited, but Article 75C, Section 8 of the Code makes it a crime for a lawyer or litigant to bring such an action; in addition, the allegations in the suit papers would not be privileged, and might well constitute a libel against the physician.

Since the physician has committed no actionable wrong, directly or indirectly, against the legally protected interests of a non-consenting spouse, it is our conclusion that a physician in Maryland may perform a sterilization at the request of one spouse, without the consent, or against the wishes, of the other spouse, and will not be liable in damages to the latter.

Conclusions

In view of the preceding, our conclusions are as follows:

1) From the medical viewpoint, there is no necessity for legislation on sterilization. Any valid objective to be achieved by surgical sterilization of humans can be readily accomplished under existing conditions. There is no doubt but that sterilization procedures in Maryland are being freely carried out at the present time, although we have no exact data as to the number being performed each year.

2) There is grave danger that legislation relating to sterilization might, in fact, end up being restrictive and thus defeat many of the purposes for which it might have been intended. Provisions limiting the types of procedures that may be performed and requiring a thirty-day waiting period are but two examples of the dangers inherent in such legislation.

3) Since all sterilization procedures now being performed in Maryland are being done by duly licensed physicians and surgeons, it is our opinion that there is no more justification for enacting a law on the circumstances surrounding sterilization procedures than there is for a law specifiying

*In an action[13] by a husband against two physicians for, *inter alia*, the wrongful surgical removal of his wife's right breast—wrongful because the husband objected to its removal, the Court of Appeals of Maryland held that "the consent of the wife, not that of the husband, was necessary" (p 170); the consent of the wife having been given, the operation was justified.

under what conditions an appendix or a brain tumor may be removed.

4) At present, the risk of legal action being brought against any licensed physician in Maryland for performing sterilization is so remote as to be negligible, provided the usual safeguard of having obtained written consent is followed.

5) We seriously doubt the validity of the suggestion that a sterilization performed without the knowledge and consent of the other spouse might bring about a rift in the marital relationship; in any event, such legislation does not appear to be necessary as a protection to the physician.

6) In view of the doubt that is so frequently present as to whether certain mental deficiencies are actually transmittible, legislation enabling courts to order compulsory sterilization on these grounds would not, we feel, accomplish the desired purpose, but would simply lead to confusion and complicated litigation.

When uncontrolled diarrhea brings a call for help

When the diarrhea sufferer has run the gamut o home remedies without success, pleasant-tasting CREMOMYCIN can answer the call for help. It can be counted on to consolidate fluid stools, soothe intestinal inflammation, inhibit enteric pathogens, and detoxify putrefactive materials — usually within a few hours.

CREMOMYCIN combines the bacteriostatic agents, succinylsulfathiazole and neomycin, with the adsorbent and protective demulcents, kaolin and pectin, for comprehensive control of diarrhea.

INDICATIONS: Diarrhea.

CONTRAINDICATIONS: Do not use in intestinal obstruction, extensive ulceration of bowel, or diverticulosis; in hypersensitivity to sulfonamides or neomycin; in pregnancy at term, in premature infants, or during first week of life in the newborn.

WARNINGS: Use only after critical appraisal in patients with hepatic or renal damage, urinary obstruction, or blood dyscrasias. Fatal hypersensitivity reactions and blood dyscrasias reported with use of sulfonamides. Consider periodic blood counts, hepatic and renal function tests during intermittent or chronic use.

PRECAUTIONS: Succinylsulfathiazole: Use with caution if there is history of significant allergies and/or asthma. Continued use requires supplementary vitamins B_1 and K. *Neomycin:* Watch for

your ℞ for Cremomycin can provide relief

rare-like neuromuscular block during anesthesia if neomycin used preoperatively in large doses when renal function is or; watch for overgrowth of nonsusceptible organisms. Con- der possibility of ototoxicity and nephrotoxicity with prolonged gh dosage.

DE EFFECTS: As with all sulfonamides: Headache, malaise, an- exia, G.I. symptoms, hepatitis, pancreatitis, blood dyscrasias, uropathy, drug fever, rash, conjunctival and scleral injection, techiae, purpura, hematuria, and crystalluria have been noted. duced fecal output of thiamine and decreased synthesis of amin K have been reported. *Neomycin:* Nausea, loose stools.

fore prescribing or administering, read package circular with oduct or available on request.

romptly relieves diarrheal distress

here today's theory is tomorrow's therapy

BASIC CONSIDERATIONS IN THE CONSTRUCTION OF AN INTENSIVE CARE UNIT

JOSEPH M. MILLER, MD,
Chief, Surgical Service

JOHN J. PETERS, BS,
Testing and Development Center

IDA M. DEVESE, RN
Nursing Service
Veterans Administration Hospital
Fort Howard, Md.

A 10-bed intensive care unit constructed in a 377-bed general medical and surgical hospital has demonstrated the advantages to every hospital of at least one such unit. The problems involved in the planning and installation of a unit are numerous, but can be readily solved with minimal effort and expense and with benefit to all concerned.

Treatment in an Intensive Care Unit, although frequently most appealing to personnel because of inherent activity, is nevertheless but one facet of total patient care. The creation of a good unit will automatically provide for progressive division of patients in a number of categories. Hospitals in the United States have adopted some of the care elements and before long will probably encompass all of them.

Total patient care epitomizes all that is best for both short- and long-term patients. Such care can be divided into five parts:

1. *Intensive care* for seriously ill patients who are concentrated in a single area under constant surveillance and with equipment for resuscitation immediately at hand.
2. *Intermediate care* for patients requiring a modicum of nursing care.
3. *Self care* for patients who require only diagnostic or convalescent facilities of the hotel type, and who can go to the dining room, canteen and moving picture theater.
4. *Long term care* for patients who have chronic brain syndrome, stroke or amputation.
5. *Home care* for patients who report to the hospital periodically until they are well or until their disease is stabilized.

An intensive care unit can provide services for any group of acutely ill medical and/or surgical patients, or for any subdivision in each of the categories. The size and the number of units needed depend upon the size of the individual hospital and the number and scope of patients' diseases. In large medical centers, for example, separate units can be created for patients with coronary occlusion, general surgical problems, and neurological diseases. That all hospitals should have at least one such unit has been demonstrated at the 377-bed Veterans Administration Hospital at Fort Howard, Md, where the installation and use of a single intensive care unit for the treatment of seriously ill medical and surgical patients has resulted in the improved treatment of patients in the unit and throughout the hospital.

Advantages

Isolated physically and functionally, the intensive care unit provides opportunities for uninterrupted nursing care and for a team approach on the part of physicians and nurses to the problems of the patient. Around-the-clock observation of patients and prompt treatment of complications reduce morbidity and mortality in any disease. Better use is made of equipment. Relatives are reassured that the patient is receiving the best possible care, and the hospital can provide it with minimal effort and expense.

Units need not be elaborate and expensive. Frequently the relocation of specialized equipment already owned by the hospital will serve as the nucleus for a unit. Nor is it true, as some people think, that a good unit must contain many of the currently advertised electronic devices, with an electronics expert in constant attendance to assure their proper operation.

Planning The Unit

The question of who plans the unit in the individual hospital can be answered in different ways. In many instances the director will take the lead, while in others the program will be initiated by those with a more direct interest in the care of the patient. In any event, the director should be the coordinator.

New construction is not always necessary since, frequently, an existing area can be adequately renovated. The details of physical features must be decided well in advance of construction. The type of patient will determine whether a large room or cubicles with one or more beds will serve the purpose better. Isolation units may or may not be considered necessary. The size of the unit will depend upon the hospital and the enthusiasm with which the major services enter the project.

The location of the unit may create a problem. If only one area is provided, it should be closest to the service with the greatest workload. The room should be away from heavy traffic, readily accessible to elevators, and near operating room, clinical laboratory, electrocardiographic department, department of roentgenology, and central service. Such an ideal situation usually cannot be found and therefore the site satisfying the majority of the criteria should be selected.

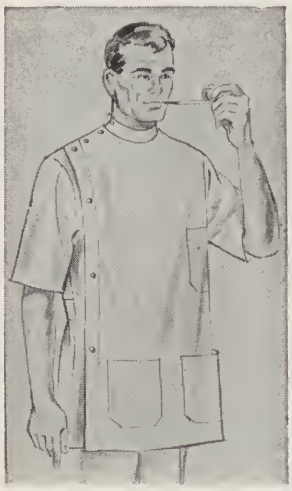
The number of beds required in the unit is also a problem. Statistics from other hospitals are in the formative stage and very often can only be used as a poor guide to what is necessary in a particular situation. In a 377-bed hospital which gives general medical and surgical care and in which the average daily patient load is 335, 10 beds were put in the intensive care unit. Experience has substantiated the wisdom of the estimate. If one large room is used, a distance of eight feet between bed centers should be allotted to provide room for care.

Physical Facilities

Provision of expert care and treatment of acute problems in an expeditious manner demand the presence of certain physical facilities. The basic needs are shown in the following list.

1. Because equipment for resuscitation is run by electricity, there should be four electrical outlets, as well as one wall light on flexible hinges, at the head of each bed. The outlets and good ceiling lights should be connected to an auxiliary power supply. Bluish ceiling lights give an odd tinge to the patient and should not be used.

2. One outlet for oxygen should be on the wall at the head of the bed, with the gas being supplied from a bank of cylinders in a remote region. An alarm system to signal the start of the use of the reserve supply and a shut-off valve for the whole system should be located in the unit. Oxygen is passed through a humidifier and administered by intranasal catheter. Tents present an extreme fire hazard and are never used.



3. Suction is also provided through pipes in the wall and a double-arm distributor at each bed. One part of the unit gives a negative pressure of 200 mm of mercury for air-vent suction and 1-90 mm for gastrointestinal aspiration. The pressure on each side can be graduated. The collection bottles have a capacity of 2,000 ml and are fastened to the wall. The vacuum pump should be connected to the emergency power supply.

4. Beds are the only pieces of furniture. Any bed will serve satisfactorily, but the nursing personnel have found that beds which can be raised or lowered by an electric motor give the greatest convenience. Beds should have large casters and locks. Bedside tables and chairs are not needed. Seriously ill patients do not need personal articles in the unit. A fixed shelf between beds provides space for equipment. Each patient has a separate

wash basin which is hung on a hook under the shelf. Individual bed pans for each patient are not necessary because the few needed can be cleaned and sterilized in an adjacent room. The floor is kept completely free so that equipment necessary for patient use can be easily brought to the bed.

5. Divider curtains hanging from the ceiling provide the necessary privacy in acute clinical situations. At all other times, the curtains are swept back to the wall so that the patients can be observed constantly. Curtain dividers which rest on the floor inhibit free mobility.

6. A proper store room for supplies and equipment is an essential feature.

7. A small unit for bedpan and urinal cleaning should be located in an adjacent room. Adequate facilities for handwashing must be provided.

8. A communication system should be installed between the intensive care unit and the telephone operator of the hospital. In an emergency, nursing personnel can ask the telephone operator to summon help. After a determined hour in the evening, the system can be directly connected to the hospital page system so that a direct call for aid can be made.

9. A waiting room for relatives should be in close proximity to the intensive care unit. A speaker in the communication system should be placed there so that relatives may be summoned for visits.

10. The floor of the intensive therapy unit should not be conductive. Equipment does not need to be explosion-proof.

CREATE THE PROPER PROFESSIONAL IMAGE

. . . in your patients' minds with a beautifully appointed office—professional and elegant decor—and equipped with the newest work-saving equipment. Engineered with your work day and patient load in mind—the Hi-Low Electric Examination Table brings your patient up to you with a touch of the toe, freeing both hands for sterile examinations.

ACCREDITED SURGICAL COMPANY

MEDICAL AND SURGICAL SUPPLIES

8705 COLESVILLE RD. SILVER SPRING, MD. 20910 PHONE 585-7711

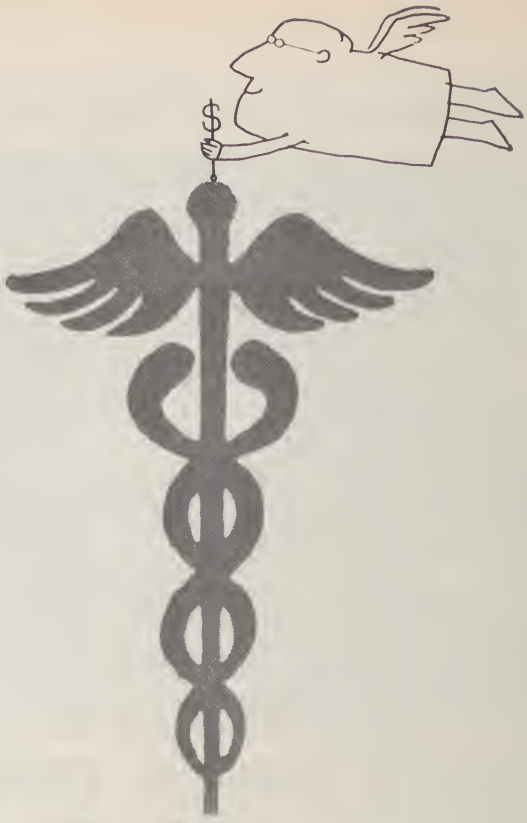
11. The intensive care unit should be air conditioned.

12. Radio and television are not necessary.

Equipment

1. A cardiac monitor with an oscilloscope, audible and visual alarms, and an external and internal cardiac pacemaker is necessary. A defibrillator with a synchronizer should be a part of the apparatus.

2. A small and simple-to-operate respirator is mandatory. A valve-to-patient hose which can be connected to face mask, endotracheal tube, or tracheostomy tube, is used. Manual operation should be possible if electrical current failure occurs.



3. An electro-mechanical instrument for controlling body temperature should be part of the equipment. The need for such an instrument will vary according to the hospital but, even when the item may be considered a luxury, it should be purchased.

Patients Admitted

Patients admitted to the intensive care unit at the VA Hospital have come from the medical service and the surgical service. Admissions were confined to the following groups because patients requiring terminal care, having contagious diseases, or in a state of great excitement, were not admitted.

1. Medical Patients
   a. Cardiac disease
   b. Cerebrovascular accidents
   c. Coma
   d. Infectious diseases which were not contagious
   e. Renal disease
   f. Hepatic disease
2. Surgical Patients
   a. Major operations
   b. General anesthesia
   c. Head injuries
   d. Thoracic injuries
   e. Severe trauma
   f. Hemmorrhage

block end runs

LOMOTIL®

tablets/liquid

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride..... 2.5 mg.
(Warning: May be habit forming)
atropine sulfate .....0.025 mg.

tackles the problem of diarrhea directly

Effectiveness—Physiologic evidence indicates that Lomotil acts directly on the smooth muscle of the bowel to lower motility and control diarrhea. This action is unsurpassed in promptness and efficiency.

Convenience—Lomotil is available as small, easily carried, virtually tasteless tablets and as a pleasant, fruit-flavored liquid.

Versatility—The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or adjunctively in diarrhea associated with:

• Functional hypermotility • Acute infections • Malabsorption syndrome • Drug therapy • Gastroenteritis and colitis • Irritable bowel • Regional enteritis • Ileostomy • Ulcerative colitis • Food poisoning

For correct therapeutic effect
Rx correct therapeutic dosage

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

Children: Total Daily Dosage

3-6 mo. . . ½ tsp.* t.i.d. (3 mg.)
6-12 mo. . ½ tsp. q.i.d. (4 mg.)
1-2 yr. . . ½ tsp. 5 times daily (5 mg.)
2-5 yr. . . . 1 tsp. t.i.d. (6 mg.)
5-8 yr. . . . 1 tsp. q.i.d. (8 mg.)
8-12 yr. . . 1 tsp. 5 times daily (10 mg.)

Adults: 2 tsp. 5 times daily (20 mg.)
(or 2 tablets q.i.d.)

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the initial daily dosage.

Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Recommended dosages should not be exceeded. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

when congestion is complicated by sulfa-susceptible bacterial invaders in the upper respiratory tract...

re-enforce your decongestant therapy

prescribe economical Trisulfaminic®

Each tablet contains: Triaminic® 25 mg. (phenylpropanolamine hydrochloride 12.5 mg., pheniramine maleate 6.25 mg., pyrilamine maleate 6.25 mg.); Trisulfapyrimidines, U.S.P. 0.5 Gm. (sulfadiazine 0.167 Gm., sulfamerazine 0.167 Gm., sulfamethazine 0.167 Gm.)

PHARMACOLOGY: Triaminic decongests and promotes drainage of nasal and paranasal passages, and prevents any further histamine-induced damage; the triple sulfonamides inhibit susceptible bacterial invaders. INDICATIONS: For congestion and infection of the upper respiratory tract caused by sulfa-susceptible organisms. DOSAGE: Adults: 2 to 4 tablets initially, followed by 2 tablets every 6 hours. Medication should be continued until patient has been afebrile for 3 days. ADVANTAGES: The advantages of Trisulfaminic in upper respiratory infections are: freedom from narcotics or alcohol; therapeutic reliability; safety; economy; ease of administration; freedom from potential sensitization to broad-spectrum antibiotics which may be reserved for lower respiratory or other infections caused by susceptible organisms. CONTRAINDICATIONS: Contraindicated in sulfonamide and antihistamine sensitivity, impaired renal function, pregnancy approaching term, and in premature infants and newborn infants during the first month of life. Do not use in patients with glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloroduodenal or bladder neck obstruction. WARNING: Use only after careful evaluation in patients with liver or renal damage, urinary obstruction, or blood dyscrasias. Deaths have been reported from hypersensitivity reactions with administration of sulfonamides. In intermittent or prolonged therapy, blood counts and liver and kidney function tests should be performed periodically. Sulfonamide therapy may potentiate the hypoglycemic action of sulfonylureas. PRECAUTIONS: Use with caution in patients with histories of significant allergy or asthma. Assure an adequate fluid intake. Because the antihistamines may cause drowsiness of varying degree, warn patients about activities requiring alertness such as driving a car or operating dangerous machinery. Use with caution in the presence of hypertension, hyperthyroidism, cardiovascular disease and diabetes. ADVERSE REACTIONS: As in all sulfonamide therapy, the following reactions may occur: headache, nausea, vomiting, diarrhea, icterus, hepatitis, pancreatitis, urticaria, rash, fever, cyanosis, hematuria, crystalluria, proteinuria, blood dyscrasias, petechiae, purpura, neuropathy and injection of the conjunctiva and sclera. If one or more of these reactions occur, the drug should be discontinued. With antihistaminic therapy there have been reports of sedation varying from mild drowsiness to deep sleep, dizziness, lassitude, inability to concentrate, fatigue, incoordination, tinnitus, blurred vision, diplopia, euphoria, nervousness, insomnia, tremors, palpitation, hypotension, headache, chest tightness, urinary frequency, dysuria, tingling of the hands, dryness of the mouth, throat, and nose, gastrointestinal disturbances such as epigastric distress, anorexia, nausea, vomiting, constipation and diarrhea and very rarely, leukopenia and agranulocytosis. Adverse reactions reported with the use of sympathomimetic amines include anxiety, tension, restlessness, nervousness, tremor, weakness, insomnia, headache, palpitation, tachycardia, angina, elevation of blood pressure, sweating, mydriasis, anorexia, nausea, vomiting, dizziness, constipation, and dysuria due to vesicle sphincter spasm. PACKAGE INFORMATION: Trisulfaminic Tablets: Supplied in bottles of 100 tablets. CAUTION: Federal law prohibits dispensing without prescription.

DORSEY LABORATORIES • *a division of The Wander Company* • **LINCOLN, NEBRASKA**

brings peace to the hyperactive colon

CANTIL®
(mepenzolate bromide)

helps restore normal motility and tone

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

SEMIANNUAL MEETING SEPTEMBER 9, 1966

MINUTES

The 255th meeting, semiannual session, of the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland was called to order at 9:35 AM, Friday, September 9, 1966, at Ocean City, Maryland, the President and Secretary being present.

The following delegates (or alternates) were registered as being in attendance. The asterisk indicates an alternate delegate:

Doctors: Manning W. Alden, Council; John G. Ball, Montgomery County; Richard D. Bauer, Council; *E. I. Baumgartner, Garrett County; Harry McB. Beck, Baltimore County; Donald W. Benson, Baltimore City; M. McKendree Boyer, Past-president; Henry A. Briele, Council; Frank E. Brumback, Washington County; Wendell J. Burkett, Kent County; Read N. Calvert, Montgomery County; Robert vL. Campbell, Council; Douglas G. Carroll, Baltimore City; Robert G. Chambers, Baltimore City; *Katherine A. Chapman, Montgomery County; Henry V. Chase, Council; *David S. Clayman, Prince George's County; Archie R. Cohen, Council; H. Douglas Cooper, Wicomico County; Ernest I. Cornbrooks, Baltimore City; William B. Culwell, Carroll County; Worth B. Daniels, Jr., Baltimore City; John B. DeHoff, Baltimore City; DeWitt E. DeLawter, Montgomery County; Everett S. Diggs, Council; J. Sheldon Eastland, Council; William Carl Ebeling, Council; Robert W. Farr, Council; James McC. Finney, Harford County; Russell S. Fisher, Council; Harold H. Gist, Washington County; *Edward G. Grau, Baltimore County; *Paul F. Guerin, Baltimore County; William B. Hagan, Council; John C. Harvey, Baltimore City; Thomas F. Herbert, Howard County; Philip W. Heuman, Harford County; *H. Logan Holtgrewe, Anne Arundel County; James P. Jarboe, St. Mary's County; William T. Joyce, Montgomery County; Ferd E. Kadan, Baltimore City; James R. Karns, Baltimore City; Lauriston L. Keown, Baltimore City; Howard F. Kinnamon, Past-president; Henry P. Laughlin, Council; *Eugene J. Linberg, Baltimore City; F. Ford Loker, Baltimore City; George S. Malouf, Prince George's County; Karl F. Mech, Council; Philip W. Mercer, Carroll County; Walter C. Merkel, Board of Medical Examiners; B. Martin Middleton, Council; John E. Miller, Baltimore City; Donald W. Mintzer, Baltimore City; Andrew C. Mitchell, Wicomico County; Howard T. Morse, Montgomery County; *F. E. Musser, Prince George's County; Clayton Norton, Anne Arundel County; Charles F. O'Donnell, Council; *Theodore C. Patterson, Baltimore County; A. Austin Pearre, Past-president; William A. Pillsbury, Council; *Carolyn S. Pincock, Montgomery County; J. Emmett Queen, Council; Belden R. Reap, Sr., Montgomery County; J. Morris Reese, Council; Guy M. Reeser, Jr., Talbot County; Thomas R. Reid, Frederick County; Paul F. Richardson, Baltimore City; Raymond C. V. Robinson, Baltimore City; Donald J. Roop, Council; Edwin R. Ruzicka, Talbot County; *William J. Rysanek, Jr., Baltimore City; Emmanuel A. Schimunek, Baltimore City; Thaddeus C. Siwinski, Baltimore County; Aaron C. Sollod, Baltimore City; *William G. Speed, III, Baltimore City; Omar D. Sprecher, Jr., Washington County; Martin E. Strobel, Baltimore County; E. L. Suarez-Murias, Baltimore City; *Ivory U. Sully, Jr., Worcester County; Thomas E. VanMetre, Jr., Baltimore City; Merton T. Waite, Anne Arundel County; Emerson Walden, Baltimore City; J. Arthur Weinberg, Council; *William C. Weintraub, Prince Georges County; Eldridge H. Wolff, Dorchester County; *Charles E. Wright, Frederick County; Raymond M. Yow, Council; Walter N. Kirkman, Council.

Present also for the meeting were staff personnel.

The President made certain announcements with regard to the conduct of business at the session.

The minutes of the April 26 and April 29, 1966 meetings respectively of the House of Delegates, annual session, having been distributed to the members, and having been approved by the Executive Committee, were presented to the House for information.

EMERITUS MEMBERSHIP

On the recommendation of the Council, the following member was elected to Emeritus Membership:

Victor Goldberg, MD, Baltimore City

MEDICOLEGAL COMMITTEE REPORT

Howard F. Kinnamon, MD, Chairman of the Medicolegal Committee, on its behalf, moved adoption of the following amendments to the Medicolegal Code of Cooperation, such amendments having already been adopted by the Baltimore City Bar Association and the Maryland State Bar Association, which, after debate were adopted:

MEDICAL EXAMINATIONS AND REPORTS

2. REPORTS TO PATIENT OR HIS ATTORNEY:

The patient, or his attorney, upon written request, when accompanied by a signed authorization from the patient, shall be entitled to a prompt report from an attending physician, containing the history, physical condition, diagnosis and prognosis, but not including an evaluation of disability. The physician's fee for such report should be commensurate with the time and effort devoted to its preparation.

PROPOSED PARAGRAPH FIVE

5. REFERRALS BY ATTORNEYS:

Attorneys are cautioned not to refer a patient under treatment to another physician for examination, consultation or treatment without the knowledge of the physicians involved. The physician to whom the patient is referred may be guilty of a breach of ethics if he accepts a patient for examination, consultation or treatment without the knowledge of the treating physician.

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity),
100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

FACULTY DELEGATES TO THE AMA REPORT

The report of the Faculty's Delegates to the American Medical Association was filed.

BUILDING COMMITTEE REPORT

Dr. Pillsbury, Secretary, on behalf of the Building Committee, moved adoption of the following motion which was unanimously passed:

> That the Building Committee be dissolved and the control of the funds presently held in the committee be transferred to the Treasurer in accordance with Article III, Section 10, of the Bylaws; such funds to be held in separate Building Fund accounts.

REFERENCE COMMITTEE REPORT

Dr. Diggs, on behalf of the Reference Committee, reported to the House with respect to Resolution 1S/66, and recommended that it not be adopted.

RESOLUTION 1S/66 REJECTED AS AMENDED

After debate and amendment, the House rejected Resolution 1S/66, as amended, which read as follows:

Whereas, The Medical Practice Act of the State of Maryland is interpreted as precluding the Corporate Practice of Medicine; and

Whereas, No adequate substitutes for the current methods have been forthcoming that will provide the same level of teaching cases for medical students, interns and residents; therefore be it

Resolved, That this body instruct the Legislative Committee, in conjunction with the Faculty's legal counsel, to communicate with the proper State Legislative body and propose a bill to amend the Medical Practice Act to allow such "Corporate Practice," in said hospitals.

RESOLUTION 2S/66 ADOPTED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 2S/66 be adopted.

After debate, the House adopted Resolution 2S/66, which read as follows:

Whereas, The physician has more paper work than is good for him; and

Whereas, The trend of good medical practice is toward more and more laboratory procedures and insurance work; and

Whereas, The requisitions of the Maryland State Department of Health, Bureau of Laboratories; as well as many Insurance Companies, are unnecessarily cumbersome; be it

Resolved, That the Faculty's Liaison Committee review requisition forms of the Maryland State Department of Health, Bureau of Laboratories; Insurance Companies; and Blue Cross and Blue Shield; so as to recommend elimination of unnecessary detail; and be it

Resolved, That such Committee hold hearings where the affected physicians could voice their grievances and make appropriate recommendations.

RESOLUTION 3S/66 REJECTED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 3S/66 be NOT adopted.

After debate, the House rejected Resolution 3S/66, which read as follows:

Whereas, Current medical and lay opinion deems it the responsibility of every physician to practice preventive medicine and screen for the earliest signs of curable disease; and

Whereas, The scope of the Maryland Public Health Laboratory, as defined in Section 35, Article 43, Annotated Code of Maryland, 1965 Supplement, is ". . . to provide laboratory services in screening or surveillance;" and

Whereas, The Commissioner of Health has seen fit on April 18, 1966, to define screening programs as "planned studies, within identifiable population groups toward the detection in early stages of diseases in presumably well people," and to rule, "That test specimens taken by practitioners are not at the present time to be part of the departmental screening program;" therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland considers arbitrary and unlawful the Commissioner of Health's exclusion of the practicing physician's screening activity from the benefits of the Maryland State Department of Health Laboratory Services, and that the Faculty use its offices to persuade the Commissioner of Health to rescind this part of his directive.

RESOLUTION 4S/66 ADOPTED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 4S/66 be adopted.

After debate, the House adopted Resolution 4S/66 which read as follows:

Whereas, There is an increasing demand on the part of the health insurance-buying public for the full coverage of fees for professional services; and

Whereas, The implementation of the Medicare Program will undoubtedly further increase the demand for such coverage; and

Whereas, Fee schedules for paid-in-full programs tend to become obsolete as the economy rises; and

Whereas, Most physicians in private practice feel strongly that the most appropriate way to provide such coverage, on an insured basis, is through the medium of programs that make payments for professional services on the basis of reasonable and customary fees for covered services; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland urge the Maryland Blue Shield Plan to develop without delay a program whereby professional fees will be covered on the basis of reasonable and customary charges; and that such program, when developed, be sold as widely as possible to the end that it may supersede existing scheduled fee programs to the greatest extent practicable.

RESOLUTION 5S/66 ADOPTED AS AMENDED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 5S/66 be adopted.

The House, after debate and amendment, adopted Resolution 5S/66, which read as follows:

Whereas, The passage of Public Law 89-97, commonly known as the Medicare Act, amends the Social Security Act by creating, under Title XVIII, a program of Health Insurance for the Aged, and, under Title XIX, a program of Grants to States for Medical Assistance Programs; and

Whereas, Under both programs it is the clear intent of the Congress that payment for care provided thereunder shall be on the basis of reasonable cost or charges; and

Whereas, Under Title XIX of Public Law 89-97, the State and Federal Governments are jointly responsible for paying the reasonable cost of the provision of medical care for disadvantaged persons; and

Whereas, Government's assumption of the cost of such care removes the beneficiaries under such programs from the medically indigent category; and

Whereas, It is not the intent of Public Law 89-97 to interfere in any way with the close personal relationships between beneficiaries and their physicians, nor to adversely affect the quality of medical care because of inadequate financing of the cost of such care; and

Whereas, It has been clearly demonstrated in the Military Dependents Medical Care Program that average payments for professional services have been consistently lower in those areas in which such payments have been made on the basis of usual, customary and reasonable charges, without published fee schedules, than in those in which published fee schedules were used; now therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland, representing the practicing physicians in Maryland, develop immediately with the Maryland State Department of Health a program of health care for the disadvantaged,

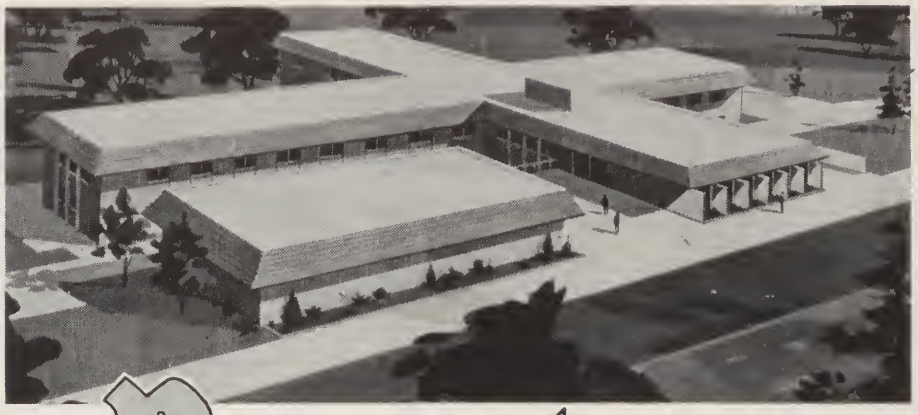
For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.



Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

Call or write for brochure. Phone 736-0240

8100 Marlboro Pike, Forestville, Maryland

under the provisions of Title XIX of Public Law 89-97, under which all payments for professional services shall be on the basis of usual, customary and reasonable charges; and be it further

Resolved, That, effective immediately, all physicians be urged to bill at their usual customary and reasonable fees in order that the Health Department be aware of the extent to which physicians are now subsidizing the Medical Care Program, even though it is recognized that payments must, perforce, be made on the basis of current budgeted funds; and be it further

Resolved, That copies of this resolution be sent to the Governor of the State of Maryland, the Budget Bureau of the State of Maryland, the Maryland State Board of Health and Mental Hygiene, and the Commissioner of Health of the State of Maryland.

RESOLUTION 6S/66 ADOPTED AS AMENDED

Dr. Diggs, on behalf of the Reference Committee, recommended that Resolution 6S/66 be adopted.

The House, after debate and amendment, adopted Resolution 6S/66 which read as follows:

Whereas, The present provisions of the Workmen's Compensation Law, Article 101, Section 37 (c), reads as follows:

> "All fees and other charges for such treatment and services shall be subject to regulation by the Commission, and shall be limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living.";

Whereas, The trend today is toward payment of the physician's usual, customary and reasonable fees; and

Whereas, Hospitals throughout the State are permitted to bill Carriers or others on the basis of their posted charges, without obtaining permission for any increases in such charges; now, therefore, be it

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland go on record as urging its members to submit bills for payment of "usual, customary and reasonable fees" for professional services rendered Workmen's Compensation Cases, as well as all other Governmental agencies.

OPPOSITION TO COMPULSORY ASSESSMENT OF HOSPITAL STAFF MEMBERS

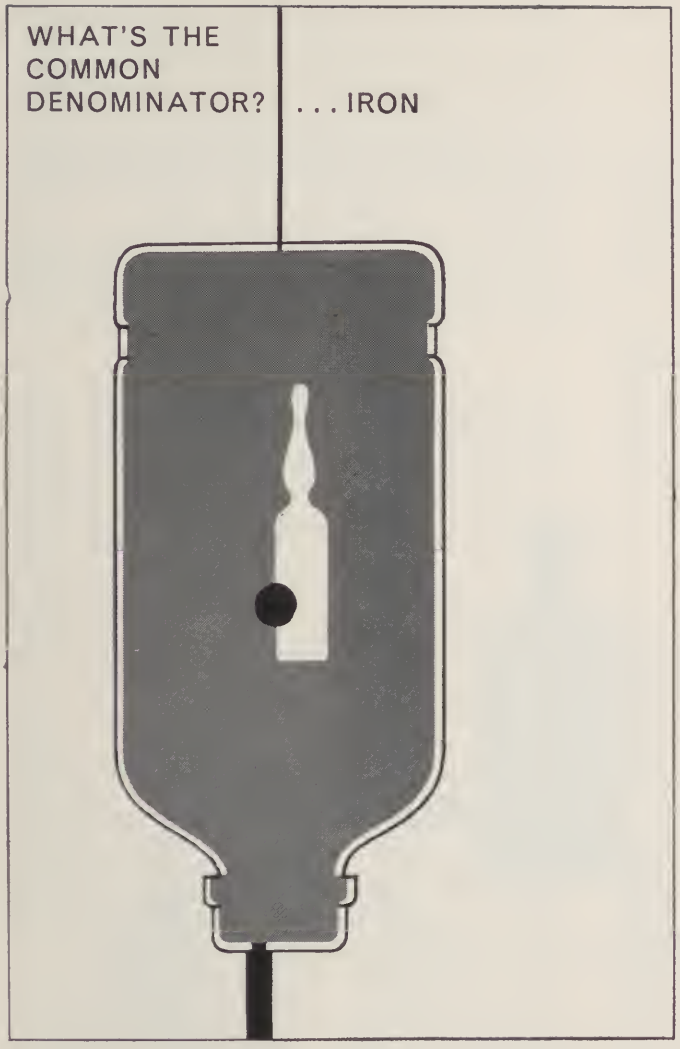
Dr. Rysanek presented the following resolution for consideration of the House of Delegates. On more than a two-thirds vote, it was agreed to consider it and it was adopted as follows:

Resolved, That this House of Delegates go on record as being in opposition to the *compulsory assessment* of hospital staff members for hospital construction or equipment.

LEGISLATIVE CHAIRMAN REPORT

Dr. Middleton, Legislative Chairman, addressed the House and asked for assistance and cooperation when the 1967 Legislature convenes whenever the members may be called upon.

MEDIC NETWORK APPROVED



Dr. Mech, Treasurer, presented the following motion for adoption by the House which, after debate, was adopted as follows:

Resolved, That the Medic Network be approved for the 1967 calendar year.

There being no further business, the President made several announcements, following which the House, by unanimous consent, adjourned *sine die* at 11:25 AM.

WILLIAM A. PILLSBURY, MD, SECRETARY

In fact, there's as much iron...250 mg. ...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

SEMIANNUAL MEETING
September 9, 1966

REPORTS

To the House of Delegates

DELEGATES TO THE AMERICAN MEDICAL ASSOCIATION

Mr. President and Members of the House of Delegates:

HOUSE OF DELEGATES MEETING, JUNE 26-30, 1966, CHICAGO, ILL.

As was to be expected, Medicare and its impact on the practicing physician was high on the agenda for consideration when your delegates attended the 115th annual session of the American Medical Association. In the first night session for more than 10 years, the House met to discuss various Reference Committee reports, make amendments to them, and adopt them as amended. A summary of the actions taken at this meeting follows. When appropriate, material has been disseminated to committees of the Faculty for their action.

Medicare

In accepting and commending a Board of Trustees report on Medicare, the House recommended that "the Association give wide dissemination to the information contained therein, particularly its informed discussion of direct billing, the basic purposes of utilization review, the rejection of compensation for service on such committees except in exceptional circumstances, and the proper placement of any onus of responsibility for any failure in the Medicare program."

The Board report ended with the following conclusion:

During the past year many individuals have represented the American Medical Association and the physicians of the United States by meeting frequently with officials of the Department of Health, Education and Welfare. This degree of cooperation on our part should be viewed as a recognition by responsible citizens of an obligation to obey the law of the land, including this law with which we disagree. Our specific purposes have been to provide expert assistance to the government so that this law could be implemented in a manner most helpful to the beneficiaries while disturbing the practice of medicine to the minimum degree. Despite our best efforts, it is apparent that serious problems are inevitable in connection with the implementation of this law, and we trust that the physicians and the public will place the blame for such deficiencies squarely where they belong—on the federal government.

We are proud of the role we have assumed, and in many instances our efforts have been productive. Proposed forms were simplified; some unnecessary forms eliminated, and a number of our suggestions was incorporated in regulations and procedures. An informative "Reference Guide" for physicians, recently distributed, was prepared with consultation of AMA staff. Numerous other items will continue to receive our most serious study and consideration, and the Board urges and requests that every member exhibit his personal diligence by supplying his local medical society documented evidence of transgressions of the spirit or the letter of the law as it is implemented.

The Board of Trustees intends to continue to supply advice, guidance, and dissent when necessary to the Government or to other third parties on matters that pertain to the health of the public and the interests of the medical profession.

The House strongly supported the general concept of individual responsibility and endorsed a report from the Council on Medical Service which included the following statement:

Since the Council believes that the current interest in the doctrine of individual responsibility stems in large part from concern over the matter of assignments under PL 89-97, it hastens to add that, as a matter of American Medical Association policy, the Council on Medical Service recommends reaffirmation of the responsibility of individual physicians for determining how they will govern their professional practices under this law and that physicians should be made acutely aware of the manifest superiorities of direct billing as previously communicated to this House in the Council's Report E (A-66) on "Recommendations on the Physician's Role in Medicare."

The latter report (Report E) was highly commended, and the House recommended its widest possible dissemination, including publication in its entirety in a prominent place in the earliest possible issue of *AMA News*.

Physicians' Billing Procedures

In connection with the Medicare part of Public Law 89-97, the House also adopted three resolutions which recommended that physicians use the direct billing method rather than the assignment procedure. At the same time, the House pointed out that adoption of these resolutions should not be interpreted as contravening the statement approved at the Special Session in October, 1965, which said:

The American Medical Association opposes any program of dictation, interference or coercion, whether direct or indirect, affecting the freedom of choice of the physician to determine for himself the extent and manner of participation or financial arrangement under which he shall provide medical care to patients under Public Law 89-97.

In considering a resolution on the right to bill patients under Title 19 of the law, the House passed an amendment pointing out that direct billing has been recommended as the billing method of choice under Title 18 by the Board of Trustees and the Council on Medical Service. It then said that since there is a wide latitude available to the states in establishing administrative procedures under Title 19, each state medical association should work early and diligently in its own state so that any plan or law adopted in its state for approval under Title 19 would include authorization for direct billing.

The House also instructed the AMA Advisory Committee to the Department of Health, Education and Welfare to do all in its power to implement the intent of the resolution at the national level. In addition, the House urged positive steps to obtain statutory authority for a continuing medical advisory committee under Title 19, and it called on the AMA and the state societies to maintain added vigilance to eliminate any patterns which might subvert the intent of Title 19.

Hospital-Based Physicians

The House passed two resolutions involving billing and reimbursement principles affecting hospital-based specialists but also of significance to all physicians. The first said:

The *Principles of Medical Ethics* declare that a physician

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides.* Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day.*

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

shall not dispose of his services to a third party or "lay" organization, and

Title XVIII of Public Law 89-97 recognizes the principle of the separation of professional and hospital costs for services rendered by hospital-based physicians; and

This principle has been advocated by the AMA, the American College of Radiology, the American College of Pathologists, and many regional organizations, and

A great number of hospital-based physicians throughout the nation have declared their intention to bill separately for their professional services in keeping with this principle; therefore be it

Resolved, that, since separate billing by the physician for his professional services is a preferred ethical practice, it shall be deemed unethical for a physician to displace a hospital-based physician who is attempting to practice separate billing when said displacement is primarily designed to circumvent separate billing.

The second resolution regretted that publication of Medicare Regulations #5 (which provides for reimbursement of hospital-based physicians and establishes rather stringent rules that would "lock" physicians into their present arrangements) was delayed until June 28, three days before the effective date of Medicare, and said that these regulations do not conform to the intent of Congress as expressed in Section 1801 of the Medicare law. It then declared that:

The House of Delegates instruct the Board of Trustees and the Executive Vice President to request from the Social Security Administration an extension of date of final adoption of the proposed regulations of not less than 90 days, in order that the American Medical Association and all other interested medical organizations be allowed reasonable time to study, and to submit to the Social Security Administration, data, views or arguments and pertinent constructive comments and suggestions.

To preserve the professional independence of medical practice that the Board of Trustees and Officers of the AMA be instructed to immediately inform the membership that Medicare Reg. #5 will not apply to physicians (whether hospital-based or not) who

1. have no financial relationship with a hospital covering medical services to patients
2. do not accept assignments but bill directly

The AMA News and other appropriate media be used to advise all physicians who are developing contractual relationships with hospitals for professional service that they should delay the finalization of any agreements pending further analysis of the implementing regulations.

Medical Ethics

In acting upon a Board of Trustees recommendation that a physician may participate in the ownership of a pharmacy or regularly dispense drugs, remedies or appliances or provide eyeglasses to his patients *only when approved by his component and constituent medical associations and when it is determined by them to be necessary in the best interests of the patient,* the House approved the following reference committee statement:

The *Principles of Medical Ethics* provide: "Drugs, remedies or appliances may be dispensed or supplied by the physician provided it is in the best interests of the patient." Your reference committee reaffirms the 1963 House of Delegates interpretation of the words "in the best interest of the patient," which reads as follows:

"It is the opinion of the Judicial Council that this language was adopted to permit both the practicing physician and the local medical societies to evaluate the many factual situations incident to prescribing and dispensing which are bound to arise in the practice of medicine. Under this language the doctor is permitted to exercise his own best judgment when caring for his patient It is known that there will be situations when it is necessary or desirable for a physician to dispense or supply what he has prescribed. The *Principles* permit this to be done. On the other hand, this broad language provides a means by which a component medical society can inquire into the facts of a particular practice. The profession thus can act to prevent abuse of discretion and protect patients from exploitation. In essence this language means that a physician in the exercise of sound discretion may dispense 'in the best interest of his patient'; it does not authorize him to dispense solely for his convenience or for the purpose of supplementing his income."

The reference committee approves the goals sought by the Board's report but disapproves its specific recommendations. It notes that mechanisms presently exist for processing charges of deviation from the foregoing ethic and urges that these mechanisms be made vitally active at local level. When charges of deviation develop, complaints should be made to the local society and vigorously processed by the appropriate committee of that society. If they are not resolved thereby, the complaints should then be carried to the state constituent association. The prudent physician will always seek the guidance of his local medical society in situations relating to ethical conduct.

The House directed the Board of Trustees to take action as expeditiously as possible to give wide dissemination to the reference committee report.

Discrimination

The House received six resolutions dealing with discrimination against some applicants for membership in component medical societies. It called attention to the strong position taken by the House in 1964 but pointed out that it is difficult to follow the 1964 directive because there is now no mechanism at the national level whereby a rejected applicant for membership at county or state level may obtain a hearing in order to right an alleged wrongful discrimination.

In lieu of the six resolutions, the House adopted a substitute resolution which directed the Council on Constitution and Bylaws to prepare such changes in the Constitution and Bylaws, "as may be necessary to permit the Judicial Council to receive and act upon appeals filed by applicants who allege that they have been unfairly denied membership in a local and/or state society." The House asked the Council to report its recommendations at the 1966 Clinical Convention.

Health Manpower

On the subject of health manpower the House received reports from the Board of Trustees, Council on Medical Education and Council on Medical Service and also one resolution. In general, all of them urged the AMA to assume leadership and mobilize its efforts to meet present and future shortages in health manpower. The House approved the Board report, announcing appointment of a Committee on Health Manpower, and adopted the resolution. The two Council reports were referred to the new Board committee.

In taking these actions, the House approved a reference committee statement which included the following:

Your Reference Committee is well aware of the drastic shortage of health manpower that is confronting the American public. It is keenly appreciative of the opportunity presented to the American Medical Association to furnish leadership in the solution of this problem. The necessary additional manpower in the medical profession and in allied health professions must be developed. The most effective and efficient utilization of existing health manpower must be made at all times. This is no time to surrender leadership to persons or organizations outside of the medical profession.

AMA Dues Increase

By a vote of 168 to 46, the House approved an increase in AMA annual dues from $45 to $70, effective January

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

EVERY DAY

1, 1967, thus confirming a Board of Trustees recommendation which was given initial approval at the 1965 Clinical Convention.

The House, in approving the dues increase, accepted a reference committee statement which said:

It is quite apparent that the programs necessary to serve the needs of the members of the Association cannot be conducted effectively without adequate financing and it is equally apparent that such adequate financing is impossible without the dues increase requested by the Board of Trustees. Your Reference Committee reaffirms its confidence in the judgment of the Board of Trustees which has in the past and must in the future exercise the most careful and prudent stewardship over the assets of the Association. The Board of Trustees is the Committee elected by the House of Delegates to investigate and control the finances of the Association. The appointment of any other committee to perform this function would be most inappropriate

Other Actions

In considering 106 resolutions, 38 board reports and at least 20 additional reports from councils and other groups, the House of Delegates also:

Endorsed the *Declaration of Helsinki*, already adopted by the World Medical Association, as a guide to those who are engaged in clinical medical investigation;

Reaffirmed its opposition to the *compulsory assessment* of hospital staff members in order to raise funds for hospital construction;

Reconsidered its action in defining *usual, customary and reasonable* fees and referred the matter back to the Council on Medical Service for further study;

Urged all state and county medical societies to send representatives to the *Third National Congress on Medical Quackery* to be held October 7-8, 1966, in Chicago;

Commended the *American Medical Association Education and Research Foundation* for its accomplishments during the past four years and gave a standing vote of gratitude to Dr. Raymond M. McKeown, AMA-ERF president since 1962;

Strongly endorsed the *AMA Volunteer Physicians for Vietnam* program and urged the entire profession to support it by word and deed; approved a recommendation by the AMA survey team and the Board of Trustees that the Association organize and administer a program of American assistance in *medical education in South Vietnam* supported by the U.S. Agency for International Development; was impressed by a report from Dean Pham Bieu Tam of the Faculty of Medicine, *University of Saigon,* and urged that the AMA do everything possible to assure that volunteer physicians caring for the South Vietnam civilian population are properly supplied with medicines and other *medical supplies;*

Adopted a resolution urging constituent medical associations to oppose, as detrimental to the public interest, any proposed legislation that would authorize *optometrists* to engage in the diagnosis or treatment of disease or injury of the eye;

Approved, with minor editorial revisions, a final report from the Committee on Maternal and Child Care of the Council on Medical Service dealing with the medical care aspects of *"Combating the Problems of Unwed Parents";*

Agreed with a strong policy statement condemning the *abuse of LSD* and other non-narcotic drugs, pointing out that the illicit use of LSD is subverting and vitiating important and necessary valid experimental studies, and recommending that the manufacture and distribution of LSD be continued as needed under strict control, with the drug being made available only to competent research workers (physicians trained in its use) on approval of the Department of Health, Education and Welfare;

Reaffirmed its opposition to the compulsory regulation of any *single* method, such as the use of generic terms, of the *prescribing of drugs;*

Offered AMA cooperation, in order to prevent public fear and misunderstanding, to those *foundations and other groups* which request it in clarifying statistical data, visual media and other forms of medical information to be presented to the public so as to provide an accurate view of the problems or problem with which they are concerned;

Adopted a humorous resolution and an equaliy humorous reference committee report which requested that "in the future full air-conditioning be considered as a prerequisite in the selection of the headquarters hotel for the annual AMA Convention in those cities where the *psychophysiological effects of heat* may interfere with effective delegatemanship";

Received as information a comprehensive report on the *Relation of Medicine and Osteopathy,* which contains much material pertinent to future policy considerations, and also approved in principle a recommendation that doctors of osteopathy be commissioned in the *Armed Forces Medical Services;*

Agreed with a report recommending that the core curriculum plan for continuing medical education be *not* approved in its present form, that no further core curricula be developed at this time, and that various methods of continuing medical education be studied under the auspices of the Council on Postgraduate Programs;

Expressed its opposition to the *Hart bill,* S. 2568, and all similar legislation;

Adopted reports from the Council on Medical Service on a *Model Emergency Department Agreement* and on *Multiple Coverage in Voluntary Health Insurance;*

Approved Board reports on *Exercise and Physical Fitness,* encouraging state and local medical societies to support the promotion of fitness programs, and on *Venereal Disease Control,* emphasizing the continued need for all physicians to report all cases that come to their attention, and

Authorized the Speaker of the House to appoint a *Resolutions Consultation Committee,* purely for editorial advisory purposes, at subsequent AMA conventions.

Attendance

All three of the Faculty's delegates attended all business sessions of the House. In addition, the senior alternate delegate and another alternate delegate, Charles F. O'Donnell, MD, were present.

Respectfully submitted,
Robert vanL. Campbell, MD
J. Sheldon Eastland, MD
Russell S. Fisher, MD
William B. Hagan, MD,
Senior Alternate Delegate

BUILDING COMMITTEE

Mr. President and Members of the House of Delegates:

This committee has been relatively inactive during the past few years, since the completion of the building renovations. In view of this fact, the committee recommends:

That the Building Committee be dissolved and the control of funds presently held in the committee be transferred to the Treasurer in ac-

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®
(desipramine hydrochloride)
non-sedating • rapid-acting
ANTIDEPRESSANT

helps restore normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) often reverses the signs and symptoms of depression including sleep disturbances feeling of sadness, guilt, anxiety, worthlessness and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

MEDICOLEGAL COMMITTEE

Mr. President and Members of the House of Delegates:

The Medicolegal Committee presents the following amendments to the Code of Cooperation between the Maryland State Bar Association and the Baltimore City Bar Association, as adopted by this House in September, 1964.

Both the Baltimore City Bar Association and the Maryland State Bar Association have adopted these proposed amendments.

MEDICAL EXAMINATIONS AND REPORTS

AMENDMENT TO PARAGRAPH TWO

2. *Reports to Patient or his Attorney:* The patient or his attorney, upon written request, when accompanied by a signed authorization from the patient, shall be entitled to a prompt report from an attending physician, containing the history, physical condition, diagnosis and prognosis, but not including an evaluation of disability. The physician's fee for such report should be commensurate with the time and effort devoted to its preparation.

PROPOSED PARAGRAPH FIVE

5. *Referrals by Attorneys:* Attorneys are cautioned not to refer a patient under treatment to another physician for examination, consultation, or treatment without the knowledge of the physicians involved. The physician to whom the patient is referred may be guilty of a breach of ethics if he accepts a patient for examination, consultation, or treatment without the knowledge of the treating physician.

REFERENCE COMMITTEE

Mr. President and Members of the House of Delegates:

Your Reference Committee met on Thursday, July 28, 1966, to discuss the resolutions referred to it and which are to be considered by the House of Delegates on September 9, 1966. The committee was pleased with the excellent attendance at the session and was encouraged by the interest and discussion that took place.

As has been the custom, your Committee will recommend action to the House. The question, however, will be on the resolution itself and not upon the committee report. All decisions were reached in accordance with the Faculty's Bylaws, Article XI, Section 24.

RESOLUTION 1S/66

Submitted on:	March 3, 1966
Introduced by:	St. Mary's County Medical Society
Subject:	Changes in the Medical Practice Act to Permit Hospitals Associated with Medical Schools to Practice Medicine

Whereas, The Medical Practice Act of the State of Maryland is interpreted as precluding the corporate practice of medicine; and

Whereas, It is generally interpreted by the medical profession that those hospitals associated with medical schools are, in fact, engaged in the "corporate practice of medicine"; and

Whereas, No adequate substitutes for the current methods have been forthcoming that will provide the same level of teaching cases for medical students, interns, and residents; therefore be it

Resolved, That this body instruct the Legislative Committee, in conjunction with the Faculty's legal counsel, to communicate with the proper state legislative body and propose a bill to amend the Medical Practice Act to allow such "corporate practice" in said hospitals.

This resolution suggests that legislative changes be drafted to approve or condone what is now taking place. This would, therefore, be on the assumption that what is taking place at the present time is illegal. No court decision has ever been handed down to this effect. The Attorney-General's office has repeatedly indicated its unwillingness to reach or render an opinion in this area.

You can find as many proponents of the fact that what is being done is legal as you can opponents. Drafting such a proposed change in the law would be extremely difficult, if not impossible. If such a change were feasible and were adopted by the legislature it would then be subject to various interpretations through court action. It probably would not clarify the situation as it now exists and, in fact, might confuse the current wording of the Medical Practice Act which provides exemption from licensure for certain categories of physicians:

Nothing herein contained shall be construed to apply to . . . any resident or assistant resident physicians or interns or students at hospitals in the discharge of their hospital or dispensary duties.

In addition, it is our understanding that certain medical students, residents, interns, etc., perform part of their postgraduate work in practicing physicians' offices. How would such a change affect these arrangements?

Your Reference Committee, therefore, does not see how this situation can be clarified in a simple, understandable manner. **In the light of this, it recommends that this resolution not be adopted.**

RESOLUTION 2S/66

Submitted on: April 22, 1966

In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL

each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

Introduced by:	George Vash, MD
Subject:	Liaison Committee to Screen all Requisition Forms of Maryland State Department of Health, Bureau of Laboratories, Insurance Companies, and Blue Cross and Blue Shield, so as to Recommend Elimination of Unnecessary Detail

Whereas, The physician has more paper work than is good for him; and

Whereas, The trend of good medical practice is toward more and more laboratory procedures and insurance work; and

Whereas, The requisitions of the Maryland State Department of Health, Bureau of Laboratories, as well as many insurance companies, are unnecessarily cumbersome; be it

Resolved, That the Faculty's Liaison Committee review requisition forms of the Maryland State Department of Health, Bureau of Laboratories, Insurance Companies, and Blue Cross and Blue Shield, so as to recommend elimination of unnecessary detail; and be it

Resolved, That such committee hold hearings where the affected physicians could voice their grievances and make appropriate recommendations.

The general intent of this resolution is good. The form referred to in the third Whereas, with respect to the State Health Department's Bureau of Laboratories, was, in fact, approved by the Faculty's Liaison Committee and several modifications made in it.

The Faculty's House of Delegates in April, 1959, approved a "Simplified Insurance Claim Form." The American Medical Association and the Health Insurance Council also have been active in development of simplified forms. The recently developed Medicare claim form is an example of what can be accomplished in the way of simplicity and condensation of information needed for the processing of claims.

It would seem that the Faculty's Liaison Committee could provide a forum where aggrieved physicians could air their feelings and suggestions for improvements in claim forms. It would also enable an exchange of opinions to be entered into between those making payment under the claims and those who are required to complete such forms.

The Reference Committee, therefore, recommends that Resolution 2S/66 be adopted.

RESOLUTION 3S/66

Submitted on:	May 26, 1966
Introduced by:	George Vash, MD
Subject:	The Medical and Chirurgical Faculty Request the State Health Department to Rescind Its Action in Excluding the Practicing Physician's "Screening Activity" From Use of State Laboratory Facilities

Whereas, Current medical and lay opinion deems it the responsibility of every physician to practice preventive medicine and screen for the earliest signs of curable disease; and

Whereas, The scope of the Maryland Public Health Laboratory, as defined in Section 35, Article 43, Annotated Code of Maryland, 1965 Supplement, is, ". . . to provide laboratory services in screening or surveillance"; and

Whereas, The Commissioner of Health has seen fit on April 18, 1966, to define screening programs as "planned studies, within identifiable population groups toward the detection in early stages of diseases in presumably well people," and to rule, "that test specimens taken by practitioners are not at the present time to be part of the departmental screening program;" therefore be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland considers arbitrary and unlawful the Commissioner of Health's exclusion of the practicing physician's screening activity from the benefits of the Maryland State Department of Health Laboratory Services, and that the Faculty use its offices to persuade the Commissioner of Health to rescind this part of his directive.

The action taken by the State Health Department in its April 18, 1966, communication was unanimously approved by the Faculty's Liaison Committee inasmuch as it was in line with the Faculty House of Delegates policy adopted on September 12, 1958, as follows:

Resolved, That this House of Delegates of the Medical and Chirurgical Faculty recommends to the State Board of Health and the State Health Department that they curtail the activities of the laboratory facilities in fields other than infectious, contagious disease and, specifically, they restrict all other services to patients declared indigent and medically indigent under the Medical Care program of this State, wherever private facilities are available; and

Resolved, That physicians in Maryland be urged to evaluate all referrals to State Health Department Laboratories to insure those able to pay are referred to private laboratory facilities where available.

The Maryland Society of Pathologists has already offered free services to those borderline patients who do not fall within the category of indigent or medically indigent and who are unable to pay for diagnostic tests. All the physician needs to do is to so indicate on the referral slip sent to the laboratory with the specimens or the patient.

Because the current Health Department policy falls into line with previous Faculty policy decisions reached by this House of Delegates and reiterated over the years, the Reference Committee recommends that Resolution 3S/66 be not adopted.

RESOLUTION 4S/66

Submitted on:	June 15, 1966
Introduced by:	Baltimore County Medical Association
Subject:	Development of a Program by Maryland Medical Service (Blue Shield) to Pay Reasonable and Customary Fees to Physicians

Whereas, There is an increasing demand on the part of the health insurance-buying public for the full coverage of fees for professional services; and

Whereas, The implementation of the Medicare Program will undoubtedly further increase the demand for such coverage; and

Whereas, Fee schedules for paid-in-full programs tend to become obsolete as the economy rises; and

Whereas, Most physicians in private practice feel strongly that the most appropriate way to provide such coverage, on an insured basis, is through the medium of programs that make payments for professional services on the basis of reasonable and customary fees for covered services; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland urge the Maryland Blue Shield Plan to develop without delay a program whereby professional fees will be covered on the basis of reasonable and customary charges; and that such program, when developed, be sold as widely as possible to the end that it may supersede existing scheduled fee program to the greatest extent practicable.

This resolution urges Blue Shield to develop a program

why wonder about a drug for your forgetful patient

DECLOMYCIN

DEMETHYLCHLORTETRACYCLINE

activity doesn't stop when dosage does

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE 300 mg FILM COATED TABLETS
are made for b.i.d.

Effective in a wide range of everyday infections—respiratory, urinary tract and others—in the young and aged—the acutely or chronically ill—when the offending organisms are tetracycline-sensitive.

Contraindication—History of hypersensitivity to demethylchlortetracycline.

Warning—In renal impairment, usual doses may lead to excessive systemic accumulation and liver toxicity. Under such conditions, lower than usual doses are indicated and, if therapy is prolonged, serum level determinations may be advisable. A photodynamic reaction to natural or artificial sunlight has been observed. Small amounts of drug and short exposure may produce an exaggerated sunburn reaction which may range from erythema to severe skin manifestations. In a smaller proportion, photoallergic reactions have been reported. Patients should avoid direct exposure to sunlight and discontinue drug at the first evidence of skin discomfort.

Precautions and Side Effects—Overgrowth of nonsusceptible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

Lederle LEDERLE LABORATORIES
A Division of American Cyanamid Company, Pearl River, New York
423-6-4072

whereby it would pay the physician his "reasonable and customary" charges, providing full coverage to the patient, and that Blue Shield sell this program as widely as possible.

Essentially, this is in line with the various actions that have been taken by the Faculty in recent months. Discussions are now taking place to ensure payment of "usual and customary" fees by the State Health Department in the operation of its medical care programs; with the Workmen's Compensation Commission; with other state agencies; and, of course, this is the basis for payment of physicians' fees under the Medicare program that went into effect July 1, 1966.

At the Reference Committee meeting, Mr. Denwood Kelly, the executive director of Blue Shield, stated that on instructions from the Blue Shield Board of Trustees a study is already underway to ascertain the feasibility of such a program. Nevertheless, the representative of the Baltimore County Medical Association and the Reference Committee itself believe that the Faculty should go on record to this effect.

Your Reference Committee, therefore, recommends that Resolution 4S/66 be adopted.

RESOLUTION 5S/66

Submitted on:	June 15, 1966
Introduced by:	Baltimore County Medical Association
Subject:	Payment of Reasonable and Customary Fees for Professional Services under Title XIX of PL 89-97

Whereas, The passage of Public Law 89-97, commonly known as the Medicare Act, amends the Social Security Act by creating, under Title XVIII, a program of health insurance for the aged and, under Title XIX, a program of grants to states for medical assistance programs; and

Whereas, Under both programs it is the clear intent of the Congress that payment for care provided thereunder shall he on the basis of reasonable cost or charges; and

Whereas, Under Title XIX of Public Law 89-97, the state and federal governments are jointly responsible for paying the reasonable cost of the provision of medical care for disadvantaged persons; and

Whereas, Government's assumption of the cost of such care removes the beneficiaries under such programs from the medically indigent category; and

Whereas, It is not the intent of Public Law 89-97 to interfere in any way with the close personal relationships between beneficiaries and their physicians, nor to adversely affect the quality of medical care because of inadequate financing of the cost of such care; and

Whereas, It has been clearly demonstrated in the Military Dependents Medical Care Program that average payments for professional services have been consistently lower in those areas in which such payments have been made on the basis of reasonable and customary charges, without published fee schedules, than in those in which published fee schedules were used; now, therefore, be it

Resolved, That the Medical and Chirurgical Faculty of the State of Maryland, representing the practicing physicians in Maryland, develop with the Maryland State Department of Health, at the earliest possible date, a program of health care for the disadvantaged, under the provisions of Title XIX of Public Law 89-97, under which all payments for professional services shall be on the basis of reasonable and customary charges; and be it further

Resolved, That copies of this resolution be sent to the Governor of the State of Maryland, the Budget Bureau of the State of Maryland, the Maryland State Board of Health and Mental Hygiene, and the Commissioner of Health of the State of Maryland.

This urges development of a program whereby "usual and customary" fees would be paid for services to be provided under Title XIX of PL 89-97 (the so-called Medicare law). Title XIX provides for payment of fees for care rendered under the indigent and medically indigent program that has been in operation in Maryland for many years.

In September, 1965, the Faculty's House of Delegates approved payment of "usual and customary" fees to private practicing physicians rendering care to . . . medical care program patients. In April, 1966, the Faculty's House of Delegates reaffirmed this concept and authorized appointment of a committee to deal with (a) all problems relating to PL 89-97 as it pertains to physicians' services; and (b) to deal with the fiscal intermediary for physicians' fees as they pertain to Title 18 or 19 of this law.

It would seem that this resolution is a reiteration of current Faculty policy, with the additional proviso that various officials in the state government be informed of this policy. The Reference Committee heard and agrees that this is one of the most important pieces of legislation that has come before us in a long time and it is important that we take a stand for the future, and it is therefore imperative to act now.

Your Reference Committee, therefore, recommends that Resolution 5S/66 be adopted.

RESOLUTION 6S/66

Submitted on:	July 12, 1966
Introduced by:	William G. Speed, III, MD, chairman, Fee Schedule Committee
Subject:	Billing on Workmen's Compensation Cases at Physician's "Usual, Customary and Reasonable Fees"

Whereas, The present provisions of the Workmen's Compensation Law, Article 101, Section 37 (c), reads as follows:

> "All fees and other charges for such treatment and services shall be be subject to regulation by the Commission, and shall be limited to such charges as prevail in the same community for similar treatment of injured persons of a like standard of living.";

and

Whereas, The trend today is toward payment of the physician's usual, customary and reasonable fees; and

Whereas, Hospitals throughout the state are permitted to bill carriers or others on the basis of their posted charges, without obtaining permission for any increases in such charges; now, therefore, be it

Resolved, That the House of Delegates of the Medical and Chirurgical Faculty of the State of Maryland go on record as urging its members to submit bills for payment of "usual, customary and reasonable fees" for treatment of Workmen's Compensation Cases, as well as all other governmental agencies.

This resolution, introduced by the Chairman of the Fee Schedule Committee, was prepared after an informal discussion with the representatives of the "Continuing Committee to Study Medical and Surgical Fees Applicable to Workmen's Compensation," a committee named by the Workmen's Compensation Commissioner.

This is in line with the approval of the Council at its June, 1966, meeting when it authorized the Fee Schedule Committee to discuss with the appropriate persons the payment of usual and customary fees under

the Workmen's Compensation Law. This is also in line with current Faculty policy providing for payment of usual and customary fees rather than having fixed fee schedules.

The resolution appears to be one mechanism for publicizing this information to the Faculty membership. It does not appear to be in violation of any antitrust regulations, inasmuch as it does not establish fees per se, but only urges members to bill at the "usual and customary" rates.

Your Reference Committee, therefore, recommends that Resolution 6S/66 be adopted.

The Reference Committee wishes to thank those who took the time to appear before it, as well as the committee members and the office staff for their research and assistance in preparing this report. Your committee also again urges individual members, as well as members of the House of Delegates, to take advantage of the opportunity of appearing at the meeting and expressing themselves on the subjects under discussion.

"'Tranquilizer' is not a good word"[1]

THIS classification is psychologically too seductive, pharmacologically too unspecific, and in terms of results not infrequently untrue."[2]

What is a tranquilizer? According to the 24th Edition of Dorland's Medical Dictionary[3] a tranquilizer is "an agent which acts on the emotional state, quieting or calming the patient without affecting clarity of consciousness."

Defining a drug by its effects, however, can be misleading. The same effects by which the dictionary defines a tranquilizer have sometimes been seen after administration of a sedative — or, for that matter, a placebo.

Ambiguous though the term may be, it appears to be here to stay. The 1966 edition of the Physicians' Desk Reference[4] lists 42 tranquilizers indicated for treatment of anxiety and apprehensive states.

'Tranquilizers' have differences in action, differences in effect

Although all tranquilizers are intended to calm anxious patients there *are* differences in their actions — and in their effects. They have been divided into three categories — the rauwolfia group, the 'minor' tranquilizers, and the phenothiazines.[5]

Although the tranquilizing effect of rauwolfia has been known for centuries, its use as an antipsychotic agent in current practice has diminished.[5]

A 'minor' tranquilizer is often prescribed to achieve more than one effect. Thus, besides being tranquilizers some of these compounds may be muscle relaxants, antihistaminics with some calming action, anticholinergic sedatives, or antispasmodics.[5]

The phenothiazines are considered 'major' tranquilizers because they alter psychotic behavior.[1] This classification may have done them more harm than good because it implies that the phenothiazines should be reserved for the more severely disturbed. This is not necessarily true.

The phenothiazines — and the problem of sedation

One of the problems of prescribing phenothiazines for ambulatory patients has been the fear that excessive sedation will impair the patient's ability to function. This, however, is less of a problem with some of the phenothiazines.

"Clinically they may be differentiated primarily in terms of their potency and the extent of their sedative effect, which appear to be inversely proportional. That is, the least potent, the one which is used in highest dosage, chlorpromazine, is the most sedative, while the reverse holds true for fluphenazine."[6]

In a recent report on various studies conducted over several years evaluating 360 patients treated for anxiety and stress with seven phenothiazines, this inverse relationship of potency to sedation was confirmed.[7] Also under consideration was the degree to which the particular phenothiazines neutralized anxiety (the angolytic index). Interestingly enough there was, again, an inverse relationship. The most sedative of the phenothiazines appeared to be the least active in neutralizing anxiety. Fluphenazine, one of the least sedative, on the other hand, was found to be most effective in relieving anxiety.[7]

RELATIVE SEDATIVE AND ANGOLYTIC INDICES OF PRINCIPAL PHENOTHIAZINES*

DRUG	SEDATIVE INDEX	ANGOLYTIC INDEX	BASED ON STANDARD DOSE OF
Chlorpromazine	100	15	25 mgs.
Triflupromazine	100	15	25 mgs.
Thioridazine	90	17	25 mgs.
Perphenazine	15	25	4 mgs.
Carphenazine	25	25	25 mgs.
Trifluoperazine	3.3	95	2.0 mgs.
Fluphenazine	3.5	100	2.5 mgs.

*adapted from Sainz[7]

Prolixin is therapeutically effective without excessive sedation

When used as a 'tranquilizer' in general medical practice, in many patients Prolixin (Squibb Fluphenazine Hydrochloride) suppresses anxiety, but not normal activity. These two features are of particular importance to patients who must be able to live and work without their normal daily activities being restricted.

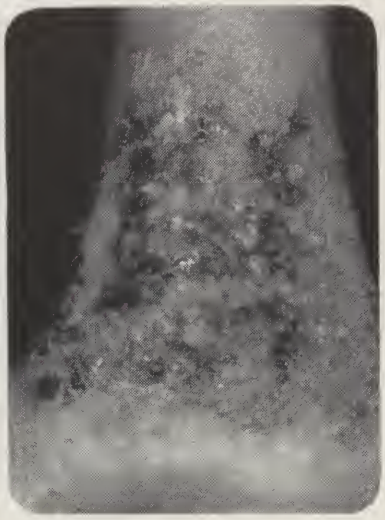
Because of its longer duration of action, Prolixin, in doses of as little as one to three milligrams in adults, generally taken once a day, is effective in maintaining many patients free of their symptoms of anxiety and tension.

Contraindications: Do not use with high doses of hypnotics or in patients with subcortical brain damage. Use with caution in patients with a history of convulsive disorders. Severe reactions may occur in patients with idiosyncrasy to other centrally-acting drugs, and severe hypotension may occur in patients with special medical disorders, e.g. mitral insufficiency and pheochromocytoma.

Precautions: Effects of atropine, anesthetics and C.N.S. depressants may be potentiated. Hypotension may occur in patients undergoing surgery. Do not use epinephrine for treatment of the hypotensive reactions which may appear in patients on phenothiazine therapy.

Side Effects: Extrapyramidal reactions, allergic skin reactions, the possibility of anaphylaxis, drowsiness, visual blurring, dizziness, insomnia, nausea, anorexia, salivation, edema, perspiration, dry mouth, abnormal lactation, polyuria, hypotension, and jaundice and biliary stasis may occur. Routine blood counts are recommended to determine possible blood dyscrasias; if symptoms of upper respiratory infection occur, discontinue drug and institute appropriate therapy.

Available: 1 mg. tablets. Bottles of 50 and 500.



For full prescribing information, see package insert

PROLIXIN®
SQUIBB FLUPHENAZINE HYDROCHLORIDE

SQUIBB 'The Priceless Ingredient' of every product is the honor and integrity of its maker.

eczema: scourge of childhood

R. R., Age 11—Before treatment—atopic eczema of long standing

After treatment—with ARISTOCORT Topical Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of childhood eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Packages: Tubes of 5 Gm. and 15 Gm.; ½ lb. jar.

Chapter 11. Four Revolutions in Medical Care.

"Man individually and collectively will become increasingly dependent upon medicine as knowledge advances, regardless of how medical services are to be organized, practiced, or financed."[1]

This history of the Baltimore City Hospitals is concerned principally with the evolution of the Almshouse into a modern hospital, the social demands and scientific advances which brought about this transfiguration, and the changing attitudes of the community toward Welfare patients. If a revolution differs from evolution by being apparent to contemporary society, it is possible to identify four revolutions influencing medical care in Baltimore since the founding of the Baltimore City and County Almhsouse in 1773. The following revolutions were common to all the larger American cities:

1. *Improvements in Licensure and Medical Education*

Starting in the 1790's, a group of leading practitioners in Baltimore became concerned with the low level of medical care in the city. They were concerned not only with quacks and charlatans who were in practice, but also with education of young doctors. Attempts to establish a state licensure board resulted in legislative action and the founding of the Medical and Chirurgical Faculty in 1799. A number of the physicians interested in improving licensure procedures had participated in the founding of a private medical school in the 1790's under the leadership of Andrew Wiesenthal (1762-1798). The efforts to establish a permanent Medical School in the 1790's were unsuccessful, but opened the way to the founding of the College of Medicine of Maryland in 1807.[2]

This movement toward improvement in the quality of practicing physicians, although essentially a reform movement based on economic considerations, was nevertheless an essential step in the progress of medicine from a trade to an intellectual discipline.

2. *Introduction of the Scientific Method and a Humane Attitude*

In the 1830's and 1840's, the combination of improved physical examination (based on Laennec's work) and history taking, increased correlation of clinical and postmortem findings and the beginning of statistical analysis brought about a revolution in the understanding of disease. This revolution was introduced to Baltimore by Dr. William Power in the years following 1840. A graduate of the University of Maryland School of Medicine in 1835, he had been a student at the Almshouse in 1834. He followed this experience with five years of work in Paris with Pierre Louis. As resident physician at Calverton (the Baltimore City Almshouse in 1840), he introduced careful medical history taking, new methods of percussion and auscultation, proper progress notes, and clinical pathological correlations. This scientific approach to medicine, still the basis of good medical care, flourished at the Almshouse and brought to the inmates the best medical care available in the United States. This major advance was introduced by a single physician who brought to America the foremost scientific ideas

TABLE 1

A TENTATIVE ARRANGEMENT OF SOCIAL AND MEDICAL ERAS SINCE THE OPENING OF THE ALMSHOUSE

	1773-1890	1841-1890	1891-1934	1935-1966	Future Medicine
Economic challenge to Baltimore	Exhaustion by wars of 1776 and 1812; decline in plantation economy	Development of Erie Canal route to west; competition to port of Baltimore	Movement of centers of finance and industry from Baltimore	Economic depression St. Lawrence Seaway	
Response to economic challenge	Development of seaport; land speculation; industry	Development of Baltimore and Ohio Railroad	None	Government financing of health, education and welfare Greater Baltimore development plan	
Political-philosophical atmosphere	Elizabethan	Laissez-faire	Social darwinism	Welfare state	Medicare
Scientific atmosphere	Natural science	Natural science, physical, biological Clinical-Pathological	Natural physical, biological, behavioral	+ Social	+ Preventive medicine + Rehabilitation
Medical teaching 1. Teacher 2. Students	Private practitioners. Private medical school professors Apprentice students	Professors from U. of Md. School of Medicine and College of Physicians & Surgeons Selected full-time clinical clerks	+ Full-time physicians Part-time students from medical schools	Rotating clinical clerks from schools of medicine	Same + Fellows
Public health influence	Major depository of all social problems Development of smallpox vaccination	Care of orphans, insane, infirm.	Development of tuberculosis sanitarium	Baltimore City Infectious Disease Hospital (after closure of Sydenham Hospital)	Hospital-based care programs for chronic diseases
Patient care	Symptomatic treatment	Treatment of disease	Treatment of patient and disease	Treatment of disease; patient and community	+ Primary and secondary prevention
Research	Historical	Clinical-pathological correlations	Beginning of laboratory medicine	1. Clinical 2. Animal laboratory 3. Gerontology unit 4. Social	Gerontology, chronic disease, patient care research
Concept of disease	Polymorphic	Single agent	Agent⟷Host	Agent⟷Host ↕ ↕ Environment	

then being developed in Paris.

Anesthesia, aseptic surgery and new drugs to combat infections, avitaminosis and endocrinopathies are all important scientific discoveries, but had no special development at Baltimore City Hospitals.

Another important advance in medical care during this period was the changing attitude toward patients. Although these attitudes arose in relation to psychiatric patients ("moral treatment"), there is evidence that they were in use at the Baltimore City Almshouse following the year 1829. This theory of psychiatric etiology was based on the belief that insanity was a result of situational, social and genetic factors rather than possession by demons. This humanitarian attitude toward the insane in Baltimore was centered at the Maryland Hospital, located on the present site of the Johns Hopkins Hospital, and apparently was diffused to the Baltimore Almshouse from the physicians in charge. This attitude toward the insane was also an import from France where Phillip Pinel (1755-1826) had crusaded for better treatment for the insane. This is the earliest example of the influence of psychiatric thought on the general care of patients. Later, the influence of Sigmund Freud and Adolph Meyer was to insist that the insane were victims of adverse personal, social and genetic factors rather than sinners persecuted by an unjust God.

3. *Medicine, an Academic Profession*

A third revolution was the removal of the laboratories from the wards into the university research unit where body fluids and tissues could be studied and analyzed. Although this separation of the physician and the laboratory man has brought on some of the difficulties of specialization (and interest in the laboratory results rather than in the patient), it nevertheless brought the diagnosis of disease into a scientific and intellectual setting, with a result of untold improvement in medical treatment. At the Bay View Asylum, this influence was stimulated by the founding and interest of the Johns Hopkins Medical School.[3] The research laboratory itself had originated and flourished in the German medical atmosphere of the late 19th century.

In the same way that the clinical laboratory was incorporated into the academy, so the training of the physician was removed from the proprietary school into the university medical school. Physicians were not to be practitioners only; they must also be scholars learning how to approach new and unexpected problems, rather than mastering the booklearning and lectures appropriate to the past.[4]

4. *The Revolution of Rising Expectations*

The present revolution is both social and scientific. It is a revolution in the demand for the fruits of recent medical research. It is to be paid for by the federal government. It differs from the three previously discussed revolutions (which were largely narrow reform movements within the medical community to meet obviously acute existing problems) in that its impetus comes from political sources and looks toward the future. It has some of the features of previous revolutions in that it takes on a specific pragmatic American form, but originated in Europe (Germany, Scandinavian countries and Great Britain). Whether manifest in Medicare, in the Heart Disease, Cancer and Stroke Program, or in the many slogans of charitable health organizations, public opinion is informed by a belief that medical care can actually perform miracles in maintaining or improving health, and that it is not doing so. There is the assumption that all that is needed to accomplish these miracles is sufficient money.

These assumptions are, at best, debatable; that there is a revolution of rising expectations in regard to medical care can hardly be denied.

What is the Source of These Expectations?

A. In a previous chapter we have quoted L. J. Henderson's estimation that it was not until around 1912 that a random patient with a random disease consulting a randomly selected physician stood better than a 50-50 chance of benefiting from the encounter. But even these odds were based on solid and often brilliant achievement. Public health measures had shown that it was possible to eliminate or control many diseases dependent on vectors or water pollution. Vaccines, serums, antitoxins and a few chemotherapeutic agents had been proved to be potent. Surgery could be performed safely and painlessly.

But these advances did not affect the average person in his everyday life. Preventive measures do not solve individual problems. Medicine, however brilliant its accomplishments, still was in-

Night Leg Cramps...
Frequent Bedfellow in Diabetes, Arthritis, and Peripheral Vascular Disorders*

*"Nocturnal cramps occurring in the calf muscles and small muscles of the feet have been encountered in a significant number of diabetic patients."[1]

". . . nocturnal cramps may be the presenting symptoms of patients with arteriosclerosis obliterans, deep thrombophlebitis, varicose veins, osteoarthritis . . ."[2]

now...specific therapy for night leg cramps

QUINAMM™

Consistently effective, QUINAMM provided complete relief in 94% of 200 patients studied, many of whom were severe cases refractory to other medication.[3] Your prescription for one tablet at bedtime often controls painful night cramps with the initial dose . . . helps restore restful sleep.

QUINAMM Composition: Each white, beveled, compressed tablet contoins: Quinine Sulfote 4 grains (250 mg.), Aminophylline 3 grains (200 mg.). **Precautions:** Aminophylline moy produce intestinol cromps in some instances, and quinine may produce symptoms of cinchonism, such os tinnitus, dizziness, ond gostrointestinol disturbance. Discontinue use if ringing in the eors, deofness, skin rash, or visual disturbances occur. **Contraindication:** QUINAMM is contro-indicated in pregnoncy becouse of its quinine content. **Dosage:** One toblet upon retiring. Where necessory, dosoge moy be increosed to one toblet following the evening meol ond one toblet upon retiring. **Supplied:** Bottles of 100 ond 500 toblets. **Caution:** Federol low prohibits dispensing without prescription. **References:** 1. UP TO 10–12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

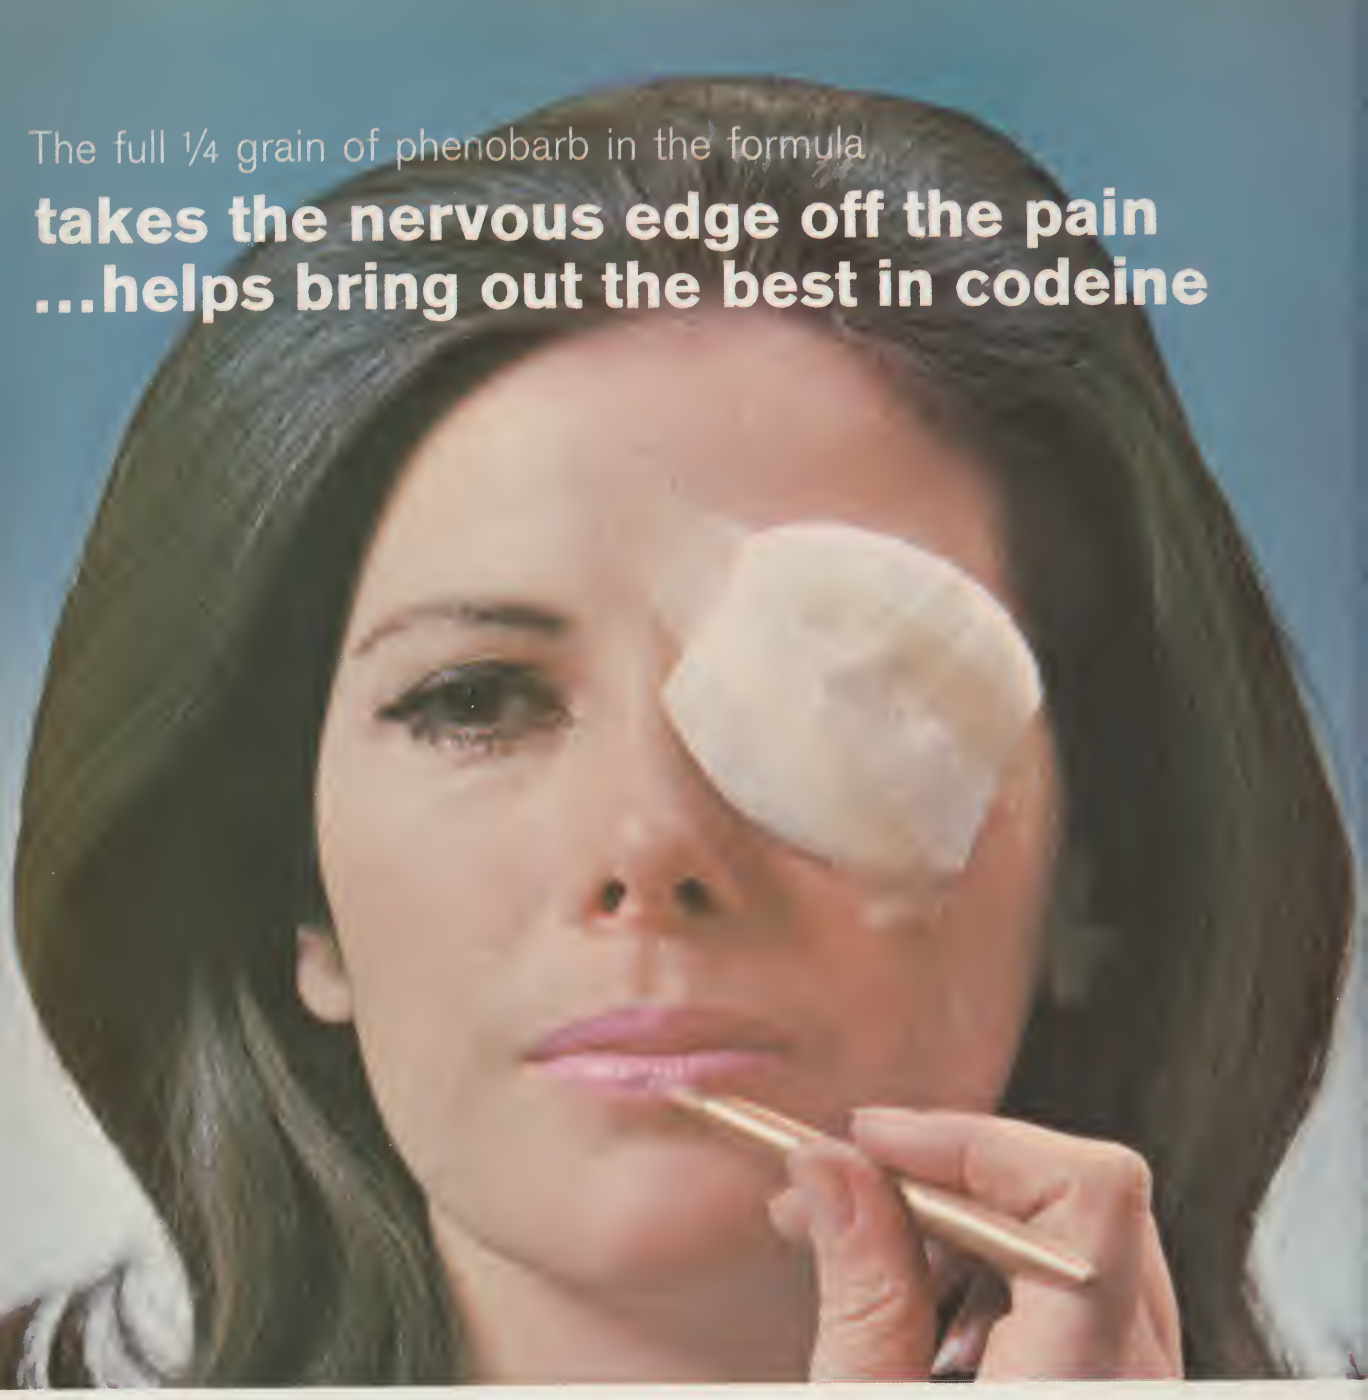
In sinusitis, colds, or U.R.I., Dimetapp lets congested patients breathe easy again. Each Extentab brings welcome relief all day or all night, usually without drowsiness or overstimulation. Its key to success? The Dimetapp formula—Dimetane (brompheniramine maleate), a potent antihistamine reported in one study to have elicited side effects as few as the placebo,* teamed with decongestants phenylephrine and phenylpropanolamine—in a dependable 10- to 12-hour form.

*Schiller, I. W., and Lowell, F. C.: New England J. Med. 261:478, 1959.

Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.



Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.

Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

formed by the age-old caution *primum non nocere*—do not get in the way of nature.

Dr. William Welch (1850-1934), under the influence of Julius Cohnheim (1839-1884), was one of the first to articulate[5,6] the new philosophy that nature alone does not always cure, and that actually the reparative response to disease may be deleterious to the organism as a whole. "The agencies employed by nature may be all that can be desired; they may, however, be inadequate, even helpless, and their operation may add to existing disorder. There is ample scope for the beneficent work of the physician and surgeon."[5] This new attitude opened the way to an activist approach to treatment.

Following the 1920's with the discovery of a treatment for pernicious anemia, of vitamins, insulin and, above all, the antibiotics, there has been a crescendo in the ability to cure infections, replace absent hormones, and supply needed vitamins. Nor has the surgeon been completely satisfied with the treatment of diseases. Plastic, orthopedic and cardiac surgeons have advanced into the fields of repair, reconstruction and prevention.

Most of these advances in activist medicine have been centered in the hospital. Furthermore, they affect a large number of people in their daily lives, with increasing emphasis on return to work. The hospital has indeed become an important community resource.

B. But the hospital solves other problems than those of strictly medical concern. Increasingly the domiciliary and financial problems of the chronically ill will be thrown on the hospitals. Even for

TABLE 2
HOW THE STATE OF MARYLAND GRADUALLY TOOK OVER RESPONSIBILITY FOR COMMUNITY NEEDS ORIGINALLY MET BY ALMSHOUSE

Date	Community need met by Almshouse	Year in which State took some responsibility	Year in which State took major responsibility	Where

the patient who cannot be cured or radically improved, the hospital is expected to rehabilitate, comfort, house and give continuous medical care. "Social" admissions to hospitals are increasing. Families having an older generation in the household are increasingly depending on hospitals to admit and take responsibility when there is a space, social or nursing problem. As hospitalization becomes a right, paid for and directed by the federal government, there will be increasing pressure to hospitalize patients for social and nursing needs. These demands will perhaps fall most heavily on municipal and state hospitals which are already set up to care for the social problems of the elderly and chronically sick.

The two Tables in this discussion attempt to summarize some of the factors influencing medical care at the Baltimore City Hospitals. They have been compiled with much oversimplificaton. Table 1 attempts to place medical care at the Baltimore City Hospitals among the wider financial, cultural, philosophical and medical trends of the times.

Table 2 is an equally oversimplified attempt to show how the multipurpose Almshouse developed into a hospital as the State of Maryland took over many of the non-hospital functions. Not mentioned in Table 2 is the fact that in 1962 most of the pauper infirm (ambulatory) were transferred to nursing homes to make room in the former Infirmary for patients with chronic diseases. The Baltimore City Welfare Department now has the responsibility of housing foundlings and orphans (foster children), although the Baltimore City Hospitals still has the responsibility of giving them medical care.

Initially the State of Maryland took the responsibility for inmates of the Almshouse by moving various groups out to different institutions. With the Kerr-Mills Act and Medicare, the State of Maryland assigns funds for care of patients within the Baltimore City Hospitals.

STOP anxiety

but not your patient

For your anxious patients who must remain active, 'Stelazine' offers a specific, incisive antianxiety effect that can calm excessive anxiety without producing annoying dulling effects. On 'Stelazine' patients react more normally to stresses and at the same time remain alert enough to carry on their normal activities.

Stelazine®

brand of **trifluoperazine**

Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR*. The following is a brief precautionary statement. *Contraindications:* Comatose or greatly depressed states due to C.N.S. depressants and in cases of existing blood dyscrasias, bone marrow depression and liver damage. *Precautions:* Use with caution in angina patients and in patients with impaired cardiovascular systems. Antiemetic effect may mask symptoms of other disorders. An additive depressant effect is possible when used with other C.N.S. depressants. Prolonged administration of high doses may result in accumulative effects with severe C.N.S. or vasomotor symptoms. Use in pregnant patients only when necessary for the patient's welfare. *Side Effects:* Occasional cases of mild drowsiness, dizziness, mild skin reactions, dry mouth, insomnia and amenorrhea. Neuromuscular (extrapyramidal) reactions (motor restlessness, dystonias, pseudo-parkinsonism) may occur and, in rare instances, may persist. In addition, muscular weakness, anorexia, rash, lactation, hypotension, and blurred vision have been observed. Blood dyscrasias and cholestatic jaundice have been extremely rare. For a comprehensive presentation of 'Stelazine' prescribing information and side effects reported with phenothiazine derivatives, please refer to SK&F literature or *PDR*.

MARYLAND SOCIETY OF PATHOLOGISTS INC.

ROBERT G. LANCASTER, M.D., PRESIDENT
W. BRADLEY KING, JR., M.D., SECRETARY
MITCHELL ROSENHOLTZ, M.D., CHAIRMAN, EDITORIAL COMMITTEE

Pathologists, Hospitals and Society: A Pathologist's Plea for Necessary Autonomy

JOHN E. ADAMS, MD
Chief of Pathology
Greater Baltimore Medical Center

In recent months pathologists seem to have been the object of growing dissatisfaction among the lay public as well as the medical profession generally, dissatisfaction originating from uncertainty as to our interests and motives. The advent of Medicare, its accompanying regulations concerning laboratory service, and our desire to protect and preserve pathology as a specialty practice of medicine have made it necessary to state our position, needs and desires repeatedly. Not a little notoriety has occurred with the lodging this year of an antitrust suit against pathologists and our professional societies. It seems appropriate, therefore, to attempt to explain our position and to correct some of the misconceptions arising from these events, for it is apparent that many of our problems, motives and goals have not been made clear to the rest of the profession. Perhaps if a measure of insight into some of these problems is attained, the rest of the profession will support pathology and pathologists more vigorously in this difficult period. This support will be most opportune, since there is ample evidence at this time to suggest that the fate of pathology will presage the future of medical practice in this country.

Most pathologists who have responsibility for a broad based, non-private laboratory service are interested in at least some degree of autonomy. The desire for autonomy at times has been equated with a desire for increasing personal gain. It cannot be guaranteed that this motive is non-existent, but there are many more important reasons why a degree of autonomy is essential to the satisfactory practice of pathology. Pathologists are subject to many opposing pressures from other physicians and hospital administrations. While hospital administrations demand economical practice and require evidence of rapid amortization, clinicians require a broad base of accurate and rapid service, together with an ever increasing scope of operation. It is difficult in the average hospital to increase scope to include more expensive and less popular tests because the necessary equipment and personnel are difficult to justify economically. In this period of rapidly rising hospitalization costs, administrations are necessarily preoccupied with per diem costs and a balanced operating budget. Understandably, they are not easily enamored of the idea of supporting activities in a semi-research or fiscally unsound category.

Satisfactory laboratory service begins with the collection of a specimen and ends with a legible report on the patient's chart in a short period of time. Between these limits are myriads of intermediate and ancillary services upon which the pathologist must depend and over which, in most

cases, he has a highly variable, and far less than complete, control. With respect to sources of problems, the actual performance of the tests assumes secondary importance. If there is a breakdown in any of the steps between specimen collection and test reporting, the pathologist's effectiveness is jeopardized, notwithstanding that many of the intermediate steps may be beyond the pathologist's control. When a test cannot be completed because a line of supply is disrupted, personnel are unavailable or a piece of equipment is not on hand, the pathologist must assume responsibility for a defect in laboratory management. He therefore must be concerned with as much autonomy as he can attain, since he must otherwise assume total responsibility without total control.

One prime motivation for seeking a career in medicine is independence, with the ability to direct one's own course under minimal outside influence. Most physicians jealously guard this degree of independence and sacrifice considerably in other areas in order to attain and preserve it. Pathologists are no different from other physicians in this regard. A considerable sacrifice of independence is involved in the practice of pathology, which pathologists must be willing to accept as inherent in the practice. Yet at the same time, we should not be unduly criticized for attempting to seek as much independence as possible. I expect that if a satisfactory degree of autonomy were allowed the average pathologist, he would be delighted to have his financial arrangements and records examined by anyone who might care to look.

Other current criticisms are that pathologists have attempted to keep laboratory costs at an artificially high level and that they have tended to stifle competition from nonpathologist-directed laboratories by tacit internal trust agreements. It is true that pathologists believe laboratories dealing in the diagnosis of human disease should be directed by a physician who has special training in such supervision and that other direction may carry risks which are unnecessary and unwise. This is no different from the belief of most physicians that each specialty is best practiced by physicians trained in that specialty. It is as difficult to consider this belief in pathology as a trust as it is to consider every specialty practice as a trust. The concept has been misconstrued because of the business aspect of the practice of pathology.

Through the years, it has been the custom of hospitals to assign unrealistically low values to the cost of various phases of hospital care such as the patient room, nursing, and other ancillary services, while depending upon pathology and radiology laboratories to provide a margin of profit sufficient to balance the books. Reimbursement by major hospitalization insurance plans is largely geared to this concept. Hospitals cannot agree to the lowering of laboratory charges to more appropriate levels without raising the costs of other hospital services. Insurers are not yet ready to accept the concept of strict cost accounting of all hospital services and hospitals are powerless to correct the situation until the insurers can cooperate. Until insurers are able to readjust their reimbursement methods to allow hospitals to assign true cost figures to the cost of the various patient care services, pathologists will be powerless to reduce the cost of laboratory tests. Pathologists for years have been anxious to escape from the yoke of supporting other hospital services, but until cost accounting procedures are instituted and insurance reimbursement is adapted to this concept, laboratory charges will not come down.

One accurate definition of a satisfactory practice of pathology is laboratory service provided with all possible speed, accuracy and at the lowest possible cost to the patient. Pathologists accept this definition as their major aim; however, without a degree of autonomy sufficient to control most operations upon which the laboratories are dependent, and freedom to set laboratory charges at their true value without a built-in profit margin to carry other hospital services, pathologists will be unable to achieve this goal.

A journal within a journal published quarterly in the interests of better medicine by Dorsey Laboratories, a division of The Wander Company, Lincoln, Nebraska. Address communications to Raymond C. Pogge, M.D., Director of Medicine.

this issue: the common cold and the aging patient

the common cold and the aging patient

Louis J. Vorhaus, II, M.D., F.A.C.P.

G. SCHWENK

Effects of aging on the anatomic and physiologic aspects of the respiratory apparatus.

The chest becomes more fixed, less mobile and less elastic as the bronchial walls and thoracic ligaments lose elasticity. The diaphragm and intercostal muscles atrophy and weaken. The lungs become smaller, flabbier and weigh less, decreasing vital and total lung capacity, increasing residual volume and the alveolar dead space.

Sir William Osler described pneumonia as the welcome friend of the aged patient, because the patient with pneumonia usually died quietly. But today, the well-informed physician is an even better friend of the aging patient, since it is better to live than to die, no matter how quietly.

One of the first avenues of approach in the control of the hazards of respiratory disease in the aging patient is prompt and proper attention to the common cold or upper respiratory infection. The common cold may be the first step in the relatively short path to lower respiratory infection, broncho-pneumonia and death. This train of events occurs frequently among older persons. Indeed, pneumonia is one of the most common causes of their admission to hospitals and ranks high on the list of geriatric killers. Colds are more debilitating in elderly people and the aged are more likely candidates for secondary infections such as sinusitis and bronchitis. These infections, in turn, are more prone to lead to bronchopneumonia, because of lowered resistance and anatomic and physiologic changes in the lungs of the elderly.

What is different about the respiratory tree of an aged person and that of an otherwise healthy younger adult? Aging certainly takes its toll on all parts of the body, affecting both anatomic and physiologic aspects of the respiratory apparatus. These changes are in part due to the wear and tear that occurs over the years; the repeated bouts of respiratory infection, long exposure to atmospheric pollutants, to occupational inhalants, smoking, malnutrition, obesity, inactivity and the development of other diseases which may affect the lungs.

With the passage of years, the lungs change. They become scarred and emphysematous and lose their compliance. The whole chest becomes more fixed, less mobile and less elastic.

The anatomic changes that occur in aging render the lungs less efficient. Tests of pulmonary function in senescence show a deterioration characterized by a decrease in vital capacity and total lung capacity, an increase in residual volume and alveolar dead space. Maximum breathing capacity is reduced and uniformity of ventilation deteriorates. These problems are often aggravated by the obstructed breathing, fever and secondary infection associated with the common cold, placing an additional stress on the entire cardiopulmonary reserve.

In addition, the efficiency of a cough is below par in older persons even though they are in good health. This is partly due to the decreased respiratory excursions and distensibility of the chest wall, and partly from loss of elasticity of bronchial walls which tend to make them collapse in a cough.

The elderly patient's resistance to infection is often reduced. Nutritional deficiencies are more common in aged people. There is some evidence to indicate that their capacity to respond to stress is less efficient. Finally, there is often relatively meager symptomatic response to acute disease. The absence of obvious or dramatic clinical signs and symptoms of severe illness is particularly dangerous because, coming as it

(concluded on following page)

it's a comforting thing to know

For postnasal drip, clogged ears and stuffed and runny noses

Triaminic® timed-release tablets

keeps patients comfortable 'round the clock. 24-hour decongestion on just a single tablet dosed morning, mid-afternoon and at bedtime. Patients regain senses and can breathe, smell and taste again.

Triaminic. Isn't that a comforting thing to know?

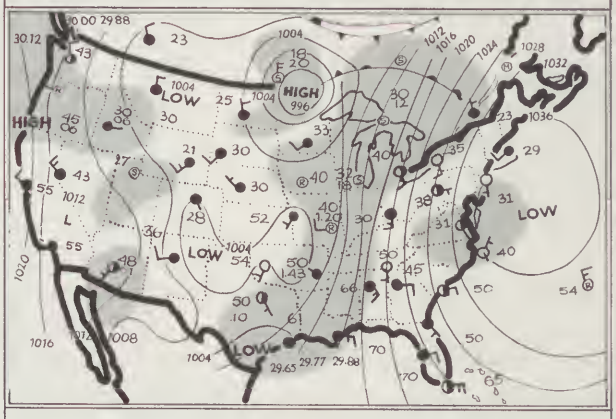
Each timed-release tablet contains:

Phenylpropanolamine hydrochloride	50 mg.
Pheniramine maleate	25 mg.
Pyrilamine maleate	25 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

(Advertisement)

does in a person whose defenses are weakened both locally and systemically, pulmonary disease may progress rapidly to irreversible stages before medical attention is sought. Respiratory infection is especially hazardous because the aged patient responds badly to hypoxia. Not only is his response to oxygen lack impaired, but the work of breathing, due to decreased compliance of the lung and increased stiffness of the thorax, is markedly augmented.
Many patients late in life are in a precarious and delicate cardiopulmonary balance which is easily decompensated from relatively minor insults such as colds and upper respiratory infections.



For all of these reasons, geriatricians long have stressed the importance of preventing respiratory insults. Today we have better ways of treating respiratory infection, improved techniques for clearing the lungs and bronchial tubes of secretions and better understanding of ways of improving ventilation. We possess a broader spectrum of antimicrobial agents including newer ones to deal with previously resistant organisms. Even so, the death rate from pneumonia is high in older people, and it is preferable to avoid the disease than to treat it. To do so, attention must be paid to the general maintenance of good health and all that implies, as well as to the prevention, elimination and treatment of associated conditions that predispose to or cause pneumonia such as chronic upper or lower respiratory infection, respiratory allergy, chronic sinusitis and exposure to inspired irritants.

Colds and other minor respiratory infections, which favor the development of broncho-pneumonia, should be treated vigorously and promptly, particularly those patients whose aging process has been accompanied by the development of chronic pulmonary disease. Upper respiratory passages should be cleared with decongestants. Sinuses should be drained adequately. And, when indicated, appropriate antimicrobial therapy should be instituted before serious infection of the lower respiratory tree supervenes.

In decades past it was understandable that physicians welcomed pneumonia for the aged patients because it offered them a quiet and peaceful demise. Today we recognize that in many cases, peaceful as it may have been, such deaths were often avoidable. With the current knowledge and understanding of the problems that respiratory infections impose on aging people, vigilant medical attention can often restore them to a vigorous, rewarding and productive life so that the many opportunities that exist today for people to enjoy their golden years are realized and not stolen by untimely death.

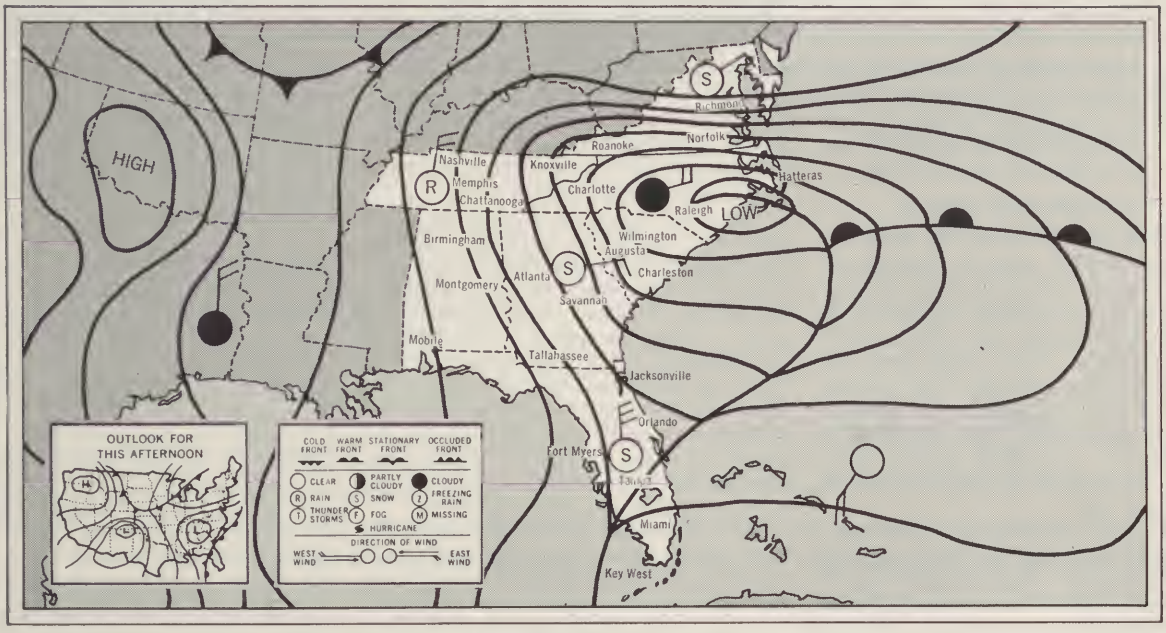
Weather Forecast Throughout the Nation

RAIN TURNING TO SNOW, INCREASING WINDS AND DROPPING TEMPERATURES FOLLOWED BY COUGH, CONGESTION AND PAIN

Tussagesic® provides up to 24-hour coverage of the tough cold with a single timed-release tablet dosed morning, midafternoon and at bedtime. Coughs are broken up, runny and stuffed noses are cleared and pain is relieved.

Each Tussagesic® timed-release tablet contains:



Triaminic® (phenylpropanolamine hydrochloride 25 mg.; pheniramine maleate 12.5 mg.; pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Side effects: Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. Precautions: Patient should not drive a car or operate dangerous machinery if drowsiness occurs. Except under professional care, do not give to patients under 12 yrs. or those who have persistent cough, high fever, heart or thyroid disease, hypertension or diabetes or use for more than 10 days.

MOLECULAR REMODELING—

laboratory exercise or clinical necessity?

More than twenty-five years have passed since the discovery of the diuretic activity of sulfanilamide started pharmacologists on a succession of molecular remodelings to find the ideal diuretic.

Diuresis—a sought-after clinical effect from an unwanted side effect

It started in 1937 when a clinician reported that the administration of a sulfonamide was sometimes accompanied by an unexplainable side effect—metabolic acidosis.[1] Three years later the side effect was explained. The sulfonamide radical of sulfanilamide inhibited carbonic anhydrase,[2] the enzyme responsible for converting carbon dioxide and water to hydrogen ions and bicarbonate ions.

Later, other investigators showed by dog experiments that metabolic acidosis probably resulted when the inhibition of carbonic anhydrase upset the exchange of hydrogen and sodium ions, causing increased excretion of sodium as the bicarbonate.[3]

It was twelve long years after the first report of the unexplainable side effect (metabolic acidosis) that it was finally shown that large doses of sulfanilamide administered to edematous patients were indeed capable of promoting diuresis.[4] However, the possibility of toxic effects from its prolonged use and its relatively weak diuretic action made it impractical for clinical use as a diuretic.[5]

Because the inhibition of carbonic anhydrase seemed to be the key to effective diuresis, investigators began to look for more potent enzyme inhibitors—in the hopes that they would be more effective diuretics.

The most important of these early compounds, acetazolamide, enjoyed several years of fairly wide clinical use.

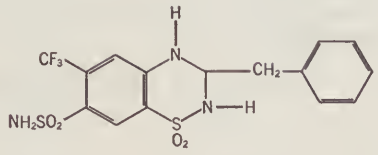
Its carbonic anhydrase inhibitory activity was several hundred times greater than that of sulfanilamide.[6] The increase in inhibitory activity, however, increased not only the excretion of sodium and bicarbonate ions, but also the excretion of potassium.[7] And, like its predecessor, acetazolamide precipitated mild acidosis. Its prolonged use could result in hypokalemic acidosis.[7]

The 'thiazides'—an answer to the metabolic acidosis caused by carbonic anhydrase inhibition

Despite the fact that the sulfonamide group appeared to be responsible for carbonic anhydrase inhibition which in turn appeared to be responsible for diuresis, investigators began to synthesize compounds with structural alterations to the sulfonamide group.

The first major breakthrough came with the synthesis of chlorothiazide. Altering the sulfonamide group did indeed alter the ability of chlorothiazide to inhibit carbonic anhydrase—it was only 1/10th as potent as acetazolamide in inhibiting the enzyme.[8] Despite the drop in inhibitory potency, however, chlorothiazide proved to be an effective diuretic—an observation that led to the conclusion that its diuretic action was due to some mechanism other than its action on carbonic anhydrase.[9, 10]

For effective diuresis, chlorothiazide was administered in daily dosages ranging from 250 to 2000 mg.[11] It increased the excretion of sodium and chloride; and, to a lesser extent, potassium and bicarbonate.[11] The excretion of potassium appeared to be maximal at higher dose levels at which, theoretically, the carbonic anhydrase inhibitory effect is more active.[11] Its prolonged use, therefore, could sometimes result in metabolic hypokalemic, hypochloremic alkalosis.[7]



Naturetin—effective diuresis with more favorable electrolyte balance

Other thiazides followed—with improvements being aimed at two particular areas: 1. attempts to increase diuretic action in relation to the milligram potency of the drug, and 2. attempts at a more favorable sodium/potassium ratio in the urine, i.e., to decrease the excretion of potassium while maintaining the excretion of sodium.[12]

One of these, Naturetin, Squibb Bendroflumethiazide, has made advances on both these points. "By adding a 3-benzyl radical to hydroflumethiazide a rather dramatic reduction in dose range is accomplished. With this drug, effective sodium excretion is obtained with doses between 2.5 and 10 mg., which is a 200 to 1 ratio as compared to chlorothiazide..."[13]

Moreover, due probably to its virtual lack of carbonic anhydrase inhibition, Naturetin (bendroflumethiazide) has been shown to cause less potassium and bicarbonate loss and less alteration in urinary pH than either chlorothiazide or hydrochlorothiazide.

Naturetin is outstandingly effective not only in establishing, but also in maintaining, excretion of retained fluid in edematous patients. And its duration of action is sufficiently prolonged to allow a single daily administration in most patients. Naturetin is also an effective antihypertensive agent.

Contraindications: Severe renal impairment; previous hypersensitivity.

Warning: Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting, or G.I. bleeding occur.

Precautions: The dosage of ganglionic blocking agents, veratrum, or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Electrolyte disturbances are possible in cirrhotic or digitalized patients.

Side Effects: Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, and rashes may occur.

Supplied: Naturetin (Squibb Bendroflumethiazide) 5 mg. and 2.5 mg. tablets. Also available Naturetin c K [Squibb Bendroflumethiazide (5 or 2.5 mg.) with Potassium Chloride (500 mg.)]. For full information, see Product Brief.

GROWTH FAILURE

MILTON S. GROSSMAN, MD
Assistant Professor of Pediatrics
University of Maryland School of Medicine

The etiology of growth failure is one of the more perplexing problems engendered by the physician who cares for the pediatric and/or adolescent population. In dealing with the adolescent patient, it is imperative to distinguish between delayed adolescence and all other causes of short stature. The patient with delayed adolescence may be a "late bloomer" whose final height will eventually be quite adequate. In this regard a bone age x-ray (as described below) can be most useful. Gruelich and Pyle's Atlas (Stanford University Press, 1959) has prediction tables that enable one to predict final height from the bone age and the current height. Usually, girls menstruate at a bone age of 13. Growth continues until the bony epiphyses fuse (a bone age of 16 for girls and a bone age of 18 for boys). However, sex steroids enhance fusion, causing very rapid maturation of bone in great excess of increments of height. Therefore, it does not make sense to give estrogens or androgens to *short* late bloomers. One can only hasten epiphyseal fusion. Hypopituitary patients in their 20's have been found to be capable of further growth! In my opinion, the use of sex steroids in the treatment of delayed adolescence or short stature of any etiology should therefore be confined to use only by the endocrinologist after a careful endocrinological evaluation.

All endocrine imbalance can positively or negatively influence growth. Hypopituitarism and, sometimes, hypothyroidism are the most insidious forms of endocrine imbalance, in that their presence can easily go undetected for many years sometimes not being suspected until adolescence. More importantly, today both of these entities can be adequately treated—hypopituitarism with human growth hormone (somatotrophin) plus other replacement hormones of animal or synthetic origin, and hypothyroidism with desiccated thyroid. In contrast to all of the other endocrine hormones, only human growth hormone can make humans grow—the animal growth hormones do not work. Therefore, this material is in extremely short supply and can only be obtained through the endocrinologist who obtains it from the National Pituitary Agency in Baltimore. In contrast to the sex steroids, somatotrophin does not increase bone age at all! Ten percent of all causes of growth failure not due to undernutrition (see below) are due to lack of growth hormone. The diagnosis and treatment of hypopituitarism are beyond the scope of this presentation. The specialized techniques involve the measurement of radioimmunochemical growth hormone in millimicrogram amounts in the serum in the fasting state and, after release-provoking hypoglycemia or arginine infusion, involve measurements of thyroid, adrenal, and gonadal function, etc. Unfortunately, these procedures are currently available only through medical school endocrine groups such as those at the five medical schools in the Baltimore-

Washington, DC area.

Short stature can be a by-product of chronic disease of any organ system (ie, liver, kidney, heart, lungs, etc). In the United States the most common cause of short stature is short parents (genetic). In the world, the most common cause of short stature is undernutrition (hypocaloric dwarfism). Hypocaloric dwarfism can result from inadequate nutritional intake (starvation), inadequate intestinal absorption (malabsorption syndromes, disaccharidase deficiency, exudative enteropathies, etc), faulty transport or distribution of essential nutriments (hypoproteinemia, etc), or inadequate metabolism of nutriments by the tissues (glycogen storage disease, etc). Poor growth can result from prenatal influences (ie, intra-uterine growth retardation secondary to placental dysfunction—the "withering-on-the-vine" syndrone), or perinatal influence (ie neonatal anexia, central nervous system bleeding, subdural effusion, etc).

Other causes of poor growth are: (a) congenital bone disorders (ie, chondrodystrophies, metaphyseal dysostosis, estrogenesis imperfecta, etc); (b) multiple congenital anomaly syndrome; (c) chromosomal aberrations, including chromosomal mosaicism (gonadal dysgenesis, etc); and (d) "the garbage-can syndrome" or Powell-Blizzard dwarf. These children have an adequate nutritional intake but a severely disturbed emotional environment. They often test out a hypopituitary child but their perimeters of endocrine function return to normal when placed in a good environment!

While the definitive diagnosis of many of the above causes of growth failure may require elaborate laboratory tests available only in large teaching centers, the most valuable measurements for diagnosis are available to *all* physicians in their offices: these are the careful measurements of age (to the nearest month), height, and weight, *and* the plotting of these measurements on a standard growth curve. A child can sustain no major disease of any organ system without having it reflected in altered growth. The Table illustrates the value of careful repeated measurements and how this data can be interpreted.

In the Table, growth data are compiled on six hypothetical children, five of whom have short stature. This Table should prove to be a useful guide for screening causes of growth failure. Height age and weight age are obtained from standard growth charts, such as in Nelson's Textbook of Pediatrics. Height age is that age (to the nearest month) at which the patient's current height would be in the 50th percentile (ie, one moves horizontally on the growth chart until the 50th percentile is intersected and then reads the age by moving vertically to the age intercept). Weight age is obtained in the same manner. Bone age is obtained by x-ray examination of the skeleton, especially the wrist. The wrist x-rays are compared to standards compiled by Gruelich and Pyle. To use the Table properly, one must realize that bone age is usually read by the radiologist in relation to chronologic age. However, the endocrinologist has found that, clinically, bone age

SCHEMATIC COMPARISON OF CAUSES OF GROWTH FAILURE

	Chronologic Age, Yr	Height Age, Yr	Weight Age, Yr	Bone Age, Yr
"Average"	6 0/12	6 0/12	6 0/12	6 0/12
Genetically short Stature	6 0/12	3 0/12	3 0/12	3 to 6
Hypothyroidism	6 0/12	3 0/12	5 0/12*	0 to 6/12†
Hypopituitarism	6 0/12	3 0/12	3 0/12	2 to 4‡
Hypocaloric dwarfism	6 0/12	3 0/12	1 to 2§	3 to 6
Miscellaneous (ie, gonadal dysgenesis, chondrodystrophy, etc)	6 0/12	3 0/12	3 0/12	3 to 6

*Weight age is greater than height age.
†Bone age is much less than height age.
‡Bone age is usually spread over a two-year period with an average equal to or greater than height age.
§By definition, weight age is much less than height age.

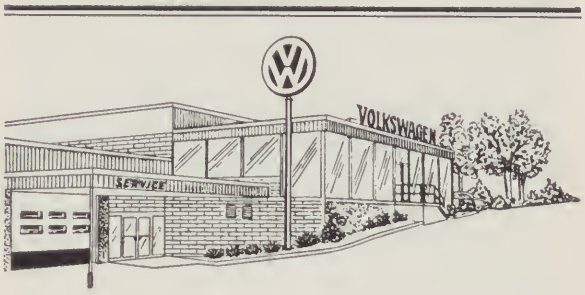
The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score. the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.



If you, too, need a good printer, let's communicate!

is best compared to height age. Therefore, a "retarded" bone age is one that is *less than height age,* independent of chronologic age. An *advanced* bone age, however, is one that is greater than chronologic age, and/or height age, whichever is the greater. Weight age, likewise, makes more sense when compared to height age, not chronologic age.

You will note from the Table that the genetically short child can be quite similar to the hypopituitary child; yet, there are often striking differences. The genetically short child usually looks his *chronologic age,* not his height age, while the hypopituitary child has the proportions and immaturity of appearance of his *height age,* not his actual age. Hypopituitary children are usually two standard deviations *below* the third percentile. Almost no other cause of short stature is so profound.

Many causes of short stature can be treated today, including hypopituitarism. It therefore behooves the physician to carefully weigh, measure, and graph all growing children so that growth failure will be detected as early as possible. Only then will it be possible to be sure that each child has the opportunity to reach his maximum growth potential. In the last analysis, that is the physician's responsibility to each child in his care.

The discomforts of

DIARRHEA
MUCOUS COLITIS
DIVERTICULITIS
SPASTIC URETERITIS
BLADDER SPASM

are relieved by direct musculotropic action with.....

Trocinate®

BRAND THIPHENAMIL HCl

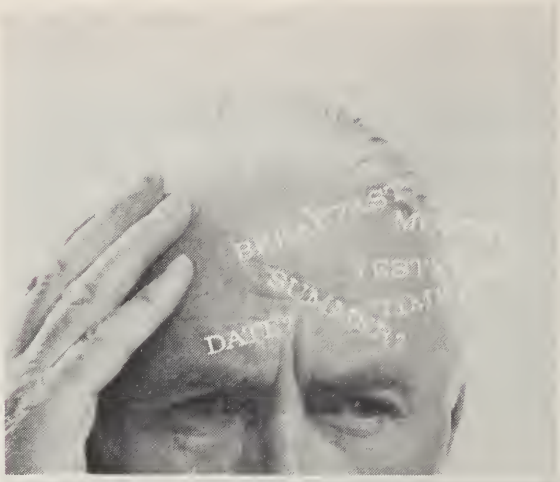
Available in 100 milligram pink sugar-coated tablets.

The high therapeutic index permits dosage sufficient to relieve spasm promptly.

Administer 4 tablets every 4 hours until relief is constant, then adjust maintenance dosage.

Trocinate *BRAND* THIPHENAMIL HCl

Directly relaxes smooth muscle spasm
Combats hypermotility
Non-mydriatic, may be used in glaucoma



Sixteen years of clinical use, with absence of untoward effects, has established the safety and effectiveness of Trocinate.

Trocinate is metabolized in the body and completely eliminated, which is a safety factor. Dosage must be sufficient to maintain the therapeutic blood level.

LEPTINOL

TRADE MARK

When elderly patients display symptoms of apathy, mental confusion, memory lapses... consider LEPTINOL

Leptinol is a useful medication that deters senile mental deterioration by stimulating the cerebral vasomotor and respiratory centers . . . increasing pulmonary ventilation and the supply of blood and oxygen to the brain.

Non-addicting Leptinol also is valuable in long-term treatment, since patients do not establish a tolerance.

Each LEPTINOL bi-layer tablet contains: PENTYLENETETRAZOL, 100 mg., NIACIN, 50 mg., THIAMINE HYDROCHLORIDE, 1 mg., ASCORBIC ACID, 20 mg. DOSE: one or two tablets, 3 times daily. Leptinol produces such a sense of well-being, patients should be cautioned not to exceed recommended dose which offers maximum effectiveness.

Side Effects:—overdosage may produce tremor, convulsions or respiratory paralysis.
Caution should be taken when treating patients with a low convulsive threshold.

Write for detailed literature and starter Leptinol doses.

Alcoholism SECTION

From the Subcommittee on Alcoholism of the Medical and Chirurgical Faculty of the State of Maryland

The Effects of Alcohol on the Brain

"The alcohol withdrawal syndrome, with its complications of tremors, convulsions, hallucinations and delirium tremens, is a direct effect of alcohol on the brain," said Stanley Gitlow, MD, at the annual symposium of the New York Medical Society on Alcoholism in a combined meeting with the National Council on Alcoholism.

Alcohol has two effects on brain function: sedation lasting 5 to 6 hours and psychomotor hyperactivity lasting 12 to 24 hours. Therefore ethanol intoxication has a clinical picture representing the sum of two asynchronous and opposing pharmacological effects.

The term "withdrawal syndrome" is thus somewhat of a misnomer since it defines a primary and direct pharmacologic result of ethanol upon the brain, and the patient may actually suffer from it long before the cessation of alcohol ingestion. The psychomotor hyperactivity becomes apparent within two to five hours after ingestion of alcohol, as the sedative action wanes.

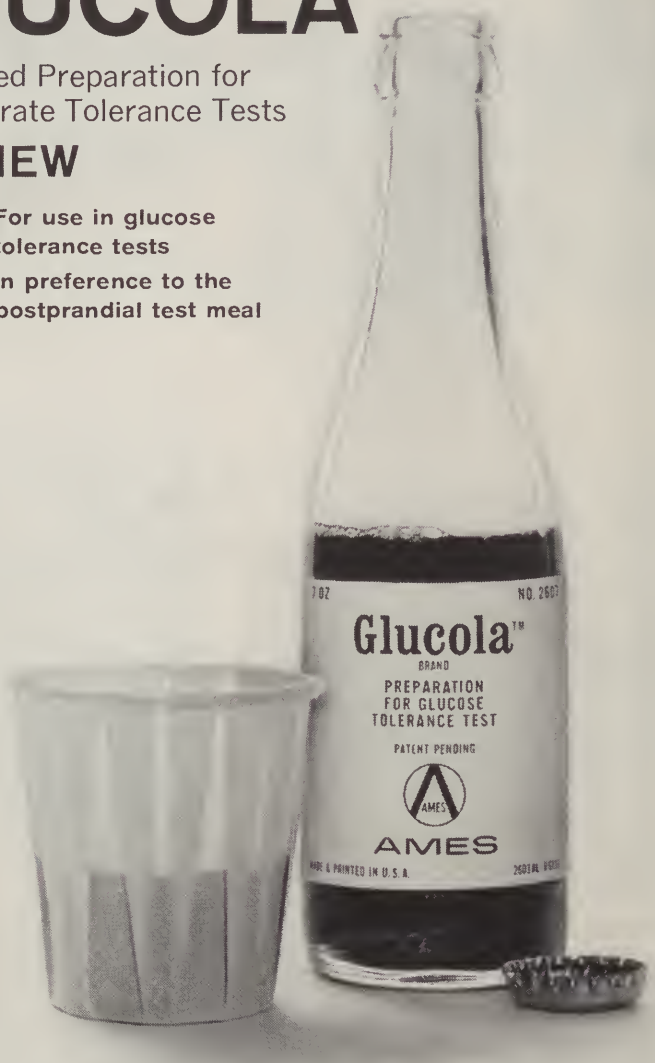
Physicians should be suspicious of the ingestion of other soporifics or of complicating pathology if the alcoholic patient is deeply comatose after that time. In contrast to its sedative effect, Dr. Gitlow said, the psychomotor hyperactivity effect of alcohol is dose-dependent and becomes more prolonged with higher amounts. Recovery from this phase is largely accomplished within three to four days after its onset; complete disappearance of its more subtle characteristics will take weeks.

Phenothiazines are the most useful drugs in controlling the excess psychomotor activity of the withdrawal state; however, they fail to do for the alcoholic what ethanol, barbiturates, chloral hydrate, glutethimide and paraldehyde do "only too well."

In the series of over 1,000 patients treated for alcohol withdrawal syndrome with chloropromazine, Dr. Gitlow declared, not a single instance of intrahepatic cholestatic hepatitis was noted.

He warned against prescribing ethanol during withdrawal to replace other sedatives, since its sedative action is too brief, its psychomotor effect too strong, and its demoralizing effect on the alcoholic pronounced. Patient care is simplified, he said, by the abrupt cessation of ethanol, and the physician's role in reference to the patient and his problem is clarified because the objective is to help the patient attain and maintain abstinence rather than to teach him how to drink ethanol more successfully.

In support of this approach, he reported that when alternate patients were treated with abrupt withdrawal from alcohol versus gradual weaning from alcohol, the incidence of delirium tremens was the same.



This article reprinted from *Physician's Alcohol Newsletter,* Vol I, No 3, by permission of the publisher, The New York City Medical Society on Alcoholism.

GLUCOLA™

Carbonated Preparation for
Carbohydrate Tolerance Tests

NEW

- **For use in glucose tolerance tests**
- **In preference to the postprandial test meal**

A NEW SOLUTION FOR AN OLD PROBLEM

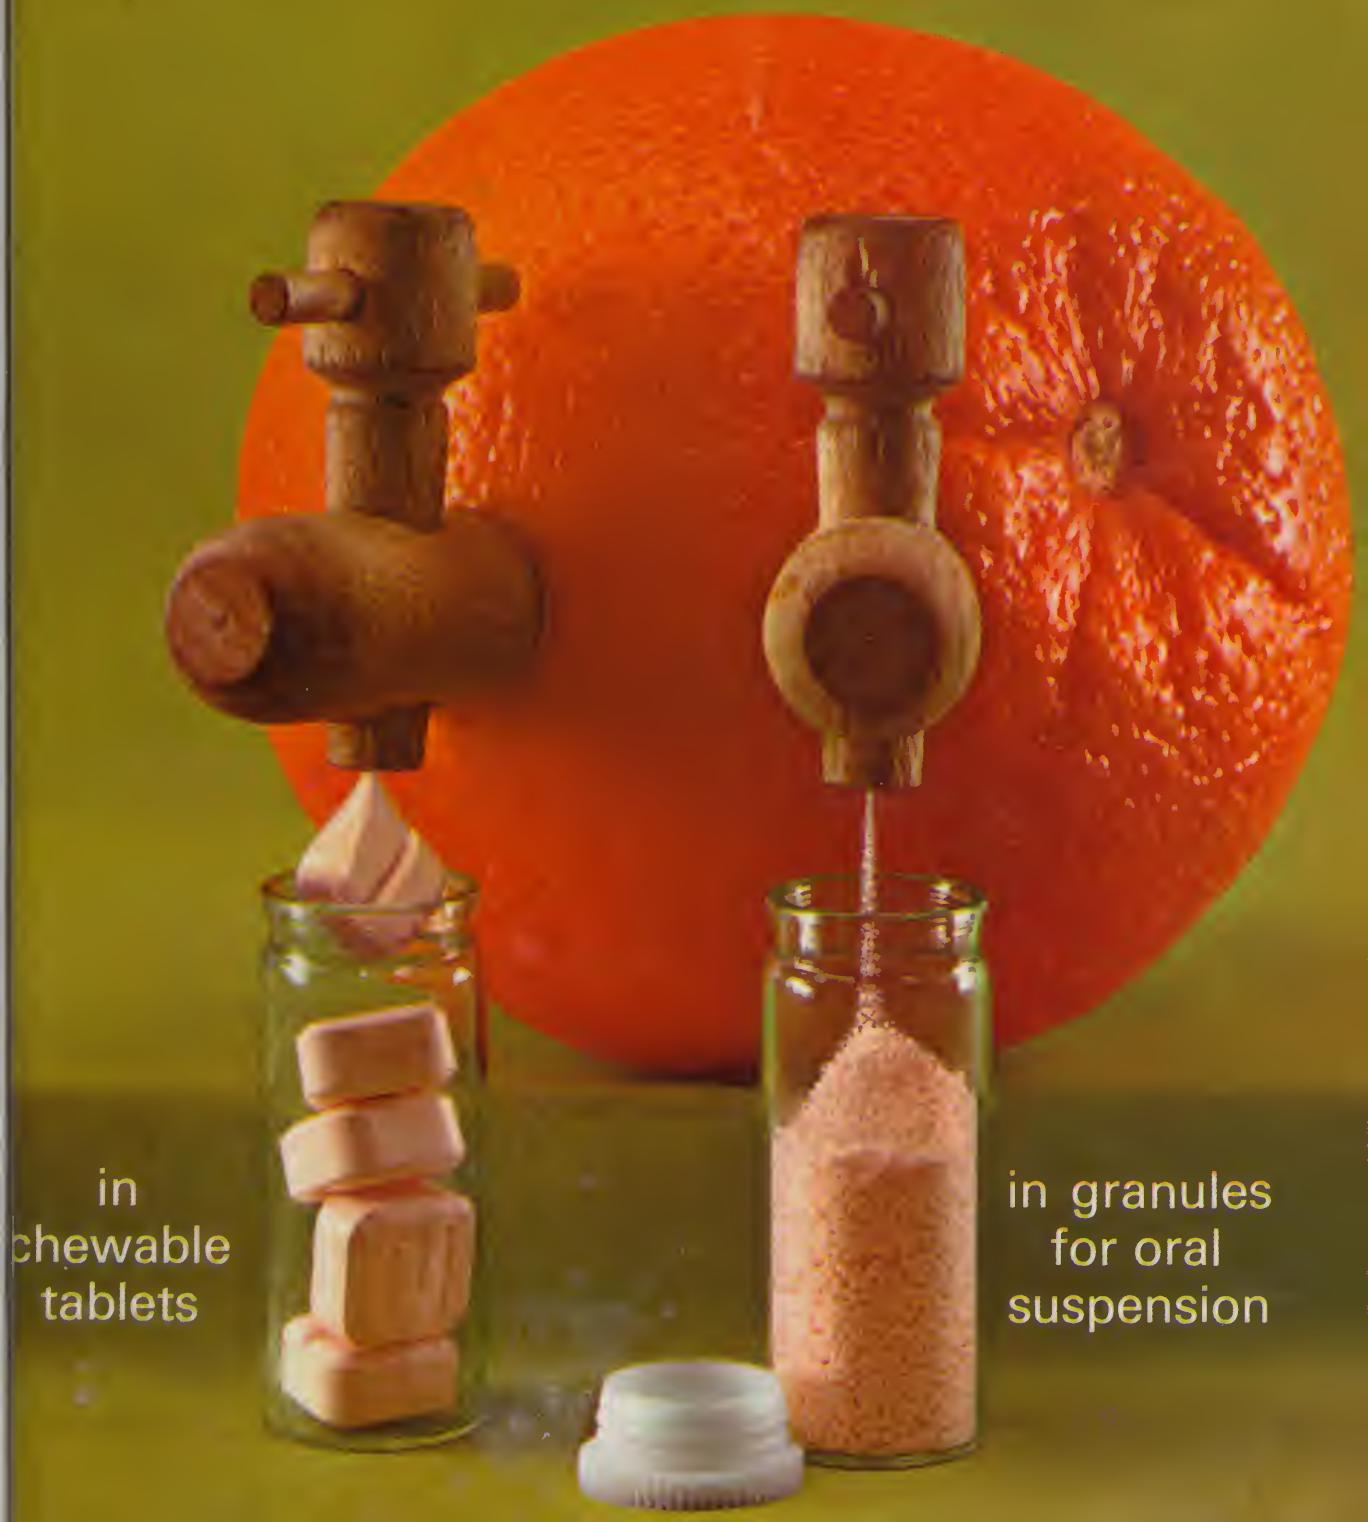
Ready to use • Pleasant tasting cola flavor • Well tolerated

A 7-ounce bottle of GLUCOLA provides a liquid oral loading dose equivalent to 75 Gm. of glucose* for carbohydrate tolerance testing. GLUCOLA avoids the nausea that frequently results from lingering sweet laboratory preparations, and the occasional emesis that necessitates rescheduling the test. With GLUCOLA, no time is lost weighing and mixing glucose "cocktails"—only a bottle opener is needed.

753(R2)64

*The rapidly hydrolyzable saccharides in this formulation assure optimum absorption and glucose levels comparable to those obtained with a 100 Gm. loading dose.

Available through your regular supplier:
cartons of 12 7-oz bottles (6 bottles per pack, 2 packs per carton).



Ames Company, Inc.
Elkhart, Indiana

AMES

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

in chewable tablets

in granules for oral suspension

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets
In Granules for Oral Suspension

ERYTHROCIN®-SULFAS

Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

Butazolidin® alka

phenylbutazone, 100 mg.
dried aluminum hydroxide gel, 100 mg.
magnesium trisilicate, 150 mg.
homatropine methylbromide, 1.25 mg.

Usually works within 3 to 4 days in osteoarthritis

The trial period need not exceed 1 week. In contrast, the recommended trial period for indomethacin is *at least 1 month.*

That's why it's logical to start therapy with Butazolidin alka—you'll know quickly whether or not it works. And usually, it will.

A large number of investigators have reported major improvement in about 75% of cases. Some patients have gone into remission. Relief of stiffness and pain may be followed quickly by improved function and resolution of other signs of inflammation. And Butazolidin alka is well tolerated, especially since it contains antacids and an antispasmodic to minimize gastric upset.

Contraindications
Edema; danger of cardiac decompensation; history or symptoms of peptic ulcer; renal, hepatic or cardiac damage; history of drug allergy; history of blood dyscrasia. Because of the increased possibility of toxic reactions, the drug should be used with greater care in the elderly and should not be given when the patient is senile or when other potent chemotherapeutic agents are given concurrently. Large doses of Butazolidin alka are contraindicated in patients with glaucoma.

Warning
If coumarin-type anticoagulants are given simultaneously, the physician should watch for excessive increase in prothrombin time. Pyrazole compounds may potentiate the pharmacologic action of sulfonylurea, sulfonamide-type agents and insulin. Patients receiving such concomitant therapy should be carefully observed for this effect.

Use with caution in the first trimester of pregnancy.

Precautions
Before prescribing, the physician should obtain a detailed history and perform a complete physical and laboratory examination, including a blood count. The patient should be kept under close supervision and should be warned to report immediately fever, sore throat, or mouth lesions (symptoms of blood dyscrasia); sudden weight gain (water retention); skin reactions; black or tarry stools. Regular blood counts should be made to guard against blood dyscrasias.

Adverse Reactions
The most common adverse reactions are nausea, edema and drug rash. Moderately lowered red cell count may sometimes occur due to hemodilution. The drug has been associated with peptic ulcer and may reactivate a latent peptic ulcer. Infrequently, agranulocytosis, exfoliative dermatitis, Stevens-Johnson syndrome or a generalized allergic reaction may occur and require withdrawal of medication. Stomatitis, salivary gland enlargement, vertigo or languor may occur. Leukemia and leukemoid reactions have been reported but cannot definitely be attributed to the drug. Thrombocytopenic purpura and aplastic anemia are also possi side effects.

Confusional states, hyperglycemia, agitatio headache, blurred vision, optic neuritis an transient hearing loss have been reported, have hepatitis, jaundice and several cases anuria and hematuria. With long-term use, reversible thyroid hyperplasia may occur infrequently.

Dosage
The initial daily dosage in adults is 300-600 mg. daily in divided doses. In most instanc 400 mg. daily is sufficient. When improvem occurs, dosage should be decreased to the minimum effective level: this should not exceed 400 mg. daily, and is often achieved with only 100-200 mg. daily.

For complete details, please refer to full prescribing information.
6509-V(B)

Also available: Butazolidin®, phenylbutazon Tablets of 100 mg.

Aberrant Conduction During Auricular Fibrillation

HAROLD H. BIX, MD
Head, Division of Cardiology
North Charles General Hospital

Aberration is the name which was given by Lewis to designate an abnormal spread of a supraventricular impulse through the conduction system. Aberration gives rise to an altered form of the QRS complex and occurs if an impulse appears in early diastole before the tissue has completely recovered from the previous beat. Aberrant beats, therefore, are very often seen in early premature supraventricular beats, in early capture beats interrupting A-V dissociation and in some other conditions, such as in the first beat initiating a supraventricular tachycardia and in beats ending the shorter ventricular cycle in 3:2 A-V block etc.

The occurrence of aberration depends on the state of relative refractoriness, which in turn is influenced by the length of the preceding cycle, ie, by the heart rate.[1, 2] The duration of the recovery period is longer after a longer preceding cycle, ie, after slowing of the rate. One therefore sees aberration particularly in beats which terminate a short cycle preceded by a longer cycle, such as in the first premature beat which signifies the onset of a paroxysmal supraventricular tachycardia.

Aberrant ventricular conduction is often confused with premature ventricular beats, particularly during auricular fibrillation. A visible P wave preceding the anomalous ventricular beat makes it easy to recognize aberrant conduction. In auricular fibrillation, however, where eliciting atrial impulses cannot be recognized, difficulty may arise in distinguishing between aberrant conduction and ectopic ventricular beats. Very often runs of such aberrant beats may be confused with ventricular tachycardia.[3] There is no doubt, that the recognition of aberrant ventricular conduction during auricular fibrillation is often of great importance and will lead to the correct treatment with Digitalis, which in the presence of frequent ventricular ectopic beats or ventricular tachycardia would be contraindicated.

It is the purpose of this presentation to enumerate and discuss some of the criteria which have been advanced for the differentiation of ectopic ventricular beats and aberrant beats during auricular fibrillation.[4, 5] In favor of aberration are: (1) Right Bundle Branch Block pattern, (2) variable couplings, (3) long-short cycle sequence (aberration usually terminates a short cycle preceded by a long one [3, 4]) and (4) lack of a long pause following the anomalous beat (a long pause favors ventricular ectopic beat). These proposed criteria are often helpful in the correct interpretation during auricular fibrillation; they are in no way foolproof, however:

(1) It is true that 80%-85% of aberrant beats

show an RBBB pattern[3] but, although this observation is certainly in favor of aberration, it has been shown that 63% of ventricular extrasystoles mimic RBBB,[6] which in turn diminishes the value of this pattern in the differentiation of the beats in question.

(2) The coupling interval is of value only if there are many anomalous beats for comparison present. Although fixed coupling may point more to ectopy, ventricular extrasystoles often show some variation in the coupling interval.

(3) Although long preceding cycles may set the stage for aberration, ventricular extrasystoles in form of bigeminy may also be precipitated by a lengthened ventricular cycle, a phenomenon which has been described as "rule of bigeminy,"[7] and which might limit the value of the long-short cycle sequence as a sign of aberration.

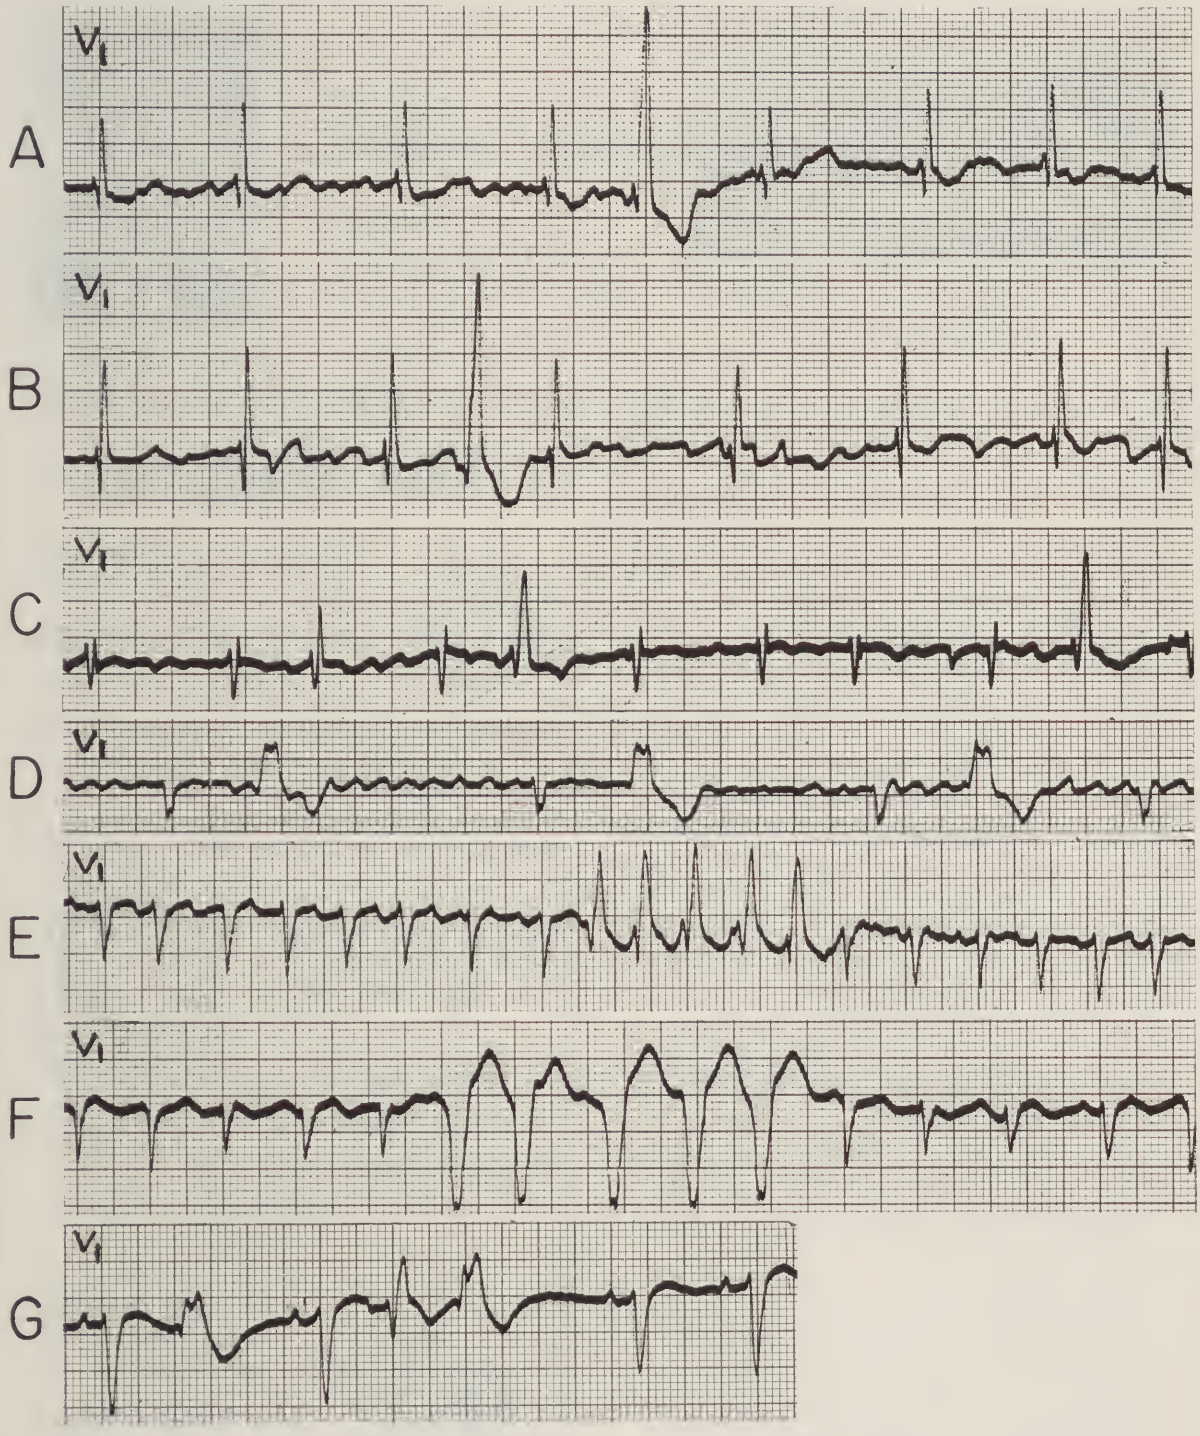
(4) A long pause, like a compensatory pause during sinus rhythm, often follows an ectopic beat. A ventricular beat can be interpolated without being followed by any pause, however, whereas aberrant beats are occasionally followed by a long pause.

Marriott and Sandler have recently shown[8] that, despite the available criteria and even with the help of additional criteria which they reported, no definite distinction can occasionally be made between ectopy and aberration. In looking for additional criteria, they found that 70% of aberrant beats showing an RBBB pattern in Lead VI have a triphasic (rsR′, rSR′ or rsr′) pattern compared with only 6% of ventricular extrasystoles that mimic RBBB. Conversely, 92% of ectopic beats mimicking RBBB showed a mono- or diphasic pattern (R, qR, PS or qr) in VI. In studying the initial vector of the QRS complex they also found that it is unusual (only in 4%) for the initial vector of a ventricular extrasystole to be identical with that of the flanking conducted beat, but found it common to show an identical initial vector in aberrant beats. They therefore came to the conclusion that a triphasic QRS pattern and an identical initial vector provide rather strong evidence in favor of aberration. A different initial vector, however, does not exclude it. These authors also mention a few other signs which might be helpful in differentiating between aberration and ectopy during auricular fibrillation, for example, the presence of similar bizarre beats in previous or following non-fibrillating tracing, undue prematurity, and the absence of a long preceding cycle, all of which favor ectopy.

In the Figure, tracings are illustrated in which the above mentioned criteria, particularly the recently described combined triphasic initial vector criterion, seem to be very helpful in the important differentiation between aberrant beats and ectopic beats during auricular fibrillation. All of the tracings were taken in Lead V1.

A) *A single aberrant beat during auricular fibrillation.* It shows an initial vector identical with that of the flanking conducted beats and a triphasic (rsR') contour. The aberrant beat is premature and terminates a short cycle preceded by a long one.

B) *A similar beat from the same patient that may or may not be aberrant.* It has a different initial vector and a diphasic (qR) contour. The premature abnormal beat is not followed by a pause.



C) *Varying degrees of aberration in the 3rd, 5th and 10th beat; triphasic contour and identical initial vector.* The aberrant beats terminate a short cycle preceded by a long one.

D) *Ventricular bigeminy during auricular fibrillation.* The coupling interval is fixed. Note the RBBB pattern but with a qR pattern and different initial vector.

E) *Auricular fibrillation with rapid ventricular response.* In the middle of the tracing there is a run of undoubted aberration simulating ventricular tachycardia. Note here the triphasic (rsR') pattern and identical initial vector.

F) *Run of anomalous beats during auricular fibrillation representing an ectopic ventricular mechanism.* Note the LBBB pattern and the cycle-sequence that militates against aberration—why should the third beat of the run be aberrant since it ends a much longer cycle than many of the conducted beats that are not aberrant?

G) *The combined triphasic-initial vector criterion, well illustrated during a sinus rhythm.* An auricular premature beat and a ventricular beat are side by side: both show RBBB pattern; the auricular beat (4th beat) shows a triphasic con-

WILLIAM E. JOHNSON

tour and same initial vector as the sinus beat, whereas the two ventricular premature beats show a diphasic (qR) contour and different initial vector.

In many tracings the differentiation between ectopy and aberration might be of purely academic interest (A and B in the Figure). In such tracings as those illustrated in E and F, however, the exact differentiation is certainly of great importance from the point of prognosis and treatment. A rapid run of aberrant beats, as seen in E, which is not too uncommon, imitates ventricular tachycardia; not recognizing this condition might deprive the patient from receiving Digitalis which might be lifesaving. On the other hand, not recognizing the ectopic ventricular mechanism in F, particularly in the presence of Digitalis treatment, might lead to ventricular fibrillation.

Improving Communication Between Special Education and Medicine

PETER J. VALLETUTTI, Ed D
Professor, Special Education
Coppin State College, Baltimore

For too long a time the medical profession has set itself apart from the general public and from education. Operating from behind barriers of a highly specialized and often incomprehensible idioglossia, the doctors have fostered an aura of mystery, of privileged information. So, too, have the special educators cut themselves off from the mainstream behind a smokescreen of special jargon. Both professions play the alphabet game which may facilitate intra-professional communication but confuses inter-professional discourse. The doctor speaks of CVAs, EEGs, children with PKU, while the special educator talks about his BI, MR, and ED children.

Because there is a need for interdisciplinary communication among the professional fields involved in the education of the exceptional child, it is essential that there be effective means of communication. Professional workers must become increasingly aware of the skills involved in communicating ideas. There is a need to clarify the basic concepts, the underlying principles, and the objectives of education and of medicine. Hand in hand with this is the obvious need to clarify and standardize terminology and definitions. For example, in a retarded population, there is a wide variation of etiologies, intellectual levels, and behavior patterns. Despite the fact that mental retardation is itself a practically meaningless categorization, many doctors make educational diagnoses and prognoses on the basis of their medical findings. Too often the special educator must deal with bitter and frustrated parents of mildly and of moderately retarded youngsters, who had been told by a physician that their child would "grow out of it." There is an urgent need for the special educator to: (1) standardize terminology within his own field, (2) facilitate the understanding of this terminology among other groups, and (3) become conversant with the terminology and practices of the medical field and its ancillary disciplines.

While the standardization of terminology is not of such vital concern in the more exact science of medicine as it is in the behavorial sciences, the medical profession needs to (1) comprehend and become conversant with the terminology and practices of education, and (2) facilitate the understanding of its terminology among the other professions.

Special education has become increasingly aware of the problems of communication and has taken various steps to remedy the deficiencies. In the field of mental retardation, the American Association on Mental Deficiency has attempted to standardize nomenclature. Teacher preparation programs reflect an increasing awareness that the special teacher requires an understanding of the language of the medical profession. Guest lecturers from medicine, team teaching (doctors and special educators), courses in other academic departments, clinical and hospital experiences, and specialized courses such as "Medical Information

for the Teacher" (to be offered soon at Coppin State College) are helping the special educator communicate more effectively with the doctor. There have been few other organized efforts in the special education field, however, to facilitate the understanding of terminology and special education practices among other groups. Perhaps teacher education institutions and professional associations can assist in this process by establishing institutes and workshops in which both professions actively participate.

Moreover, there has been little organized effort by the medical profession to facilitate the understanding of its language among the other professions. Perhaps the self-image of the doctor militates against this kind of fluency. If a group sees itself as an entity apart from the general community, it will not wish to communicate and will operate from behind walls erected by secret society and fraternal in-group mentalities. It appears that the medical profession may be losing sight of the fact that the special teacher will be better able to converse with the doctor if the teacher knows, for example, that bladder and sphincter control often are absent in spina bifida and, at the same time, do a better teaching job if he is aware of the resulting psychological problems and their effects upon the teaching-learning process. The teacher, on many occasions, requires medical information in establishing an educational diagnosis and prognosis. Certainly, the presence of nystagmus will adversely affect reading and the teacher needs to know this. And, reciprocally, a teacher's description of the behavioral and learning disabilities of the minimally brain-damaged child will aid the doctor in his diagnosis of brain damage.

The need to become more familiar with the terminology and practices of special education has not been met. Special educators should be brought into medical schools as guest lecturers and special education courses should be instituted in medical schools. (This is being done at the University of Colorado Medical School.) As the special educator is being required to obtain hospital and clinical experience, perhaps, the doctor should be encouraged to devote some time to classroom observation.

This article is perhaps inappropriately titled. The task at hand may not be learning to improve communication, but rather learning how to communicate. In order to do this, the two professions must find opportunities to sit down together at professional conferences and institutes, in classrooms and workshops. They must share knowledge in team teaching endeavors, in special courses, in guest lectures, in interdisciplinary staff conferences, and in informal meetings. They must examine concepts of self-image. The teacher must stop thinking of himself as low man on the totem pole, and the doctor must stop thinking of himself as the Brahmin of the interdisciplinary team, for only when each profession views itself as an equally vital member of the team can fluent, effective, and meaningful communication occur.

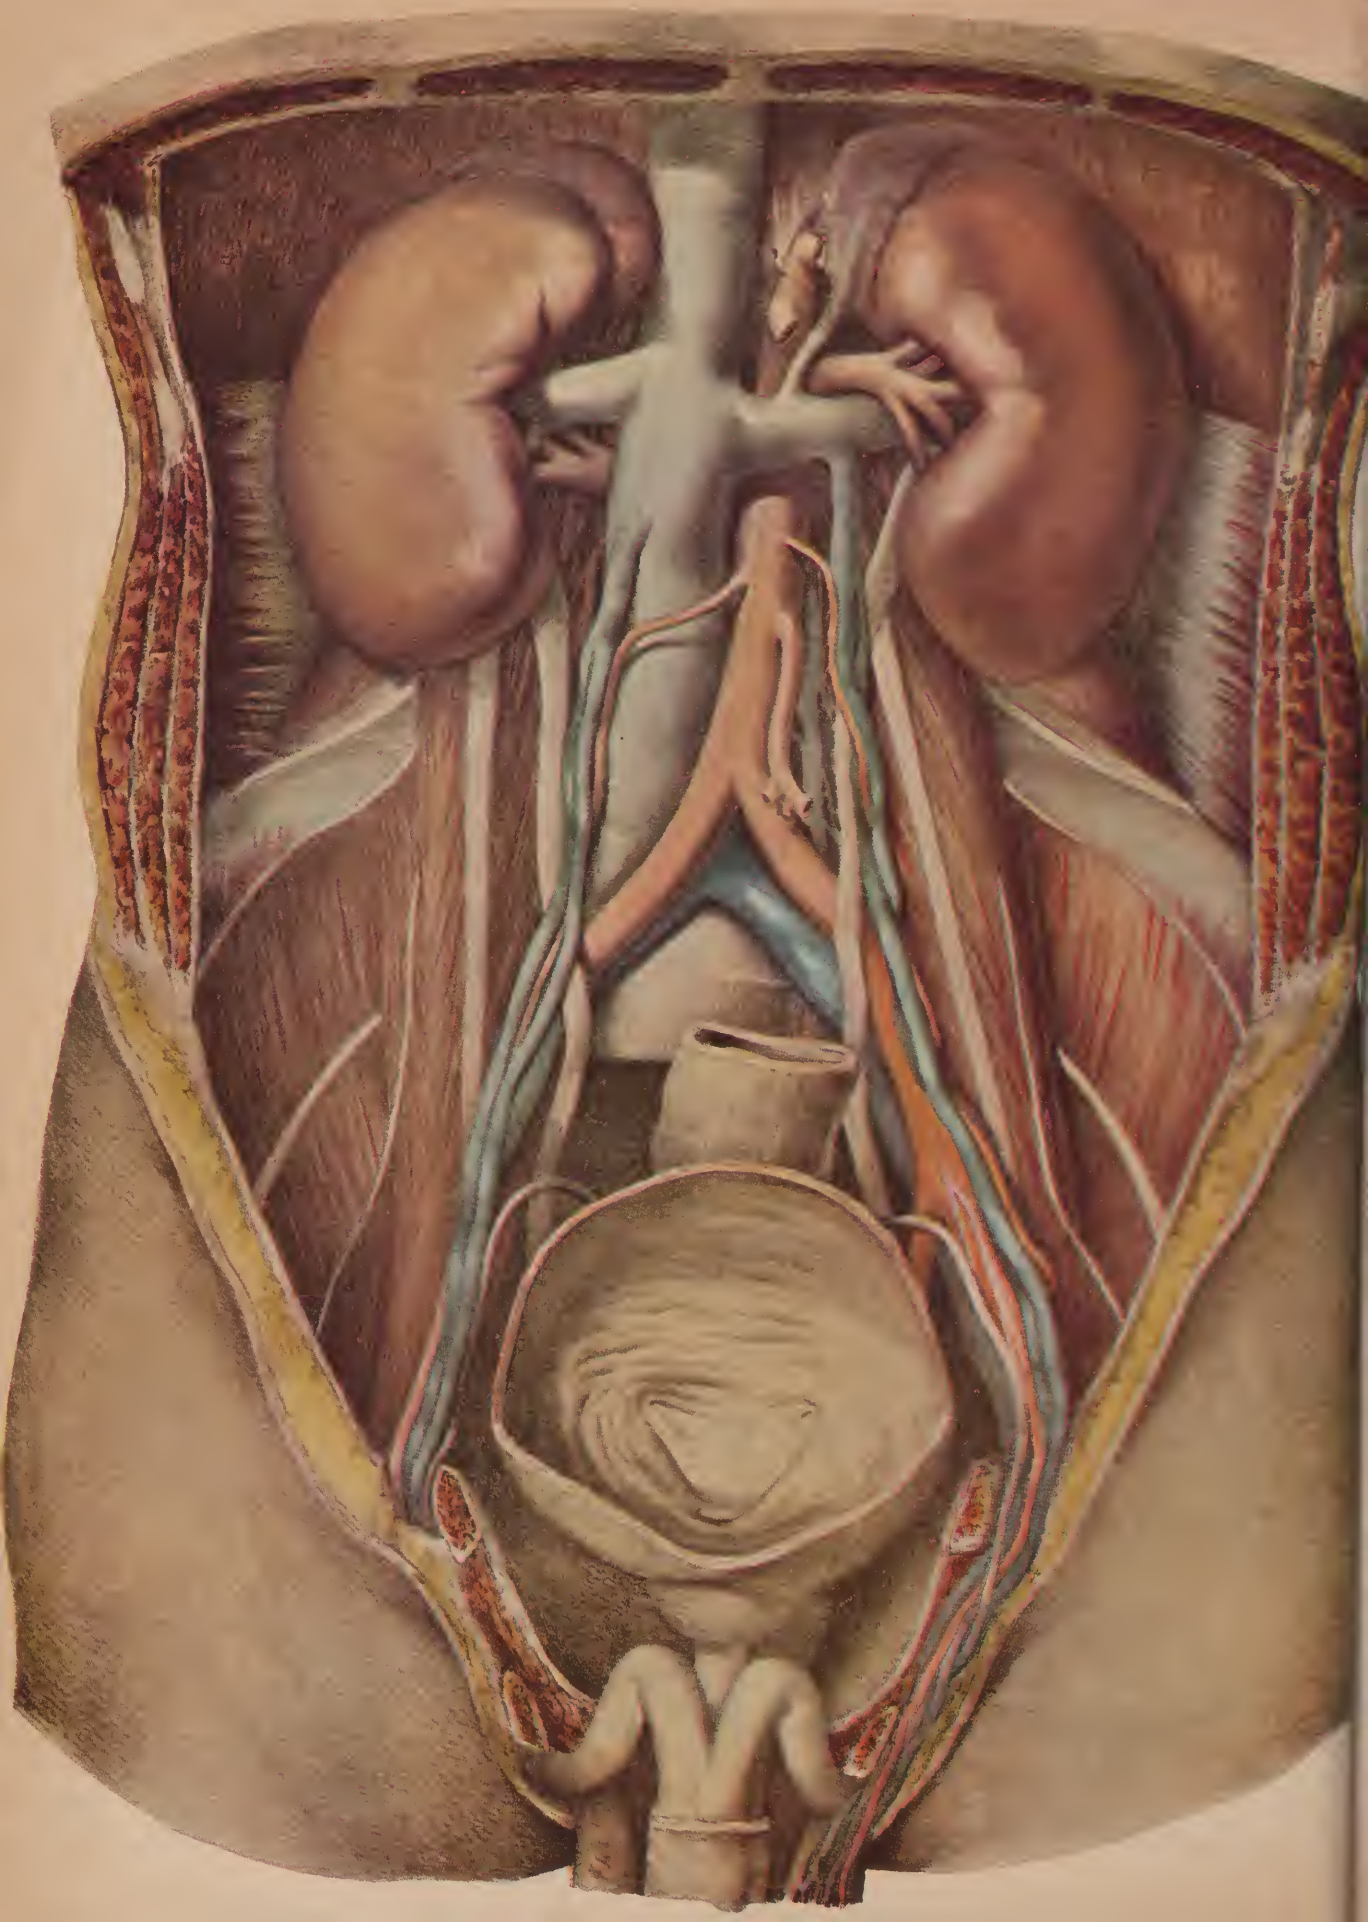
And now . . . for all you cold sufferers who've been looking for a cure-all.

ey can't cure a cold. We can't cure a cold. You can't cure old. But what you can do is relieve the symptoms, making e patient comfortable and the cold bearable.

e patient suffering from head cold congestion, for instance, ould breathe easier when you prescribe Novahistine LP.

vahistine LP is a long-acting decongestant that helps store normal mucus secretion and ciliary activity—physio-gic mechanisms which prevent infection of the respiratory ct. Two tablets in the morning and two in the evening will ovide around-the-clock relief by helping to keep congested passages clear, thus enabling your cold patient to enjoy rmal and free breathing.



Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Tell patients who operate machinery or motor vehicles that drowsiness may result.

Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

PITMAN-MOORE Division of The Dow Chemical Company, Indianapolis DOW

NOVAHISTINE® LP

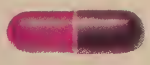
For relief of nasal congestion.

Wide-range bactericidal action for genitourinary infections

NEW OMNIPEN®
(AMPICILLIN) WYETH

A penicillin that exhibits effectiveness within the gram-positive spectrum of penicillin G* and the gram-negative spectrum of chloramphenicol and the tetracyclines.*

Active at foci of infections—kidney, ureter, bladder or urethra.



Effective against many gram-negative and gram-positive pathogens—thus may be valuable not only in genitourinary but also in common respiratory and gastrointestinal infections.

Normally produces high and persistent levels in blood and high concentrations in bile and urine.

Significant inherent stability.

**Exclusive of penicillinase-producing bacteria.*

Indications: Urinary tract infections, especially those caused by *E. coli*, *Proteus mirabilis*, and *Streptococcus faecalis* and *viridans;* respiratory infections caused by *H. influenzae*, pneumococci, streptococci, and nonpenicillinase-producing staphylococci; and gastrointestinal infections caused by *Shigella* and *Salmonella*, including *Sal. typhosa*.

Contraindications: Hypersensitivity to penicillin; infections due to penicillinase-producing staphylococci and other penicillinase-producing bacteria.

Precautions: If allergic reaction occurs, discontinue ampicillin and administer epinephrine, corticosteroids, antihistamines and/or pressor amines as indicated. Transient moderate elevation of SGOT values of undetermined significance was noted in a few infants. Liver and kidney function as well as hematopoietic tests are advisable during therapy, particularly in infants. As with other antibiotics, precautions should be taken against gastrointestinal superinfection. Safety for use in pregnancy has not been established.

Adverse Reactions: Occasional mild side effects as urticaria, skin rash, pruritus, diarrhea, nausea and vomiting. There have been no reports of blood dyscrasias, liver or kidney damage. Anaphylaxis has been reported.

Composition: Capsules, 250 mg.

American Hospital Formulary Service Category No. 8:12.16.

Wyeth Laboratories Philadelphia, Pa.

Wyeth® SERVICE TO MEDICINE

For he's a jolly good fellow

But what does he think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) SUSTAINED RELEASE CAPSULES
WITH MEPROBAMATE (300 mg.)

to help establish a new dietary pattern

Contraindications: Dextro-amphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

REHABILITATION Notes

REHABILITATION SECTION
BALTIMORE CITY MEDICAL SOCIETY,

DOUGLAS G. CARROLL M.D.
EDITOR

Exercise and Coronary Artery Disease

For years physicians have been fascinated with the relationship of exercise to coronary artery disease (CAD) and acute myocardial infarction (AMI). The question arises in three settings: first, whether the habitual level of exercise required in the patient's occupation is related to the severity or mortality of CAD; second, whether acute and severe exertion brings on AMI; and third, how much exercise should be allowed following recovery from AMI, how soon the patient should be allowed up, and how fast he should be mobilized.

1. Association Between Habitual Activity Level and Coronary Artery Disease

A number of studies have been performed in various industries comparing sedentary workers, such as clerks, telegraphers, telephonists, supervisory personnel and bus drivers, with more physically active workers, such as postmen, conductors on buses and switchmen in the railroad industry. Most studies have demonstrated that the incidence of CAD is higher among sedentary workers. For example, Taylor[1] comparing death rates among clerks, switchmen and section men in the railroad industry, showed that there was a consistently increasing death rate per 1,000 at different age groups—with the lowest rate among section men, a slightly higher rate among switchmen and the highest among clerks.

Morris et al[2] reported a higher incidence of CAD in drivers in the London Transport Executive than in the conductors, who are more active. They also compared postmen with a group of civil service executives, officers and clerks. Their conclusion was, "Men in physically active jobs have a lower incidence of coronary heart-disease in middle age than have men in physically inactive jobs. More important, the disease is not so severe in physically active workers, tending to present first in them as angina pectoris and other relatively benign forms, and to have a smaller early case-fatality and lower early mortality-rate."

The study of Spain and Bradess[4] of 1,000 consecutive deaths due to CAD corroborated the finding that sedentary occupational groups tend to have an earlier onset of death from CAD. Indeed, most studies seem to agree that sedentary activity is associated with a higher incidence of CAD and death at a younger age. This finding does not conclusively demonstrate, however, that lack of activity is a direct cause of the higher incidence of CAD.

There are a number of difficulties with these studies. In the first place, there may be factors other than exertion which differentiate the

groups. The person who would choose or be compelled to do heavy work undoubtedly has a different psychological makeup and social background than the person doing sedentary work. The food and smoking habits, and exposure to airborne dusts, are different in the two groups. Sedentary workers in certain industries, such as the railroad industry, tend to be accumulated in large cities, whereas the switchmen and section workers tend to live in smaller towns. There is some evidence that the rural areas have lower death rates than urban areas. Morris, Heady and Raffle[3] have presented evidence that bus drivers tend to be more obese than conductors, although this may be a reflection of the type of work. It is possible, however, that the obese tend to select sedentary jobs.

Even if it were proved that inactivity were related to CAD, it would not be possible to conclude from any evidence now at hand that the sedentary worker can decrease the risk of CAD or delay clinical onset by increasing his activity. It may well be that frenetic weekend physical fitness programs may be more harmful than helpful.

2. Exercise As An Immediate, Precipitating Cause of Acute Coronary Artery Thrombosis

There is a general impression that AMI occurs commonly in older men who attempt to clear their sidewalks of snow. The infarction is blamed on the excessive exertion, but usually this activity is performed by an elderly man after a heavy breakfast, in the extreme cold, so that identification of exercise as the precipitating cause is unwarranted. Over the last 30 years, a number of studies have shown that AMI occurs more often during rest than during or following exercise. A study of Phipps[5] in 1936 showed that only 40% of the patients had been performing some physical activity prior to the onset of the attack. Master et al,[6] in a study of 817 attacks of AMI in 555 patients, showed that about 40% of the attacks occurred while the patient was at rest or asleep; 18% occurred while the patient was walking, 14% during mild activity, 5% during moderate activity and only 2% during severe activity. In Spain and Bradess's[4] study of 410 cases, only 67 had a definite history of physical activity that could be classified as moderate to strenuous in the period immediately preceding the attack.

A problem arises in study of factors preceding acute AMI as to how an ordinary day is divided among sleep, sitting, walking, and heavier activities. Heavy exertion could well be a precipitating factor in acute AMI, but because most people never perform heavy exertion, this precipitating factor could appear to be rare because exertion is rare.

It is significant that a number of exercise studies have been performed on patients with known angina pectoris[7] without particular danger of AMI. In addition, innumerable Master's tests are performed on patients with suspected coronary artery disease with a very low mortality rate.

3. Exercise After Recovery from Myocardial Infarction

For some time it has been a general clinical impression that moderate exercise following recovery from a myocardial infarction is helpful, rather than harmful, provided cardiac failure and angina are not present.

This belief is now being put to the test by several investigations. Hellerstein et al[8] have reported 53 men with CAD, 39 of whom had myocardial infarctions and 14 angina pectoris (but not cardiac failure). They were subjected to a supervised graded, individualized exercise program two to three times weekly. Thirty-eight patients fully adhered to the program, nine adhered only partially and six did not adhere at all. The average follow-up was 19 months per individual. There were two deaths. There was objective improvement (exercise ischemic S-T displacement, heart rate, blood pressure, systolic tension-time index) in about 82% of those who fully adhered to the exercise program, 55% of those who partially adhered and 17% of those who did not adhere to the full exercise program.

The reasons why certain patients did not complete the program are not given, but one might ask whether they were in poorer physical condition to start with than those who did finish the program.

It seems proper to conclude from the clinical experience and studies performed that moderate or even heavy exercise is not harmful either in predisposing to CAD, in precipitating AMI or following recovery from AMI, provided the patient is not in heart failure and does not have angina pectoris. Indeed, the evidence is strong

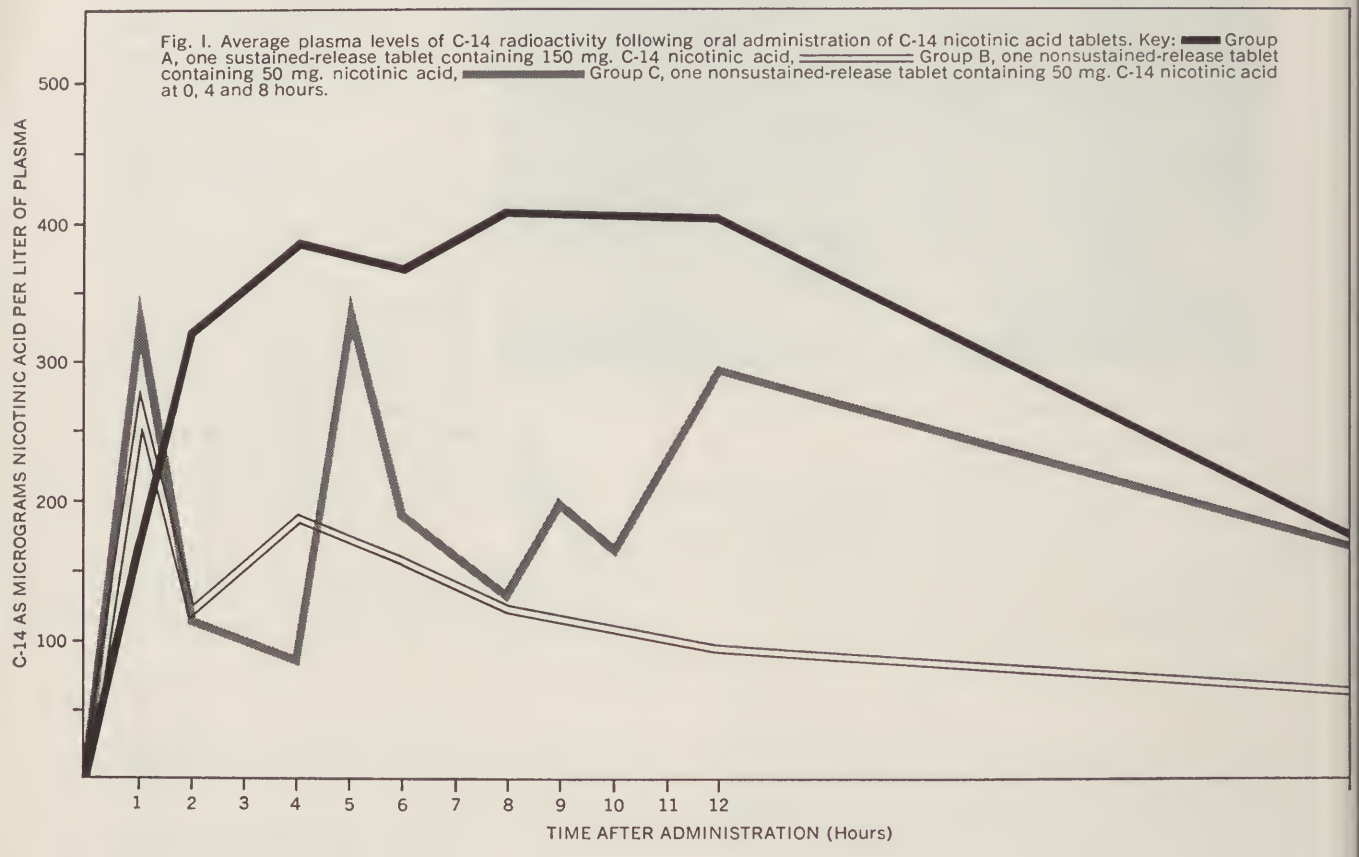
Only JOBST supports are custom made from precise measurements of the individual extremity.

JOBST Service Centers:
818 Eighteenth St., N.W.
Washington, D.C. 20006 — Ph. 298-5530
Suite 415 Medical Arts Building
101 W. Read St., Baltimore, Md. — Ph. 539-0560

When the patient's extremity is carefully measured with the unique JOBST Measuring Tape, it marks the second step toward providing him with a custom-made VENOUS PRESSURE GRADIENT support. The first step begins with a prescription. Your prescription. With your diagnosis and indication for the correct counter pressures to be engineered into the support. JOBST supports are widely used in treatment of stasis dermatitis, postmastectomy lymphedema, postural hypotension, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at one of our convenient Service Centers.

© JOBST, 1966

that moderate daily exercise is helpful in all chronic stages of coronary artery disease.



* * * * *

There are other reasons besides possible effects on coronary circulation to urge gradual moderate exercise after an AMI. It is well established clinically that inactivity in the chronically ill is often accompanied by depression, passivity and withdrawal from normal life. Harrison[9] notes, "The experienced physician knows that of the various symptoms associated with disorders of the heart, fear causes more hours of human suffering than all of the others combined." The attitude of the physician toward exercise may do more to allay the patient's anxiety following an AMI than any amount of explanation and reassurance. During the early recovery from AMI, it is important, where possible, to start the patient on graded increase in activities so that he can see that he is improving. The speed of mobilization is not of primary importance. That is, a patient with a very severe AMI can be advanced in activity very slowly. If he sees some improvement weekly, it may be all that is necessary. To the less severely ill patient, daily increase in activity may be appropriate.

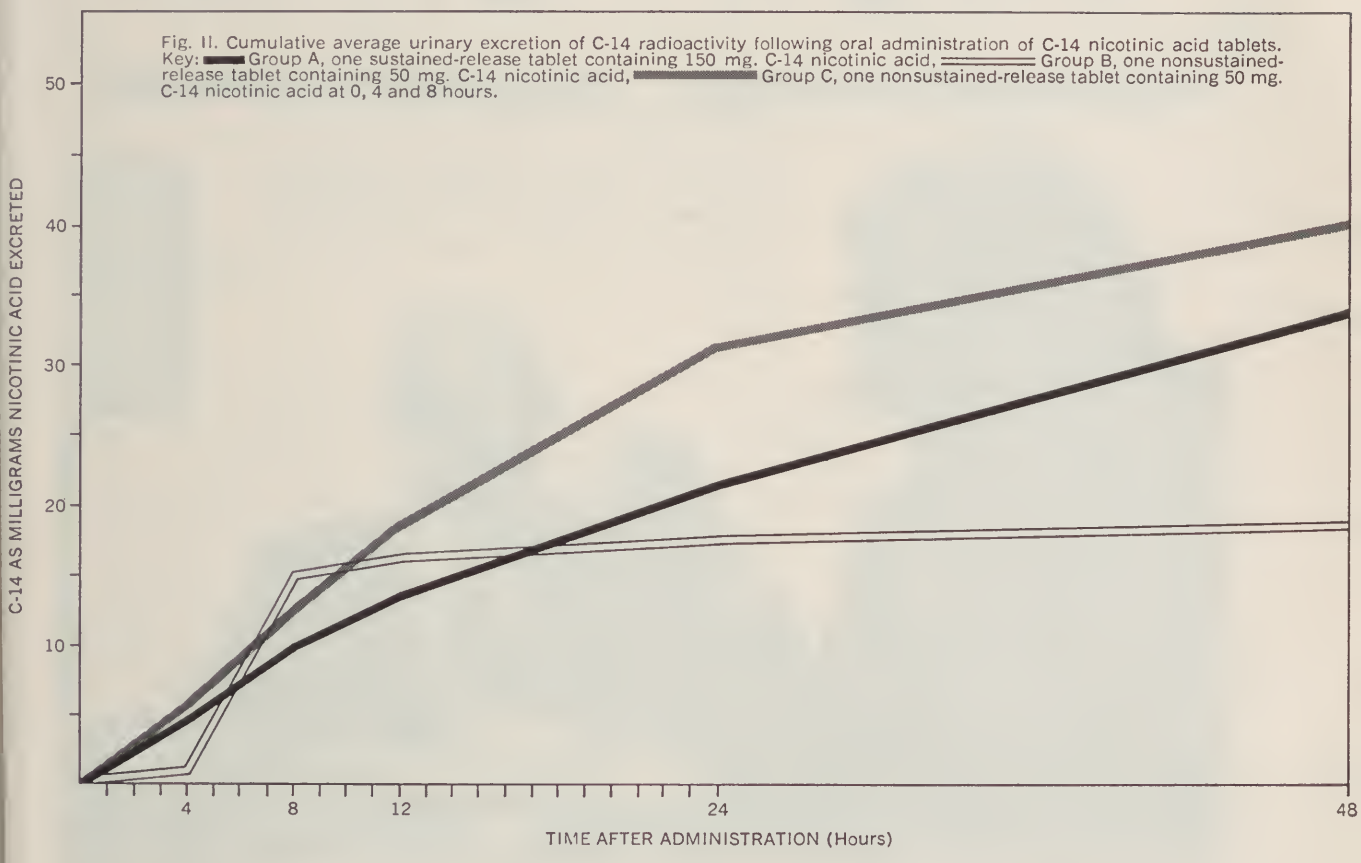
Sustained circulatory, respirator and cerebral stimulation for th

(fewer absent doses by absent-minded patients)



Human volunteer subjects were administered Geroniazol TT tablets with the nicotinic acid component made radioactive with C-14. Plasma and urine samples were analyzed. (See Figures I and II) The radioactive tracer study substantiated the previous clinical evidence that the release of nicotinic acid from the Geroniazol TT tablet produced a gradual rise in plasma levels to a plateau for a total of 12 hours and more.

Such proven sustained activity makes the management of geriatric patients much easier by minimizing the possibility of neglected doses through absent-mindedness or senile confusion. Therapy *can* be continuous on a daily dose of only one Geroniazol TT tablet every 12 hours.

The gradual release of nicotinic acid in Geroniazol TT will provide the well-known peripheral vasodilatation needed in patients with deficient circulation and with a minimum amount (if any) of "flushing." Also, cerebrovascular circulation is complemented by pentylenetetrazol, long-established as a cerebral and respiratory stimulant.

Geroniazol TT improves the typical, unfortunate, signs of senile confusion. Patients become more alert,

ged and debilitated

less confused and moody. Personal care, memory, emotional stability, social attention improve. Fatigue, apathy and irritability are reduced.

A prescription for 100 tablets of Geroniazol TT will permit your patients to enjoy the benefits of time-prolonged nicotinic acid/pentylenetetrazol therapy, at an economical price. Dosage is only one tablet every 12 hours.

Contraindications: There are no known contraindications.

Precautions: Exercise caution when treating patients with a low convulsive threshold.

Side Effects: Side effects are rarely encountered, however due to the vasodilatation effect of nicotinic acid, transitory mild nausea, flushing, tingling and pruritus are possible.

Dosage: One tablet every 12 hours.

Supplied: Prescribe bottles of 100 tablets, to take advantage of recent price reduction.

"I like Bronkometer... I breathe better... don't get the jitters."

Patients feel relaxed with Bronkometer. Its bronchodilator-decongestant action has minimal central nervous system stimulation.[1] Isoetharine,* Breon's exclusive bronchodilator, shows only 1/16 to 1/64 the cardiotonic effect of isoproterenol.[2] *Dilabron®, brand of isoetharine

BRONKOMETER® ASTHMA, CHRONIC BRONCHITIS, EMPHYSEMA

isoetharine 0.6%; phenylephrine 0.125%; thenyldiamine 0.05%—Superior because it contains isoetharine

COMPOSITION: Bronkometer delivers at the mouthpiece 200 metered doses of: 350 mcg isoetharine methanesulfonate (0.6%); 70 mcg phenylephrine HCl (0.125%); and 30 mcg thenyldiamine HCl (0.05%) with saccharin, menthol and fluorochlorohydrocarbons as inert propellants. Preserved with ascorbic acid 0.1% and alcohol 30%.

RECOMMENDED DOSAGE: One or two inhalations with at least one minute between inhalations. Occasionally more may be required, however in most cases, inhalations need not be repeated more than every four hours. Dosage should be adjusted to the severity of the condition and to patient's response.

PRECAUTIONS: Bronkometer is unusually free from cardiovascular and other side effects, but the usual precautions associated with sympathomimetic amines should be observed. Bronkometer should not be administered simultaneously with epinephrine or similar compounds because of the possibility of tachycardia, although it may be alternated with these agents. Dosage must be carefully adjusted in patients with hyperthyroidism, hypertension, acute coronary disease, cardiac asthma, limited cardiac reserve and in individuals sensitive to sympathomimetic amines.

SUPPLIED: 10 ml pressurized aerosol vials complete with measured dose valve and oral nebulizer.

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, *Commissioner*

HIGHLIGHTS

TYPHOID VACCINE

The State Health Department is now stocking only the monovalent typhoid vaccine. The use of the triple vaccine (typhoid with para A and para B) was discontinued following a report of the Advisory Committee on Immunization Practice of the Public Health Service that the effectiveness of paratyphoid A and B vaccines is not established and their use is not recommended.

Typhoid vaccine is recommended for those having intimate contact with carriers, for those involved in localized outbreaks, and for those travelling in foreign countries where typhoid fever is endemic.

Typhoid vaccine is no longer used on a mass scale except in rare community or institutional outbreaks. Thirty years ago, 300 to 500 cases were reported in Maryland each year, but since 1942 there has been a steady decline in the number of cases reported. During the last five years the figure has varied from 3 to 14 cases annually.

For adults and children over 10 years of age, the recommended dose of the monovalent typhoid vaccine is two 0.5 cc subcutaneous injections given at intervals of four or more weeks.

The dose for children 6 months to 10 years of age is 0.25 cc in each of two doses. Booster injections of 0.5 cc for adults and 0.25 cc for children, given subcutaneously, or 0.1 cc given intradermally, should be administered every three years.

DEER'S HEAD ACCREDITED

The Board of Commissioners of the Joint Commission on Accreditation of Hospitals has approved the recommendation that Deer's Head State Hospital be accredited for the period of one year.

SCHOOL HEALTH

Added emphasis has been given to the school health program by the State Departments of Health and Education through the recent addition of school health educators to their staffs.

A Committee to Revise School Health Laws, composed of representatives from both State and local departments of health and education, and from the State Department of Mental Hygiene, has been organized to recommend changes in the existing laws to provide the nucleus of a sound school health program.

A newsletter, to be published jointly by the Departments of Health and Education, will be distributed three times a year, beginning in October. It will encourage discussion of current health issues involving the health of school-age children. The first issue will be devoted to Family Life Education.

SMOKING CLINIC

1965 Birth Certificates Show Encouraging Trend In Prenatal Care

A study of birth certificates for 1965 by the City Health Department's Bureau of Biostatistics indicates encouraging results from the Department's efforts to reduce longstanding high infant death rates in the city, especially among the nonwhite segment of the population. The following notable gains were reported:

1. In 1965 there was increased utilization of existing health facilities for prenatal care. More women sought care and sought it at an earlier stage of pregnancy than in 1964.

2. On a city-wide basis the number of pregnant nonwhite girls 16 years and under was 888 in 1965, as compared with 834 in 1964. The proportion of these pregnant girls who sought prenatal care in the first third of pregnancy almost doubled (from 8.4% to 16.2%). Definite improvement was shown by all age groups of nonwhite women.

3. While the death rate for white infants in the first month of life remained at about the same level in 1964 and 1965, the death rate for nonwhite infants dropped by 13.5% over 1964. The greatest decline in infant deaths occurred in nonwhite infants whose mothers had prenatal care within the first three months of pregnancy; this group experienced a drop in death rate of 44.6%. A lesser decline of 18.7% was noted in nonwhite infants whose mothers sought care in the second three months of pregnancy. This comparison demonstrates most dramatically the vital importance of pregnant women seeing a doctor early in pregnancy.

4. There were 19,907 resident live births in 1965, as compared with 21,987 in 1964. The birth rate and the resident live births continued to decline at a pace greater than that of the national rates. White live births dropped by 10.8% and the nonwhite by 8.2%.

The Baltimore Maternity Center, the headquarters facility of Project 501, cared for 6,243 pregnant patients in 1965, as compared with 6,211 in 1964, an increase despite the 9.5% decline in resident live births in the same period.

The Baltimore Maternity and Infant Services Center, 211 West Lombard Street, is under the direction of Dr. Kathleen A. Swallow. The Center is open daily, 8:30 AM to 2:00 PM, Monday through Friday. Physicians may refer their needy pregnant patients to the Maternity Center for prenatal and follow-up care.

Now
b.i.d. convenience
plus
even greater patient savings
over q.i.d. tetracycline therapy

(plus all the advantages of tetracycline phosphate complex)

new Tetrex® bidCAPS*

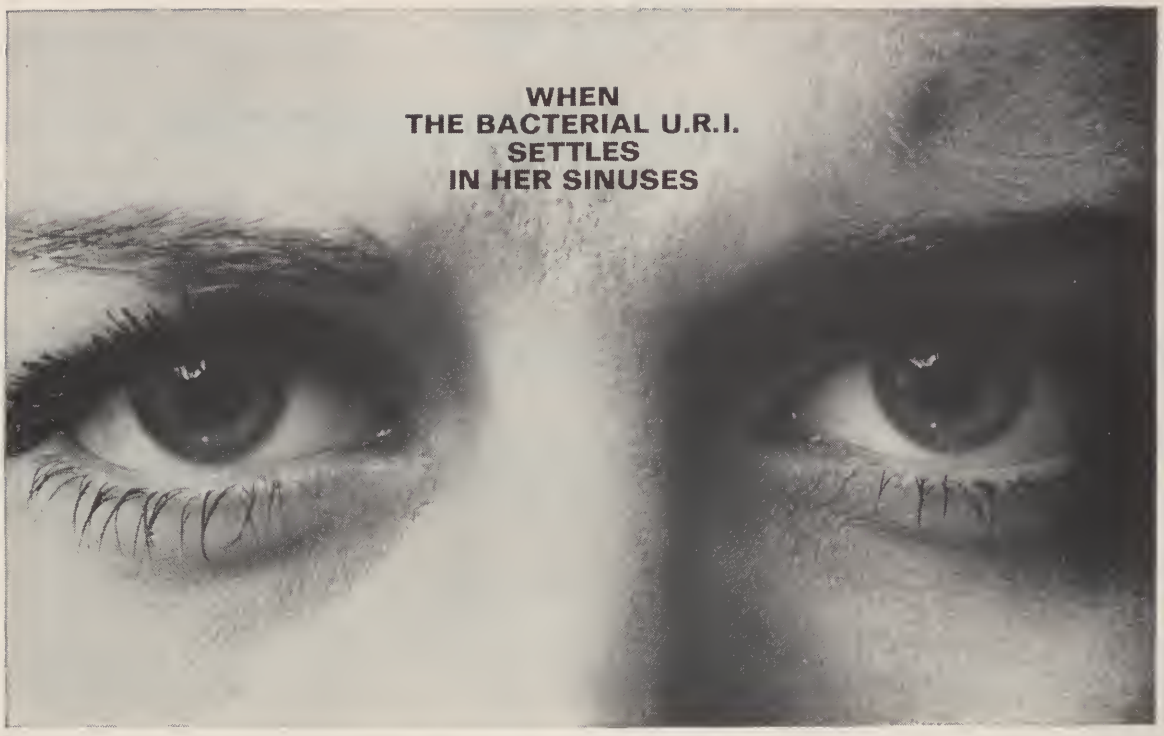
(tetracycline phosphate complex)

Maximum patient savings. New bidCAPS now enable you to prescribe tetracycline in an even more economical, more convenient form. Your patient's prescription dollar gets maximum value: a daily bidCAPS dose is priced lower than any other leading brand of tetracycline—b.i.d. or q.i.d.

Well tolerated. Tetrex (tetracycline phosphate complex) is well tolerated. Gastrointestinal side effects are few; photodynamic reactions are extremely rare.

More of the active antibiotic in the blood. The basic tetracycline in Tetrex (tetracycline phosphate complex) is less bound to serum protein than is demethylchlortetracycline.[1] Result: Tetrex (tetracycline phosphate complex) provides a higher percentage of active antibiotic in the blood.

Available in bottles of 16 and 50.



BRISTOL

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms. *Contraindications:* The drug is contraindicated in individuals hypersensitive to tetracycline. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Mycotic or bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, voginitis, dermatitis and allergic reactions may occur. *Usual Adult Dose:* 500 mg. b.i.d. Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or two hours after meals.

Reference: 1. Roberts, C. E., Jr.; Perry, D. M.; Kuharic, H. A., and Kirby, W. M. M.: A. M. A. Arch. Int. Med. 107:204 (Feb.) 1961.

*bidCAPS is a trademark of Bristol Laboratories, Division of Bristol-Myers Company, for its brands of twice-a-day capsules. Each Tetrex bidCAP contains Tetrex (tetracycline phosphate complex) equivalent to 500 mg. tetracycline HCl activity.

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:

ACHROMYCIN® Tetracycline HCl	125 mg
Phenacetin	120 mg
Caffeine	30 mg
Salicylamide	150 mg
Chlorothen Citrate	25 mg

The patient can feel better while getting better. ACHROCIDIN brings the treatment together in a single prescription—prompt symptomatic relief together with early, potent control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract.

Contraindication—History of hypersensitivity to tetracycline.

Warning—If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and if therapy is prolonged, tetracycline serum level determination may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment and treatment should be discontinued at first evidence of skin discomfort.

Precautions—Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect has been observed in usual short treatment courses.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.

STATE OF MARYLAND

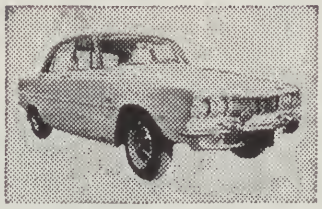
Department of Mental Hygiene

Isadore Tuerk, MD, Commissioner

Kurt Gorwitz, Statistics Director

THE SCHIZOPHRENIC PATIENT

Schizophrenia is the most frequently noted diagnosis in Maryland's psychiatric hospitals and clinics, with nearly one-fourth of all patients reported to have this disorder. In the state-operated hospitals, 46.2% of all beds are occupied by schizophrenics and they comprise 57.8% of all patients who have been hospitalized for five years or more.



The Table shows the latest available data on the one-day prevalence of schizophrenic patients in all inpatient and outpatient facilities reporting to the Maryland Psychiatric Case Register by age and by major diagnostic subgroup. Paranoid and chronic schizophrenics, the two largest groups, accounted for 60% of these cases. Rates increase to a maximum between 45 and 64 years of age, after which they decrease slightly.

During a recent three year period (July 1, 1961-June 30, 1964), more than 14,000 Maryland residents (or one out of every 225) were reported to have had one or more treatment episodes for schizophrenia. The proportion of the total population under care was slightly higher for females than for males and considerably higher for non-whites than for whites. However, the highest rate was noted for white males between the ages of 35 and 44 who were separated from their wives, with more than two percent of these Maryland residents under treatment for schizophrenia.

The types of schizophrenia were first classified and described by Emil Kraepelin more than 50 years ago. A number of studies since that time have reported considerable variation in its frequency of occurrence. Available Register data for

Maryland indicate an annual incidence rate of approximately 50 (per 100,000 estimated population), or nearly 1,800 new cases per year. This number indicates that it is one of our major disease entities, particularly since it is frequently a chronic condition which was first observed at an early age. While psychotherapy, drugs and available supportive services have enabled increasing numbers of schizophrenics to function as family and community members, the continuing need is for expanded research related to the causes, prevention and management of this illness.

Doctor,

Here is the Abbott anorectic program designed to meet the individual needs of your overweight patients.

mood elevation

Abbott
Anorectic
Program

DESOXYN® Gradumet® (methamphetamine hydrochloride)

Smooth appetite control plus mood elevation.

The obese patient on a diet often has to battle depression as well as overweight. Desoxyn Gradumet helps the dieter in both battles by elevating the mood while it curbs the appetite. Thanks to the Gradumet, medication is smoothly released all-day from a single oral dose.

If she can't take plain amphetamine, put her on DESBUTAL® Gradumet

Calms anxieties; controls compulsive eating.

Desbutal Gradumet provides 2 drugs in 2 tablet sections, combined back to back to form a single tablet. One section contains Desoxyn to curb the appetite and lift the mood; the other contains Nembutal® (pentobarbital) to calm the patient and counteract any excessive stimulation.

Both drugs are released in an effective dosage ratio throughout the day.

controlled release

Abbott
Anorectic
Program

Not all long-release vehicles are the same. Here is why the Gradumet is different and what it means for your overweight patients.

The release action is purely physical and relies on only one factor common to every patient: gastrointestinal fluid. There is no dependence on enteric coatings, enzymes, motility, or an "ideal" ion concentration in the gastrointestinal tract.

Your patients get a measured amount of medication, moment by moment, throughout the day.

They are not subjected to ups and downs of drug release . . . or to erratic release from patient to patient . . . or to erratic release in the same patient from day to day.

That's why the Gradumet provides controlled-release as well as long release.

Perhaps you saw the Gradumet model demonstration which shows that the release is entirely physical. When fluid is added, the drug in the outer ends of the channels dissolves. As fluid penetrates deeper into the channels, there is a continuous release of medication. The rate of release is rigidly controlled by the size and number of channels.

practicing pediatrics in Cumberland.

"Maganga," a documentary film on the status of medicine in Africa, was presented at the conclusion of Dr. Hashim's talk.

The session was highlighted by the semiannual banquet at the Ship's Cafe. Raymond Yow, MD, advisor to MAMA from Salisbury, was the master of ceremonies and his wit proved to be delightful. Dr. Yow is a diplomate of the American Board of Urology and Fellow of the American College of Surgeons.

Raymond Atkins, MD, advisor to MAMA from Baltimore, was unable to attend this meeting and his absence was keenly felt because of the many contributions in time and effort which he has made during past meetings.

Solutions to Business Problems in Daily Medical Practice

What to Do About Christmas Gifts

WILBURN L. McCLURE, JR.

Each year, about this time, the same familiar questions arise regarding Christmas giving. Here is a review of some typical questions accompanied by recommended solutions.

Q. "Should I give my office staff a personal gift or cash?"

A. "If you give an employee cash, it does not come within the $25 annual gift limitation rule. If you wish to deduct the amount given as a gift, however, it must be reported on the recipient's W-2 slip for income tax purposes. Gifts of tangible personal property, such as a watch, portable typewriter, tape recorder, or radio, costing no more than $100 and given for 'loyalty' or 'devotion to duties' are not included in figuring the $25 limitation.

"Whatever you decide, make your decision early. If it is to be a gift, try to learn what she really needs. If it is to be cash, give it at least two weeks before the holiday. It may be the answer to her gift budget, and she won't die of anticipation."

Q. "What should I do about gifts to interns, residents, and nurses who assist me?"

A. "Gifts for an intern or resident sometimes present a problem. Practically speaking, there could be no finer or more useful gift than a certificate to one of the better local restaurants. Even if he should receive more than one such gift, the odds are that each one will be thoroughly enjoyed and probably at a place he might not otherwise go because of his limited time and budget.

"For the nurse, again a gift certificate, but this time from one of the large department stores where she can purchase the toiletries or other items personally needed but not found under the Christmas tree."

Q. "What should I give to referring colleagues, patients, and friends that is a little different from the usual?"

A. "Gifts to referral sources should be useful and practical. Clocks, elaborate ash trays, brief cases, transistor radios, and electric knives, can openers, and tooth brushes are but a few of the long list of gifts almost anyone would like to receive."

Q. "What are the limitations on professional gifts under the present tax rules?"

A. "Deductions for gifts to referring colleagues, patients, and friends, as well as to interns, residents, and nurses are limited annually to $25 a person. The $25 limitation affects a partnership as well as a solo practi-

tioner in that the partnership cannot exceed $25 a person annually, regardless of the number of partners. You can, of course, give a more expensive gift to valued, helpful friends, but you may deduct no more than $25. These rules do not apply to employees."

Q. "I don't believe in giving gifts. What about entertaining instead?"

A. "Entertainment is important at this time of year. Entertaining small intimate groups, especially in your home, adds a personal warmth to the season. Sunday brunch or a late evening dinner are ideal occasions. (You may wish to review, "What You Should Know About Entertaining Colleagues," *Maryland State Medical Journal*, May, 1966, page 155.)

So that you may achieve the true art of giving and entertaining, keep the following thought in mind: "Have I included everyone on my list so that I will not offend a single person?"

NOVEMBER, 1966

Semiannual Meeting

The Semiannual Meeting of the Woman's Auxiliary to the Faculty, concurrent with the Semiannual Meeting of the House of Delegates, was held Friday morning, September 9, in the Diplomat Motor Hotel, Ocean City, Md. Mrs. Archie R. Cohen, president of the Auxiliary, presided at the meeting, which was opened with greetings from Manning W. Alden, MD, the Med-Chi Advisor.

At the conclusion of the business session, Carolyn S. Pincock, MD, addressed the members on the subject of "Aspects of Adolescent Medicine Through the Eyes of the Physician and his Wife." Dr. Pincock, who is an Associate Attending at the Children's Hospital in Washington, DC, talked primarily of a practical approach to such adolescent problems as health, personality, and family interrelationships.

October A Busy Month for Auxilary Leaders

The Woman's Auxiliary is constantly seeking ways to help physicians meet the health needs of people in their communities. In October, the Maryland Auxiliary leaders traveled to Chicago and to New York City to acquire knowledge of other programs for the advancement of medicine and public health.

Those who attended the 1966 Fall Conference of the Woman's Auxiliary to the American Medical Association, from October 2 to 4 at the Drake Hotel in Chicago, included Mrs. William S. Stone, Baltimore, a national director of the Woman's Auxiliary to the American Medical Association; Mrs. John E. Baybutt, Easton, Eastern regional chairman for AMA-ERF; Mrs. Archie R. Cohen, Clear Spring, president of the Woman's Auxiliary to the Medical and Chirurgical Faculty; and Mrs. Wallace H. Sadowsky, president-elect of the Woman's Auxiliary to the Faculty.

The Hon. Vu Van Thai, ambassador to the U.S. from South Vietnam, was the featured Conference speaker. He highlighted the impact of medical programs on his country's civilian population. Appearing with him were Norman Hoover, MD, Mayo Clinic, who described his experiences in Vietnam, and Ernest B. Howard, MD, AMA assistant executive vice-president, who described the association's Vietnam projects.

Other program features included presentations on Title XIX of the Medicare law by: Charles L. Hudson, MD, AMA president; Ellen Winston, PhD, a commissioner of the Health, Education, and Welfare Department; Mr. Howard Hassard, executive director of the California Medical Association; and Henry I. Fineberg, MD, executive vice-president of the Medical Society of the State of New York.

Another speaker was Dean W. Roberts, MD, executive director of the National Commission on

Community Health Services, Inc. His topic was "Health Is a Community Affair." Additional program topics were "Action Programs for Women" and such direct service auxiliary projects for the homebound and elderly as homemaker service, meals-on-wheels and Volunteer Friendly Visitor training.

On Tuesday night conference members attended a dinner sponsored by the American Medical Political Action Committee, where the featured speaker was Congressman Donald Rumsfeld, R, 13th Congressional District, Illinois. Also scheduled during the conference were regional membership dinners and discussion sessions on parliamentary procedure and press relations.

The National Eastern Regional Workshop at the City Squire Motor Inn, New York City, on October 10 and 11 was sponsored by the National Auxiliary, and conducted for the state auxiliary presidents, presidents-elect and chairmen of the following committees: AMA-ERF, Community Service, Health Careers, Legislation, Membership, and Mental Health. Those from Maryland who attended were Mrs. Cohen, Mrs. Sadowsky, Mrs. Baybutt, and Mrs. DeWitt E. DeLawter, Bethesda, the state chairman for Legislation in the Auxiliary.

Auxiliary Officers

The officers and committee chairmen of the Woman's Auxiliary to the Medical and Chirurgical Faculty for the year ending April, 1967, are listed below for the benefit of non-members who would like to join the Auxiliary and present members who are not currently participating in any of its activities. All are urged to select a field of interest and volunteer their services to the appropriate committee chairman, or to direct questions and suggestions to one of the officers.

President: Mrs. Archie R. Cohen, Clear Spring, 842-2838
President-elect: Mrs. Wallace H. Sadowsky, Havre de Grace, WE9-1918
1st Vice-president: Mrs. M. McKendree Boyer, Damascus, CL3-2122
2nd Vice-president: Mrs. Raymond M. Yow, Salisbury, PI2-1381
3rd Vice-president: Mrs. Raymond C. V. Robinson, Baltimore City, DR7-8777
4th Vice-president: Mrs. Carlton Brinsfield, Cumberland, 724-5820
Treasurer: Mrs. George S. Malouf, Hyattsville, 277-5885
Recording Secretary: Mrs. Robert A. Reiter, Baltimore City, LO6-2718
Corresponding Secretary: Mrs. Howard N. Weeks, Hagerstown, 739-2420
Parliamentarian: Mrs. Martin E. Strobel, Baltimore County, 833-3242

Committee Chairmen

AMA-ERF: Mrs. G. Overton Himmelwright, Cumberland, 724-0731
Community Service: Mrs. M. McKendree Boyer, Damascus, CL3-2122
Convention: Mrs. Delmas D. Caples, Baltimore County, 833-4699
Mrs. Martin E. Strobel, Baltimore County, 833-3242
Councilor to Woman's Auxiliary to the Southern Medical Association: Mrs. Raymond C. V. Robinson, Baltimore City, DR7-8777
Disaster Preparedness: Mrs. John R. Smith, Jr., Centreville, 758-0734
Doctor's Day: Mrs. Raymond C. V. Robinson, Baltimore City, DR7-8777
Editor, Auxiliary Page, Maryland State Medical Journal: Mrs. Harry L. Berman, Ellicott City, HO5-1422
Finance: Mrs. O. D. Sprecher, Jr., Hagerstown, 733-7118
Health Careers: Mrs. Raymond M. Yow, Salisbury, PI2-1381
Historian: Mrs. John Baybutt, Easton, 822-0811
Hospitality: Mrs. David S. Clayman, Hyattsville, WA7-2002
International Health Activities: Mrs. Leland Ransom, Cumberland, PA2-8018
Mrs. Carlton Brinsfield, Cumberland, 724-5820
Legislation: Mrs. DeWitt E. DeLawter, Bethesda, OL2-2506
Student Liaison to Woman's Auxiliary to Student AMA: Mrs. Albert E. Goldstein, Baltimore City, BE5-1341
M.D.'s WIFE: Mrs. Sullins G. Sullivan, Baltimore City, VA5-6422
Members-at-large: Mrs. Elmer G. Linhardt, Annapolis, 263-2156
Membership: Mrs. Wallace H. Sadowsky, Havre de Grace, WE9-1918
Mental Health: Mrs. Irving J. Taylor, Baltimore City, HU6-4066
Newsletter: Mrs. Samuel R. Wells, Mt. Wilson, HU6-7676
Press and Publicity: Mrs. Robert A. Reiter, Baltimore City, LO6-2718
Representative to Med-Chi Public Relations Committee: Mrs. H. Leonard Warres, Baltimore City, FL8-1151
Revisions and Resolutions: Mrs. John G. Ball, Bethesda, OL2-3200
Safety: Mrs. John R. Smith, Jr., Centreville, 758-0734

Montgomery County Auxiliary

The monthly luncheon meeting of the Woman's Auxiliary to the Montgomery County Medical Society was held on Tuesday, October 18, at the Linden Hill Restaurant. Mrs. Norman Oliver and Mrs. William Aud were co-chairmen of the luncheon. Mr. Ernst S. Johnston, the guest speaker, addressed the group on the subject of "Public Relations of the Medical Profession."

Mrs. Francis Mayle is chairman of the auxiliary's annual luncheon and fashion show, to be held this year on December 7 in the Regency Ballroom of the Shoreham Hotel in Washington, DC. Proceeds from this event will go toward scholarships for doctors and nurses at the University of Maryland School of Medicine.

against the usual gram-negative urinary pathogens

Why use five...where **one** will do?

In a recent 217-patient hospital study,[1] urinary tract infections were treated with a variety of widely prescribed antimicrobial agents including: a sulfonamide (40 patients), chloramphenicol (20 patients), nitrofurantoin (33 patients), nalidixic acid (30 patients), tetracycline (27 patients), colistimethate sodium (22 patients)...and 2 combinations of 5 agents each (45 patients). The 2 combinations were selected to afford maximal theoretical antibacterial coverage against the usual urinary pathogens. They were (1) tetracycline, chloramphenicol, nitrofurantoin, ristocetin and polymyxin B; and (2) tetracycline, chloramphenicol, erythromycin, nitrofurantoin and colistimethate sodium.

This clinical study shows that the two combinations of antibiotics were not superior to some of their single components. The authors point out that antibiotic antagonism often negates theoretical advantages of multiple therapy. Coly-Mycin Injectable (colistimethate sodium) was one of the single components that was shown to be equal to the combinations and eradicated bacteriuria in two-thirds of the patients.

Theoretical choice of multiple antibacterial therapy has been shown to be no more effective than one well-chosen agent which also offers least patient exposure to possible side reactions, toxicities, allergic manifestations and higher drug costs.

1. McCabe, W. R., and Jackson, G. G.: New England J. Med. *272*:1037, 1965.

in gram-negative urinary tract infections often the single well-chosen agent

Coly-Mycin® Injectable
(colistimethate sodium)

Indications: Especially indicated for the treatment of severe acute and resistant chronic urinary tract infections due to sensitive strains of gram-negative organisms. Also indicated in respiratory tract, surgical, wound and burn infections and in septicemia due to sensitive organisms. Particularly indicated when any of these infections are caused by sensitive strains of *Pseudomonas aeruginosa.*

Adverse Reactions: Occasional reactions such as circumoral paresthesias, tingling of the extremities, pruritus, vertigo or dizziness may occur. Reduction of dosage may alleviate symptoms. Therapy need not be discontinued, but such patients should be observed with extra care.

Warning: Patients should be cautioned not to drive vehicles or use hazardous machinery while on therapy.

Precautions: In cases of impaired or suspected renal impairment, use with greater caution and reduce dosage in proportion to extent of impairment. Transient elevations of BUN have been reported. As a routine precaution, appropriate blood studies should, therefore, be made during prolonged therapy.

As with all polypeptides, the possibility of muscular weakness, including apnea, due to inadvertent overdosage or normal dosage in the presence of impaired renal function, should not be overlooked. In cases of apnea, medication should be promptly discontinued and assisted respiration given until serum levels fall and normal breathing is restored.

Other antibiotics, such as kanamycin, streptomycin, dihydrostreptomycin, polymyxin, and neomycin, may also have varying neurotoxic or nephrotoxic potential. They should be used with great caution concomitantly with Coly-Mycin Injectable (colistimethate sodium).

For deep intramuscular injection only.

Dosage: By the I.M. route only, in 2 to 4 divided doses ranging from 1.5 to 5 mg./Kg./day (0.7 mg. to 2.3 mg./lb./day). Average adult dose is 2.5 mg./Kg./day (1.1 mg./lb./day). In the presence of bacteremia, septicemia, or other serious infection, greater than average doses may be required; however, maximum daily doses should not exceed 5 mg./Kg. (2.3 mg./lb.) where renal function is normal.

Not recommended against Proteus.

Colistin is also available (as colistin sulfate) in: Coly-Mycin® Pediatric for Oral Suspension (not for systemic use), and Coly-Mycin® Otic with Neomycin and Hydrocortisone.

Full information is available on request.

WARNER-CHILCOTT Morris Plains, New Jersey

The "Socio-geographic" mystery

Why is one man's gastric ulcer another man's duodenal?

Geographic variation in the *incidence* of peptic ulcer is a familiar fact. But the proclivity of certain *kinds* of ulcer for certain geographic areas is a recently recognized phenomenon.[1,2]

For example, in one particular Norwegian fishing village there is a tendency for patients to develop a gastric ulcer; anywhere else in Norway, ulcers are usually duodenal. Peruvians high in the Andes have more gastric ulcers than their compatriots in the lowlands. Why? Nobody knows.

Social variations, too. Even in the same geographic areas there are interesting variations. An Englishman's ulcer depends on his social standing—professional men suffer with duodenal ulcers, while workingmen have more of the gastric variety. In southern India the pattern is reversed. Here, duodenal ulcers are common among laborers and agricultural workers and rare among the upper classes.

Investigators are exploring every possible theoretical avenue in their search for the cause of peptic ulcer. Of all the factors implicated in ulcerogenesis, one that is generally acknowledged to be of primary importance is hypersecretion of gastric acid.[3-8] Or, as one author states it: "The medical management of peptic ulcer pharmacologically is, in the final analysis, concerned largely with the effective inhibition of peptic activity."[3]

Robinul (glycopyrrolate) provides potent, rapid, specific antisecretory action confirmed by gastric analyses and x-ray evidence of clinical effectiveness.[3,7,9-12] Relieves pain with "impressive" promptness.[8] Quickly alleviates acute discomfort, and effectively counteracts gnawing pain, preprandial midepigastric pain, belching and other ulcer symptoms.[7] Suppression of nocturnal pain is "outstanding."[13] Maximally effective doses may be given with minimal side reactions, and the incidence of unwanted anticholinergic effects is negligible.[3,7-14]

No matter what the ulcer theory... the fact is that

Robinul®

(glycopyrrolate)

promotes the essential ulcer-healing environment

A. H. ROBINS

(brief summary follows)

R10A66

Robinul®
(glycopyrrolate)
promotes the essential ulcer-healing environment

Indications: In addition to its primary indications for duodenal and gastric ulcer, Robinul (glycopyrrolate) is indicated for other GI conditions that may benefit from anticholinergic therapy. Robinul-PH Forte (glycopyrrolate 2 mg. with phenobarbital) is indicated when these situations are complicated by mild anxiety and tension.
Contraindications: Glaucoma, urinary bladder neck obstruction, pyloric obstruction, stenosis with significant gastric retention, prostatic hypertrophy, duodenal obstruction, cardiospasm (megaesophagus), and achalasia of the esophagus, and in the case of Robinul-PH Forte, sensitivity to phenobarbital.
Precautions: Administer with caution in the presence of incipient glaucoma.
Adverse Reactions: Dryness of the mouth, blurred vision, urinary difficulties, and constipation are rarely troublesome and may generally be controlled by reduction of dosage. Other side effects associated with the use of anticholinergic drugs include tachycardia, palpitation, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, drowsiness, and rash.
Dosage: Dosage should be adjusted according to individual patient response. Average and maximum recommended dose is 1 tablet 3 times a day: in the a.m., early p.m., and at bedtime. *See product literature for full prescribing information.*
Supply: Robinul (glycopyrrolate 1 mg.); Robinul Forte (glycopyrrolate 2 mg.); Robinul-PH (glycopyrrolate 1 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming); Robinul-PH Forte (glycopyrrolate 2 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming.) In bottles of 100 and 500 scored tablets.

following infection

B and C vitamins are therapy: STRESSCAPS B and C vitamins in therapeutic amounts...help the body mobilize defenses during convalescence...aid response to primary therapy. The patient with a severe infection, and many others undergoing physiologic stress, may benefit from STRESSCAPS capsules.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:	
Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

"Early in 1953 Davis and Grand undertook a review of well established practices connected with the treatment of T. vaginalis infections. For instance, it had been accepted that an acid douche should be employed. This was based on cultural studies showing that when the pH was below 5 the organisms would die. They found that the commonly used vinegar douche with a pH of 3 showed no visible effect on T. vaginalis under the microscope in 15 minutes. Both citric and lactic acid were tested with similar results. Davis then recalled that in his early treatment of T. Vaginalis infections over 30 years ago he had had his first successes with alkaline preparations, and when he returned to their use the patients reported them more soothing than the previously used acid solutions."

(Am. J. Obst. & Gynec., 68:559, 1954)

Criteria for Cleansing Douche

"Daily douching often is a part of the treatment administered in dealing with T. vaginalis and since it is possible that the solution might contain agents that could hamper the regrowth of Doederlein bacillus, the following properties were said to be ideal.

1. It should contain a harmless, nonsensitizing detergent to remove mucous deposits and debris.
2. It should not contain any antibacterial agents, since the contact possible during douching would be so fleeting that anti-bacterial action could not be expected.
3. It should be acid in pH.

The 3rd property seems to be the most illogical and unimportant. If contact is so fleeting that antibacterial actions could not be expected, it would seem to follow that its acid quality would be of no consequence. Furthermore, acid solutions are irritating to the mucosa and oftentimes accentuate inflammation.

Actually, the value of a douche is generally conceded to be confined to its use as a cleansing and deodorizing agent. The encouraging results achieved with a detergent douche solution in treating infections of the vagina are probably attributable to the enormous normal recuperative powers of the vaginal tissues which have been under-estimated as a factor in the restoration of normal physiology.

Therefore, simple cleansing of the vagina with a non-irritating, mildly alkaline douche which is soothing to the vaginal mucosa and which penetrates and flushes out the dead organisms, debris and mucinous materials frequently enables the physiological processes to overcome the infection."

Charles B. Marek, M.D., Chief of Gynecology; Bon Secours Hospital: personal communications August 11, 1964

when anxiety is part of the clinical picture

Librium®
(chlordiazepoxide HCl)

Before prescribing, please consult complete product information, a summary of which follows:

Contraindications: Patients with known hypersensitivity to the drug.

Warnings: Caution patients about possible combined effects with alcohol and other CNS depressants. Warn against hazardous occupations requiring complete mental alertness. Use caution in administering to addiction-prone patients or those who might increase dosage; withdrawal symptoms (including convulsions), following discontinuation of the drug and similar to those seen with barbiturates, have been reported. Use of any drug in pregnancy, lactation, or in women of childbearing age requires that its potential benefits be weighed against its possible hazards.

Precautions: In elderly and debilitated and in children over five, limit dosage to smallest effective amount, increasing gradually as needed and tolerated. In general, concomitant use with other psychotropics is not recommended. Paradoxical reactions have been reported in psychiatric patients and hyperactive aggressive children. Variable effects on blood coagulation have been reported very rarely in patients receiving the drug and oral anticoagulants; causal relationship has not been established clinically. Observe usual precautions in presence of impaired renal or hepatic function, impending depression and suicidal tendencies.

Adverse reactions: Drowsiness, ataxia and confusion may occur, especially in elderly and debilitated. These are reversible in most instances by proper dosage adjustment, but are also occasionally observed at the lower dosage ranges. Syncope occurs rarely. Also encountered are isolated instances of skin eruptions, edema, minor menstrual irregularities, nausea and constipation, extrapyramidal symptoms, increased and decreased libido—all infrequent and generally controlled with dosage reduction; changes in EEG patterns (low-voltage fast activity) may appear during and after treatment; blood dyscrasias (including agranulocytosis, jaundice and hepatic dysfunction) may develop occasionally, making periodic blood counts and liver-function tests advisable during protracted therapy. Individual maintenance dosages should be determined.

Dosage: *Oral*—Adults: Mild to moderate anxiety and tension, 5 or 10 mg t.i.d. or q.i.d.; severe states, 20 or 25 mg t.i.d. or q.i.d. Geriatric patients: 5 mg b.i.d. to q.i.d.

Supplied: Capsules, 5 mg, 10 mg and 25 mg—bottles of 50.

some allergens are red...

whatever their color, shape, or size...

Benadryl®

(diphenhydramine hydrochloride)

PARKE-DAVIS

for control of allergic symptoms

Whether the allergen is red and round, or unseen and unknown, BENADRYL provides relief of symptomatic distress through its antihistaminic and antispasmodic actions. *PRECAUTIONS:* Persons who have become drowsy on this or other antihistamine-containing drugs, or whose tolerance is not known, should not drive vehicles or engage in other activities requiring keen response while using this product. Hypnotics, sedatives, or tranquilizers if used with BENADRYL should be prescribed with caution because of possible additive effect. Diphenhydramine has an atropine-like action which should be considered when prescribing BENADRYL. *SIDE EFFECTS:* Side reactions, commonly associated with antihistaminic therapy and generally mild, may affect the nervous, gastrointestinal, and cardiovascular systems. Most frequent reactions are drowsiness, dizziness, dryness of the mouth, nausea, and nervousness. BENADRYL is available in Kapseals® of 50 mg. and Capsules of 25 mg. 00666

Brewer Diagnostic Kits

Complete Serological Screening Tests For Syphilis . . .

The RPR Card Tests make use of a specially prepared, carbon-containing RPR Card antigen. The particle size and other characteristics of the carbon is such that when a reactive specimen is encountered, flocculation occurs, and there is a coagglutination which is readily visible to the naked eye. Individual tests, including the collection of blood and separation of plasma can be performed in 7 to 8 minutes.

Confirming earlier findings with the RPR Card Test[1-10] Reed[11] in reporting on 63,800 specimens had an overall agreement of 98.5% in a recent comparative study with other routine screening procedures.

The RPR Card Tests, with their low cost, ease of performance, high sensitivity and specificity, are without peer in situations that demand rapid testing of patients, enabling the physician to initiate prompt treatment of early infectious syphilis.

Specify the RPR Card Test as the screening procedure on serum or plasma samples submitted to your State Approved Laboratory.

HYNSON, WESTCOTT & DUNNING, INC.

Baltimore, Maryland 21201 HW&D

When the stagnant sinus must be drained...

Transillumination of the sinuses—diffuse shadow on right side of face indicates unilateral maxillary sinusitis.

In the common cold, Neo-Synephrine is unsurpassed for reducing nasal turgescence. It stops the stuffy feeling at once. It opens sinus ostia to re-establish drainage and lessen the chance of sinusitis. With Neo-Synephrine, in the concentrations most commonly used, decongestion lasts long enough for extended breathing comfort, without endangering delicate respiratory tissue. Systemic side effects are virtually unknown. There is little rebound tendency.

Neo-Synephrine® HCl

Brand of phenylephrine hydrochloride

is available in a variety of forms, for all ages:

- 1/8% solution for infants
- 1/4% solution for children and adults
- 1/4% pediatric nasal spray for children
- 1/2% solution for adults
- 1/2% nasal spray for adults
- 1/2% jelly for children and adults
- 1% solution for adults (resistant cases)

Also NTZ® Solution or Spray
Antihistamine-decongestant

Solutions to Business Problems in Daily Medical Practice

Annual Business Review 135

How long will it take her to recover from her hip fracture if she just doesn't care?

Does she really care?
s she alert, encouraged,
ositive and optimistic
bout getting completely
ell soon?
Or has she given in to
he demoralizing impact
f confinement, disability
nd dependency?
When functional fatigue
omplicates convalescence,
Alertonic can help...

Pleasant-tasting Alertonic is pipradrol hydrochloride—an effective cerebral stimulant whose gentle analeptic action helps counteract the apathy and inertia that can often delay convalescence—together with an excellent vitamin and mineral formula, in a satisfying 15% alcohol vehicle.

Nothing fosters confidence and a sense of well-being better than your own personal warmth, understanding and encouragement together with Alertonic to help insure prompt response.

Adequate dosage is important: Prescribe Alertonic—one tablespoonful t.i.d., 30 minutes before meals...tastes best chilled.

And for your patient's sake, prescribe Alertonic in the convenient, economical one-pint bottle.

Alertonic®

Available Only On Prescription

Each 45 cc. (3 tablespoonfuls) contains: alcohol, 15%; pipradrol hydrochloride, 2 mg.; thiamine hydrochloride (vitamin B_1) (10 MDR*), 10 mg.; riboflavin (vitamin B_2) (4 MDR), 5 mg.; pyridoxine hydrochloride (vitamin B_6), 1 mg.; niacinamide (5 MDR), 50 mg.; choline,† 100 mg.; inositol,† 100 mg.; calcium glycerophosphate, 100 mg. (supplies 2% MDR for calcium and for phosphorus) and 1 mg. each of the following: cobalt (as chloride), manganese (as sulfate), magnesium (as acetate), zinc (as acetate), and molybdenum (as ammonium molybdate).

*Multiple of adult Minimum Daily Requirement supplied.
†The need for these substances in human nutrition has not been established.

Indications: 1. Functional fatigue such as that often associated with: a depressing life experience or stressful time of life; advancing years; convalescence; limited activity or confinement. 2. Poor appetite and vitamin-mineral deficiency as they occur in: patients having faulty eating habits; geriatric patients who are losing interest in food; patients convalescing from debilitating illness or surgery.

Dosage: Adults, 1 tablespoonful; children (over 15 years old), 1 to 2 teaspoonfuls; children (4 to 15 years old), 1 teaspoonful. To be taken three times daily 30 minutes before meals.

Contraindications: As with other drugs with CNS stimulating action, Alertonic is contraindicated in hyperactive, agitated or severely anxious patients and in chorea or obsessive compulsive states.

Side effects: Reports of overstimulation have been rare. Patients who are known to be unduly sensitive to the effects of stimulant drugs should be observed carefully in the initial stages of treatment.

When Professional Experience Counts

The House In The Pines Staff Is Able and Ready To Serve!

HOUSE IN THE PINES Nursing and Convalescent Homes offer efficient, round the clock care under the direct supervision of registered nurses, 24 hours a day.

The aged, convalescent and the chronically ill guests enjoy a modern, home-like atmosphere with the most up-to-date medical and therapy equipment at their side.

Complete physical and occupational therapy programs are available. The recreational programs are designed to full-fill the needs and desires of our guests.

JOHN SARGEANT — EXECUTIVE SECRETARY

EXECUTIVE COMMITTEE, NOVEMBER 3

1. The minutes of the September 9, 1966, House of Delegates meeting were adopted as published and in accordance with the Standing Rules of the House of Delegates.

2. Authority was granted for the publication of laws, rules and regulations with which physicians must comply, at a cost not to exceed $500.

3. J. T. H. Johnson, MD, was appointed as a member of the Advisory Committee to the Governor's Study Group on Vocational Rehabilitation, as a replacement for A. Gibson Packard, MD, who found it necessary to resign from this position.

4. The following appointments were approved for recommendation to the Commissioner of Motor Vehicles as members of the Medical Advisory Board of the Department of Motor Vehicles: Elijah Saunders, MD, internist; Charles E. Silberstein, MD, orthopedist; and John Edward Gessner, MD, physical medicine and rehabilitation. Drs. Saunders and Silberstein are from Baltimore City and Dr. Gessner from Baltimore County.

5. Following discussion for which William G. Speed, III, MD, chairman of the Fee Schedule Committee, was present, the Committee authorized the employment of an Actuarial Consultant to determine how the Health Department arrived at its Title XIX program figures for medical care items; to check the accuracy of those figures; and, if necessary, to advise the Faculty as to how correct data can be obtained. An expenditure of up to $2,000 for this project was approved, with the proviso that additional funds may be requested if necessary.

6. Eleven members of the Faculty were selected for appointment to the Physicians' Review Committee, Blue Cross, either as replacements or reappointments, and three were designated as available alternates.

7. The Executive Secretary reported receipt of an unsatisfactory reply to a letter he had written to the Maryland Hospital Commission asking whether or not it would endorse certain principles set forth in a report of a Survey of Hospital Facility and Service Needs for the State of Maryland by the firm which conducted the survey. The Committee voted unanimously for pursuit of the matter with the understanding that these principles were at variance with the feelings of the medical profession.

8. Approval was granted the Executive Secretary to serve in the following capacities: member, Board of Directors, Maryland Health Fair, Inc.; president, Mid-Atlantic Chapter, American Medical Writers Association; representative of the Board of Health and Mental Hygiene on the Board of Directors of the Hospital Cost Analysis Service, Inc.

9. Copies of a report of payments by Blue Shield to Hospital Educational Funds through June 30, 1966, were distributed for the information of Committee members.

10. Acting upon the report, in an anonymous letter, that compulsory assessment of medical staff members exists at St. Joseph

Hospital and at the Maryland General Hospital, the Committee voted to ascertain the accuracy of the information.

11. The reappointment of Kent E. Robinson, MD, as Faculty representative on the Advisory Council on Mental Hygiene was approved.

12. The Committee approved the appointment, suggested by the Subcommittee chairman, of J. Roy Guyther, MD, Mechanicsville, as a member of the Subcommittee of the Advisory Council for Higher Education.

13. The Committee was informed that Leonard Flax, MD, had filed an appeal of the Committee's decision of October 6 with the Judicial Council of the American Medical Association.

14. Russell A. Nelson, MD, joined the meeting to enlighten the Committee on the Johns Hopkins Hospital plan to bill government agencies for services rendered by Assistant Physicians (formerly Senior Residents). Dr. Nelson explained that the latter are licensed to practice medicine in Maryland, are fully qualified to receive payments under Title XVII, Part B, of the Medicare program, and are legally permitted to do so provided that their salaries are not included in the costs reimbursed under Part A, Title XVIII. There was extensive discussion of far-reaching effects of a system whereby the Assistant Physicians would be paid on a fee-for-service basis and would assign such funds to the hospital. Inasmuch as final regulations on payments for in-hospital medical care of patients have not been issued, it was acknowledged that the question of how such payments would be handled could not be answered at present.

ACHROCIDIN®

Tetracycline HCl-Antihistamine-Analgesic Compound

Each tablet contains:

ACHROMYCIN® Tetracycline HCl	125 mg
Phenacetin	120 mg
Caffeine	30 mg
Salicylamide	150 mg
Chlorothen Citrate	25 mg

The patient can feel better while getting better. ACHROCIDIN brings the treatment together in a single prescription—prompt symptomatic relief together with early, potent control of the tetracycline-sensitive organisms frequently responsible for complications leading to prolonged disability in the susceptible patient.

Effective in controlling complicating tetracycline-sensitive bacterial infection and providing symptomatic relief in allergic diseases of the upper respiratory tract.

Contraindication—History of hypersensitivity to tetracycline.

Warning—If renal impairment exists, even usual doses may lead to liver toxicity. Under such conditions, lower than usual doses are indicated and if therapy is prolonged, tetracycline serum level determination may be advisable. Hypersensitive individuals may develop a photodynamic reaction to natural or artificial sunlight during use. Individuals with a history of photosensitivity reactions should avoid direct exposure while under treatment and treatment should be discontinued at first evidence of skin discomfort.

Precautions—Some individuals may experience drowsiness, anorexia, and slight gastric distress. If excessive drowsiness occurs, it may be necessary to increase the interval between doses. Persons on full dosage should not operate any vehicle. Use may result in overgrowth of nonsusceptible organisms. If infections appear during therapy, appropriate measures should be taken. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Infections caused by beta-hemolytic streptococci should be treated for at least 10 full days to help prevent rheumatic fever or acute glomerulonephritis. Use of tetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect has been observed in usual short treatment courses.

Average adult dosage: 2 tablets four times daily, given at least one hour before, or two hours after meals.

EXECUTIVE SECRETARY'S NEWSLETTER

December, 1966

EMINDER ON BILLING

The State Health Department advises that some physicians are not billing for medical care patients at the usual, customary and reasonable fees as recommended by the House of Delegates at the Ocean City meeting this year.

The Commissioner has requested this be brought to the attention of all members so they may comply with the ruling of the House of Delegates. Payments will be made at the current schedule, but this additional information will assist the Health Department in its collecting of data for payments when sufficient funds are appropriated for implementation of the usual, customary and reasonable concept.

CHILD ABUSE LAW

The attention of all physicians is brought to the Child Abuse Law, which requires their reporting of suspected child abuse cases to the local welfare department, within 24 hours of the treatment of the child. For cases seen at the hospital, the responsibility lies with the Hospital Administration.

NEW SMALLPOX CERTIFICATES

New Smallpox vaccination certificates go into use for vaccinations performed on and after January 1, 1967. The new certificate requires the indication as to whether a freeze-dried or liquid vaccine was used, as well as the origin and batch number of the smallpox vaccine.

Current certificates authenticated prior to January 1, 1967, will continue in use until they expire.

RESOLUTIONS FOR ANNUAL SESSION

Resolutions for consideration at the Faculty's Annual Meeting should be received in the Faculty office by:

WEDNESDAY, FEBRUARY 22, 1967

The Reference Committee will meet to consider the resolutions received on Wednesday, March 29, 1967, at 8:00 p.m., in the Faculty building, 1211 Cathedral Street, Baltimore.

NEWS NOTES

Selvin Passen, M.D., Baltimore, has joined the offices of Drs. Guerin, Kime and Sherrer for

the practice of Laboratory Medicine

Milton Markowitz, M.D., Baltimore, has been named President of the Heart Association of Maryland.

Ulgan I. Sila, M.D., Baltimore, has announced the opening of her office for the practice of Pediatrics at 3100 St. Paul Street.

Abraham Genecin, M.D., Baltimore, is the new President of the Maryland Society of Internal Medicine. Other officers include: John C. Harvey, M.D., President-elect; Barnett Berman, M.D., Secretary-Treasurer.

New Junior members of the American Society of Anesthesiology include: Harry Cohen, M.D., Martino M. Almogela, M.D., Simeon Boongaling Alvaran, M.D., Baltimore; and Fredric Stuart Taylor, M.D., Bethesda.

A new Fellow of the American College of Anesthesiology is Y. Victor Kent, M.D., of Baltimore.

New officers of the Maryland Orthopedic Society include: A. Gibson Packard, Jr., M.D., President; George N. Austin, M.D., President-elect; and Elroy Young, M.D., Secretary-Treasurer.

RARE BOOK OFFER

Mr. Stanley S. Slotkin, Founder and Chairman of the Board of Abbey Rents, is making available to physicians in Maryland pages from rare books held in his personal antiquarian library. The pages are from rare Medical and Biblical texts.

Copies may be obtained through Abbey Rents office in Baltimore, either by telephone or in person. There is no obligation.

against the usual gram-negative urinary pathogens

Why use five...where **one** will do?

In a recent 217-patient hospital study,[1] urinary tract infections were treated with a variety of widely prescribed antimicrobial agents including: a sulfonamide (40 patients), chloramphenicol (20 patients), nitrofurantoin (33 patients), nalidixic acid (30 patients), tetracycline (27 patients), colistimethate sodium (22 patients)... and 2 combinations of 5 agents each (45 patients). The 2 combinations were selected to afford maximal theoretical antibacterial coverage against the usual urinary pathogens. They were (1) tetracycline, chloramphenicol, nitrofurantoin, ristocetin and polymyxin B; and (2) tetracycline, chloramphenicol, erythromycin, nitrofurantoin and colistimethate sodium.

This clinical study shows that the two combinations of antibiotics were not superior to some of their single components. The authors point out that antibiotic antagonism often negates theoretical advantages of multiple therapy. Coly-Mycin Injectable (colistimethate sodium) was one of the single components that was shown to be equal to the combinations and eradicated bacteriuria in two-thirds of the patients.

Theoretical choice of multiple antibacterial therapy has been shown to be no more effective than one well-chosen agent which also offers least patient exposure to possible side reactions, toxicities, allergic manifestations and higher drug costs.

1. McCabe, W. R., and Jackson, G. G.: New England J. Med. 272:1037, 1965.

in gram-negative urinary tract infections often the single well-chosen agent

Coly-Mycin® Injectable
(colistimethate sodium)

Indications: Especially indicated for the treatment of severe acute and resistant chronic urinary tract infections due to sensitive strains of gram-negative organisms. Also indicated in respiratory tract, surgical, wound and burn infections and in septicemia due to sensitive organisms. Particularly indicated when any of these infections are caused by sensitive strains of *Pseudomonas aeruginosa*.

Adverse Reactions: Occasional reactions such as circumoral paresthesias, tingling of the extremities, pruritus, vertigo or dizziness may occur. Reduction of dosage may alleviate symptoms. Therapy need not be discontinued, but such patients should be observed with extra care.

Warning: Patients should be cautioned not to drive vehicles or use hazardous machinery while on therapy.

Precautions: In cases of impaired or suspected renal impairment, use with greater caution and reduce dosage in proportion to extent of impairment. Transient elevations of BUN have been reported. As a routine precaution, appropriate blood studies should, therefore, be made during prolonged therapy.

As with all polypeptides, the possibility of muscular weakness, including apnea, due to inadvertent overdosage or normal dosage in the presence of impaired renal function, should not be overlooked. In cases of apnea, medication should be promptly discontinued and assisted respiration given until serum levels fall and normal breathing is restored.

Other antibiotics, such as kanamycin, streptomycin, dihydrostreptomycin, polymyxin, and neomycin, may also have varying neurotoxic or nephrotoxic potential. They should be used with great caution concomitantly with Coly-Mycin Injectable (colistimethate sodium).

For deep intramuscular injection only.

Dosage: By the I.M. route only, in 2 to 4 divided doses ranging from 1.5 to 5 mg./Kg./day (0.7 mg. to 2.3 mg./lb./day). Average adult dose is 2.5 mg./Kg./day (1.1 mg./lb./day). In the presence of bacteremia, septicemia, or other serious infection, greater than average doses may be required; however, maximum daily doses should not exceed 5 mg./Kg. (2.3 mg./lb.) where renal function is normal.

Not recommended against Proteus.

Colistin is also available (as colistin sulfate) in: Coly-Mycin® Pediatric for Oral Suspension (not for systemic use), and Coly-Mycin® Otic with Neomycin and Hydrocortisone.

Full information is available on request.

AMA President-elect Will Address Faculty at Annual Meeting in April

Among the prominent, nationally known physicians who will address the Medical and Chirurgical Faculty of the State of Maryland at its 169th Annual Meeting in April is Milford O. Rouse, M.D., President-elect of the American Medical Association.

Dr. Rouse has been clinical professor of medicine at the University of Texas Southwestern Medical School since 1943, and is in private practice in Dallas. He was born in Jacksonville, Texas, and, as the son of Southern Baptist missionaries, he spent part of his boyhood in Cuba and Brazil. His desire to become a physician dates back to the age of five, when he was stricken with meningitis and a Brazilian doctor saved his life.

After receiving his BA and MA degrees from Baylor University, Dr. Rouse received his MD from its College of Medicine, and interned at Ft. Sam Houston Station Hospital. He has contributed more than a score of papers and medical articles to journals throughout the country.

In 1958-1959, Dr. Rouse was president of the Southern Medical Association, and he has also served as president of the Texas Medical Association. He is a diplomate of the American Board of Internal Medicine and of the subspecialty Board of Gastroenterology, and is a fellow of the American College of Physicians.

Milford O. Rouse, MD

Dr. Rouse was chosen President-elect of the AMA in June, 1966, and will take office as the Association's 122nd President in June, 1967. Previous to his election he served as speaker of the House of Delegates of the AMA, beginning in 1963, and prior to that he was vice-speaker of the House for four years.

"Prophylaxis of Peptic Ulcer" will be the title

Only JOBST supports are custom made from precise measurements of the individual extremity.

JOBST Service Centers:
818 Eighteenth St., N.W.
Washington, D.C. 20006 — Ph. 298-5530
Suite 415 Medical Arts Building
101 W. Read St., Baltimore, Md. — Ph. 539-0560

When the patient's extremity is carefully measured with the unique JOBST Measuring Tape, it marks the second step toward providing him with a custom-made VENOUS PRESSURE GRADIENT support. The first step begins with a prescription. Your prescription. With your diagnosis and indication for the correct counter pressures to be engineered into the support. JOBST supports are widely used in treatment of stasis dermatitis, postmastectomy lymphedema, postural hypotension, post-fracture, post-operative and injury edema. Trained experts will measure and fit your patients for you at one of our convenient Service Centers.

Other Speakers

Other eminent physicians scheduled to present papers at the Annual Meeting in April are Michael E. DeBakey, MD, professor of surgery, Baylor University College of Medicine; James F. Holland, MD, chief of medicine, Roswell Park Memorial Institute; Walter L. Henry, Jr. MD, professor of medicine, Howard University; Edgar S. Gordon, MD, professor of medicine, University of Wisconsin Medical Center; John W. Walsh, MD, clinical professor of OB-GYN, Georgetown University School of Medicine; and Richard E. Palmer, MD, clinical professor of pathology, George Washington University School of Medicine.

James B. Brooks, MD, of Baltimore, is chairman of the Committee on Program and Arrangements for the Meeting.

New
ow-cost tetracycline/antifungal therapy

for broad-spectrum activity
plus specific antifungal prophylaxis
at significant patient savings

Whenever tetracycline is indicated in these candidates for Candida:

ic patients

2. nonpregnant women with a history of recent or recurrent monilial vaginitis

3. elderly or debilitated patients

ts with a past history of moniliasis

5. patients on long-term tetracycline or corticosteroid therapy

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms, in patients with increased susceptibility to monilial infections. *Contraindications:* The drug is contraindicated in patients hypersensitive to its components. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, serologic tests for syphilis should be conducted initially and monthly for 3 months. *Adverse Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis, and allergic reactions may occur. *Usual Adult Dosage:* 1 capsule *q.i.d.* Continue therapy for 10 days in beta-hemolytic streptococcal infections. Administer one hour before or 2 hours after meals. *Supply:* Capsules, bottles of 16. Each capsule contains tetracycline phosphate complex equivalent to 250 mg. tetracycline HCl activity and 250,000 units of nystatin.

ETHICS SEMINAR FOR INTERNS AND RESIDENTS

A Summary

EDWIN J. HOLMAN, LLB
Director, Department of Medical Ethics
American Medical Association

The Ethics Seminar summarized here by Mr. Holman was held on Saturday, October 15, under the sponsorship of the Mediation Committee of the Medical and Chirurgical Faculty of the State of Maryland. At the morning session a panel of five physicians, representing as many different fields of medicine and surgery, pointed out problems in ethics which new doctors could expect to face upon entering practice. A round-table discussion in the afternoon dealt with the continuing questions of ethics which arise in the physician's relationship to the patient and to the community.

The Mediation Committee of the Medical and Chirurgical Faculty of Maryland is to be congratulated for having held this Seminar on Ethics for Interns and Residents. As J. S. Eastland, MD, said in moderating his panel, "As a baby is vulnerable at birth, so is the young physician on entering practice." The efforts of the medical society to reduce that vulnerability should be redoubled for the benefit of the public and the profession.

On Entering Practice

During the morning program, which consisted of a formal presentation of papers, several attempts were made to define ethics. One description of ethics not noted was that of Homer L. Pearson, MD, past chairman of the AMA's Judicial Council. He said that medical ethics distilled the best of the past to serve the needs of the present and provide for the advances that must be expected in the future. The panelists in the morning program seemed to base their discussions on just such a description.

Lewis P. Gundry, MD, speaking from the viewpoint of an internist, discussed the importance of hospital affiliations and the location of a physician's office in relation to his practice and to the hospitals with which he is affiliated. He described the proper forms of announcements to be used by physicians on entering practice and then spoke of the very practical matter of handling referrals. He emphasized that it is but a matter of courtesy to keep the physician who made the referral advised. He pointed out some of the difficulties that all physicians experience with referrals because patients may wish to change physicians for reasons best known to themselves. He discussed fees and emphasized that a physician should use common sense in establishing fees for his patients.

Dr. Gundry pointed out that physicians have to be tactful for the benefit of the individual patient and for the benefit of their colleagues in the medical profession. He suggested that physicians should review their practices regarding emergency care. He said that a physician is obligated to re-

spond to emergencies although, admittedly, the physician must use judgment in deciding what is an emergency. Occasionally, Dr. Gundry noted, a physician is called upon to see the patient of another physician during the latter's absence. He emphasized this is but a temporary arrangement and should be understood and treated as such.

Louis J. Kolodner, MD, representing the specialty of surgery, stressed the fact that ethics impose a self-discipline on the individual, a self-discipline that must be recognized and observed because of the idealism and nobility of the medical profession. He pointed out that the young physician wishes to be ethical in every respect. Many pressures, however, most of them economic, are exerted on all physicians and, as a result, the young man is subjected to many temptations.

Dr. Kolodner discussed the advantages and disadvantages of group practice and the absolute undesirability of fee-splitting. With regard to the latter subject, he said that economic pressures of many sorts make fee-splitting an ever present problem which must be vigorously attacked by physicians.

In connection with the increasing use of the emergency room by individuals, Dr. Kolodner stressed the point that the emergency room physician has an ethical and professional obligation to his colleagues to keep them adequately informed as to the nature of the emergency treatment and thus ensure the continuing care of a patient by his own physician.

Dr. Kolodner referred to some of the hazards a physician faces in everyday practice, particularly in regard to minor surgery and "compensation" practice. He said that the performance of minor surgery in a physician's office is probably not in the physician's best interest because of the danger of medical-legal involvements. He suggested that the physician use the emergency room or the out-patient department of a hospital for minor surgery. In connection with "compensation" practice, he said that the individual physician must always conduct himself in a manner which will reflect credit on the good name of the medical profession. Dr. Kolodner pointed out that all physicians have obligations not common to other men in connection with the organized activities of the medical profession. He urged all to participate actively in medical staff and medical society activities which are designed to benefit the public and to improve the medical profession.

Robert B. Goldstein, MD, also speaking on behalf of surgeons, emphasized certain key ethical concepts in medical practice, particularly those involving physician-physician relationships. He stated that it is most important to maintain close contact with a referring physician and to keep him advised of the course of treatment and the patient's condition. He stressed the importance of the specialist's recommending further referral with the advice of the attending physician. The ethical physician will not hesitate to use consultants, Dr. Goldstein said, and as a matter of fact the good physician will use consultants who are more expert because this is for the patient's benefit. He also pointed out that a physician's attendance at scientific meetings was important for his patient's benefit.

John M. Dennis, MD, representing radiology, stated that inasmuch as the patient pays for services, he deserves what he pays for. As a matter of fact, the patient deserves the best. Commenting on the desire of non-specialists to engage in specialized procedures on the assumption that they are helping their patients both scientifically and economically, Dr. Dennis pointed out that physicians who do this may be in error because they do not have the training the specialist has nor do they have his equipment. He knew of instances in which physicians had bought second-hand equipment for use in a specialty other than their own and this equipment, according to Dr. Dennis, was not always the best equipment, nor was it always properly calibrated or adjusted. Even in so-called routine procedures, he pointed out, the use of such equipment subjected both the physician and the patient to harm. Dr. Dennis also noted that the physician who engages in a specialty other than his own is frequently not prepared to cope with emergencies or extraordinary happenings, to his patient's detriment. He believes that the specialist engaging exclusively in his own particular practice best serves the patient and the attending physician.

Watson S. Kime, MD, representing pathology, suggested that the young man entering practice, although he wants to be ethical, is not always aware of what is ethical and what is not. He said that it is the obligation of physicians in practice to make certain that the young man entering practice

is educated in the spirit and intent of medical ethics. He stated that the practicing physician should impart his knowledge of this field to his colleagues and to his employees in order to develop a deep understanding and appreciation of ethical principles among all who assist in patient care.

Discussing laboratory procedures from a practical point of view, Dr. Kime pointed out that the physician can (a) have laboratory work done in his own office, (b) send a specimen to a laboratory, or (c) send the patient to the laboratory. He suggested that when the physician attempts to do laboratory procedures in his own office, time and equipment and knowledge are essential. He questioned whether the busy practitioner could afford the necessary equipment, devote the necessary time and develop the necessary knowledge to provide adequate service for the patient. He admitted that properly trained technicians could be used by the non-pathologist if a physician maintained his own laboratory, but implied that, even so, there would be enumerable difficulties for the nonpathologist.

In connection with laboratories themselves, Dr. Kime said that he had a basic rule, "If you send out, see it." He urged that every physician who plans to use the facilities of any laboratory visit and inspect the laboratory, its facilities, its procedures, and its personnel. He stressed the fact that a physician relying on a labortory is entitled to know the quality of the services offered and, furthermore, that a physician is obligated to his patient to use or to recommend laboratories that are competent in all respects to perform the services requested.

Finally, Dr. Kime cautioned physicians not to be taken in by some of the practices of some laboratories. He pointed out that some laboratories will provide office space for a physician who will permit the use of his name on the laboratory's letterhead. Others offer a physician all the laboratory work he needs for a small flat monthly sum, and still others offer physicians shares of corporative stock. Dr. Kime said that these proposals can be presented in a most attractive way and that occasionally a physician, without thinking, accepts one of these proposals. They are obviously not in the best interest of the physician or the patient. Many of them, he cautioned, amount to fee-splitting and solicitation of patronage, and none of them redounds to the credit of the medical profession.

Ethical, Legal and Moral Responsibilities

The afternoon session, in contrast to the formal morning session, featured a round table discussion. Panel members were William A. Pillsbury, MD, general practice secretary of the Medical and Chirurgical Faculty; Karl F. Mech, MD, surgeon and treasurer of the Faculty; W. Bradley King, MD, chief of pathology at Maryland General Hospital; and John King, legal counsel to the Faculty. William Y. Rial, MD, moderator, maintained a steady discussion of various ethical implications involved in actual medical practice.

Among the questions discussed from varying points of view were: What protection should medicine give the agitated patient, that is, the patient who may inflict harm on himself or another? What is the physician's ethical responsibility to an agitated individual who is in police custody or when law enforcement authorities seek medical assistance for the benefit of such an individual or his family? In discussion of this line of questions, the responsibilities of the physician as an attending physician, as a family physician, and as a member of the community, were explored. Mr. King pointed out that fear of litigation is not an acceptable excuse, from the ethical point of view, for failure to fulfill a professional obligation.

The subject of confidences arising from the physician-patient relationship provoked a considerable amount of discussion. When, if ever, it was asked, may a physician disclose confidences acquired during the physician-patient relationship? Reference was made to situations in which the physician has knowledge of an individual's personality, or character, or physical disabilities, of such nature that disclosure to a third party might prevent harm to the community at large. Another facet of the subject was examined as a result of the question, What would you do if a pregnant unmarried minor sought your professional service and insisted that you not divulge the nature of her condition to her parents? A lively and spirited discussion of this question indicated no unanimity of thinking among the members of the medical profession. Indeed, no conclusions were reached either on the general subject of divulging a patient's confidences, or on any of its diverse aspects.

Another topic at the afternoon session was the opinion said to prevail among the public that physicians protect one another. Legal counsel for the Faculty suggested that there is some basis for the public's point of view and that the invocation of the doctrine of *res ipsa loquitur* stems from this practice.

In addition there was a discussion of the difference between privileged communications and confidential communications, and a discussion of the newly enacted Maryland statute which permits the application of the doctrine of privilege to psychiatric treatment conducted by a psychiatrist or a psychologist. The doctrine of privilege in Maryland does not extend to all physician-patient relationships.

There was also discussion of medical examiner cases in Maryland and of laboratory procedures in general. It was urged that a physician use the golden rule in connection with requests for laboratory procedures.

In general, the afternoon session touched upon the subjects of confidentiality, physician-patient relationships in general, physician-community relations, and physician-hospital relations. There was no mention of clinical investigation, the effect of automation, or the matter of relations between physicians and allied health professions and services.

Permeating the discussion were recognition of "benefit to the patient" and the application of the golden rule. Time after time, in one way or another, it was said that the physician should do unto others as he would have them do unto him.

What was not said at the Seminar was as important as what was said. The very fact that the conference was held indicates that medicine is trying to insure the observance of ethical principles and concepts. Even though not enough is being done or ever will be done, medicine should be proud of what it is doing, of its efforts to avoid evil and do good.

Development of a New Carotid Artery Aneurysm in a Patient with a Previously Operated Ipsilateral Carotid Aneurysm

CHARLES M. HENDERSON, MD
Instructor in Neurological Surgery
University of Maryland School of Medicine

JOHN E. ADAMS, MD
Professor of Neurological Surgery
University of California School of Medicine

PAUL D. MEYER, MD
Instructor in Neurological Surgery
University of Maryland School of Medicine

A case of the development of a right carotid saccular aneurysm at a point one cm superior to a previous aneurysm is presented. Current theories of pathogenesis are presented and discussed. Once again, caution is urged regarding prognosis in patients who are operated upon for an angiographically single lesion.

In recent years the subject of cerebral arterial aneurysms has received much attention, and a great deal of information has been gathered pertaining to their natural history and operative treatment. It is generally accepted that multiple aneurysms occur in 15% of all patients in whom this diagnosis is established. To the best of our knowledge, however, the development of a new aneurysm on the same vessel at a point one cm from a previously operated lesion has never been reported in the literature and is the basis for this case report.

Case Report

This 34-year-old white male (J.E.A.), was first seen by one of us at the Oakland Naval Hospital in 1951 at the age of 19. The chief complaint at this time was severe right frontal headache. Past history revealed two previous bouts of subarachnoid hemorrhage, and physical examination revealed only a right third nerve palsy. Right carotid angiography was performed, and an aneurysm arising from the internal carotid artery at the junction of the posterior communicating artery was clearly demonstrated. At operation, silver clips were placed across the neck of the lesion, and the carotid was visualized up to its point of bifurcation into the anterior and middle cerebral arteries. There was no indication of another lesion on this vessel at this time, either by angiography or by direct visualization. His postoperative course was uneventful and, with the exception of an incomplete third nerve palsy and a mild left hemiparesis, he remained asymptomatic until April, 1964. At that time, he again developed right sided headache unassociated with nausea, vomiting, syncope, or paresis.

At the time of his admission to University Hospital in Baltimore, his general physical examination was within normal limits. Neurological examination revealed the patient to be fully conscious and oriented in all spheres. An incomplete third nerve palsy with associated diplopia was present on the right, and a mild hypesthesia and hypalgesia without motor deficit were demonstrable in the left arm and hand. The remainder of the

neurological examination was within normal limits.

Lumbar puncture revealed crystal clear fluid under normal pressure. A right carotid angiogram (see Figure) demonstrated the presence of a saccular aneurysm arising from the internal carotid artery at a point one cm superior to the site of the old lesion. On approach to the lesion through a right front-temporal craniotomy, it was noted that the anterior portion of the temporal lobe contained a large cyst which was probably due to hemorrhage into the area during a previous bout of bleeding. The infundibulum of the old aneurysm was identified and several clips could be seen across its neck. One cm superior to the old lesion, the new aneurysm was visualized and a Mayfield clip was placed across its fundus. The patient did well postoperatively with the exception of a mild cellulitis in the lower border of the wound which responded to conservative antibiotic therapy. Repeat bilateral carotid angiograms revealed good occlusion of both aneurysms and no further demonstrable lesions. When seen one year postoperatively, he was neurologically normal except for a persistent incomplete right third nerve palsy.

Discussion

The exact etiological factors in the development of saccular aneurysms still remain obscure, and relatively little new data has been forthcoming since the early works of Forbus[2] and Bremer.[1] Forbus felt that these lesions were due to a defect in the tunica media at the point of branching or junction of arteries, coupled with degenerative changes in the internal elastic membrane from continuous intravascular pressure. This theory could adequately explain the first lesion, but could hardly apply to the second since it did not occur in an area of bifurcation or branching along the parent vessel.

Bremer, and later Padget,[4] implicated persistent vessels of the embryonic capillary network as a possible factor in the pathogenesis of these lesions. These vessels, which may be blind arteries, vasa vasorum, or branches of meningeal vessels, have been shown to arise from main arteries, usually at right angles, and enter the muscularis as endothelial tubes surrounded by connective tissue or a thin muscular layer. If persistent, they may represent an area of structural weakness in the wall of the parent vessel which could expand to form an aneurysm under the influence of altered intravascular pressure. This concept is certainly attractive when one attempts to explain the second lesion especially in view of its locations, but more so in view of the fact that the hemodynamics in the parent vessel might well have been altered by the first operation.

Unfortunately, neither this case nor the one of Graf and Hamby[3] aid in clarifying this problem, but both should make us more cautious regarding prognosis in patients who have been successfully operated upon for a single demonstrable lesion.

ANNOUNCING a potent combination in truly delicious orange-flavored forms:

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

in chewable tablets

in granules for oral suspension

When combination antibiotic therapy is indicated...

CONSIDER: an exceptionally high cure rate in susceptible infections

The rationale: When combined, Erythrocin and the trisulfapyrimidines (triple sulfas) are indicated in infections that are more susceptible to the combination than to either agent alone. Such conditions are usually found in urinary, lower respiratory tract and chronic ear conditions.

The results: Clinical studies involving 142 young patients showed *an overall cure rate of 96.5%*. Side effects were experienced by only four of the patients.

The acceptance: The majority of the 142 patients studied expressed a definite liking for the products. *There were only two refusals.* An independent taste-test with 50 healthy children further substantiated the excellent acceptability of the orange-flavored forms.

602061

ERYTHROCIN®-SULFAS

ERYTHROMYCIN ETHYL SUCCINATE–TRISULFAPYRIMIDINES

In Chewable Tablets
In Granules for Oral Suspension

ERYTHROCIN®-SULFAS
Brief Summary

Indications: Use Erythrocin-Sulfas in infections more susceptible to the combination than to either agent alone. These are usually found in urinary, lower respiratory tract, and chronic ear infections.

Contraindications: Known sensitivity to erythromycin or sulfonamides. Because of the possibility of kernicterus with sulfonamides, do not use in pregnancy at term, premature or new born infants.

Warnings: As with other forms of sulfonamide therapy, carefully evaluate patients with liver or kidney damage, urinary obstruction, or blood dyscrasia. Deaths have been reported from hypersensitivity reactions and blood dyscrasias following use of sulfonamides. Perform blood counts and liver and kidney function tests if used repeatedly at close intervals or for long periods.

Precautions: Use sulfonamides with caution in patients with a history of allergy. Assure adequate fluid intake to prevent crystalluria and institute alkali therapy if indicated.

Adverse Reactions: Sulfonamide therapy may be associated with headache, nausea, vomiting, urticaria, diarrhea, hepatitis, pancreatitis, blood dyscrasias, neuropathy, drug fever, skin rash, injection of the conjunctiva and sclera, petechiae, purpura, hematuria and crystalluria.

Side effects due to erythromycin are infrequent, but occasional abdominal discomfort, nausea, or vomiting, urticaria and other skin rashes may occur.

If a reaction or overgrowth of nonsusceptible organisms occurs, withdraw the drug.

Supplied: The Granules for Oral Suspension come in bottles of 60 ml. and 150 ml. The Chewable tablets are in bottles of 50. Each 5-ml. teaspoonful of reconstituted Granules or each Chewable tablet provides erythromycin ethyl succinate equivalent to 125 mg. of erythromycin activity and 167 mg. each of sulfadiazine, sulfamerazine and sulfamethazine. 603303

The Science of Communication as practiced at Monumental Printing

It's more than a science: it's an Art, the precise transliteration in print of an intangible idea for a heterogeneous group of critical readers.

Here, at Monumental Printing, we learned to handle the tools of intelligent communication by the empirical method: working with them. The brush and palette of our art, the chisel, the score, the script are simply words on paper. We learned their proper use over 50 years of practice by being permitted to print such Journals as:

Clinical Chemistry
Digestive Diseases
Fertility & Sterility
Occupational Medicine
Leprosy
Mental Hospitals
Psychiatric Studies and Projects
Psychosomatic Medicine

We speak your language. We know the difference between edema and enema; syndrome and symptom; sewage and sewerage. And when and why we should use 12 point Caslon Bold instead of 10 point Stymie.

If you, too, need a good printer, let's communicate!

MALIGNANT TUMORS OF THE PAROTID GLAND

R. ROBINSON BAKER, MD
Advanced Clinical Fellow, American Cancer Society
Assistant Professor, Department of Surgery,
The Johns Hopkins University School of Medicine

The clinical management of 38 patients with malignant tumors of the parotid gland is described. These tumors occur with equal frequency in both males and females. Pain in the region of the parotid tumor, facial nerve palsies, and palpable cervical nodes are clinical signs of the more malignant parotid tumors. The histologic patterns of various parotid tumors are discussed. Treatment policies, based on the clinical course and histologic pattern of the various types of parotid tumors, are defined.

The majority of parotid tumors are benign mixed tumors, or Warthin's tumors, which can be cured by parotidectomy with preservation of the seventh nerve. Approximately 25% of parotid tumors are malignant, however. These present a wide variation in histologic pattern which is reflected in a similar variation in their clinical behavior. Radical surgical excision of the parotid gland is associated with serious cosmetic and functional deformities secondary to excision of the facial nerve and portions of the mandible. It should therefore be undertaken only in the presence of firm indications associated with a reasonable chance of ultimate cure.

In an effort to delineate further the role of surgical excision in the management of malignant parotid tumors, the experience at The Johns Hopkins Hospital has been reviewed.[1] This series consisted of 38 patients, 17 males and 21 females. The patients ranged in age from 17 to 84 years, but the disease was most commonly encountered in the fourth and fifth decades. Patients with benign parotid tumors usually gave a history of a painless mass in the tail of the parotid gland which had been present for several years. Although both benign and malignant tumors can be present for a number of years without change in size, 40% of the patients with malignant tumors gave a history of a recent increase in the size of a previously quiescent mass.

Untreated benign tumors are rarely associated with any symptoms other than the presence of a mass. Benign parotid tumors usually present as a symmetrical, freely mobile, non-tender mass, which is characteristically present in the tail of the parotid gland. There are no associated physical findings.

Pain in the region of the parotid gland and partial paralysis of the musculature of the face are almost always indications of malignancy (in this series, 21% of the patients gave a history of pain in the region of the parotid gland and 7% detected paralysis of the facial nerve). Fixation of the mass and ulceration of the overlying skin are additional indications of malignancy. Facial nerve palsy (see Figure) and palpable cervical nodes are almost pathognomonic of malignancy.

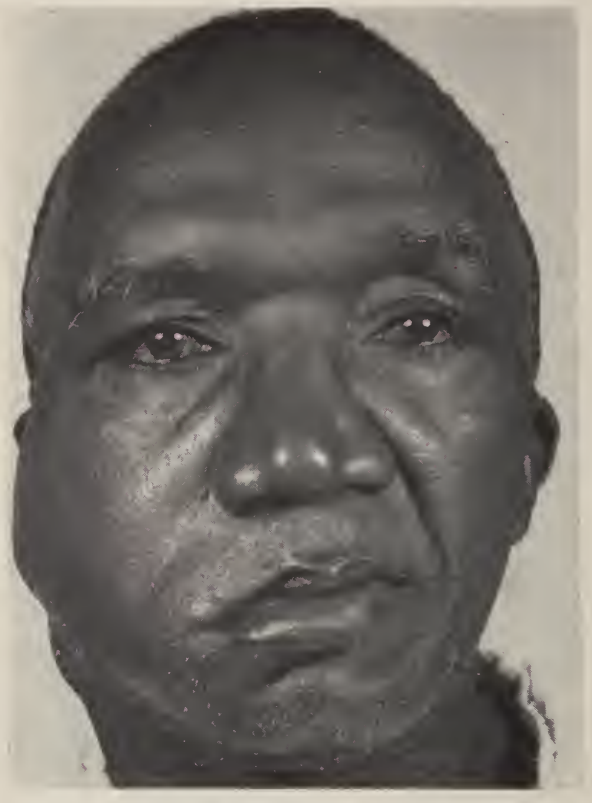
Pathology

On the basis of histologic section, malignant parotid tumors can be divided into three general patterns:

(1) *Anaplastic carcinomas, squamous carcinomas, high grade muco-epidermoid carcinomas and glandular adenocarcinomas*—These tumors usually pursue a rapid clinical course associated with a high incidence of cervical lymph node metastasis and systemic metastasis.

(2) *Adenoid cystic carcinomas, acinic cell carcinomas, and malignant mixed tumors*—These tumors are characterized by a prolonged clinical course, with eventual death from local extension of the tumor; cervical lymph node metastases and distant metastases are usually only associated with extremely large primary tumors which have been present for a prolonged period of time.

(3) *Mid- and low-grade muco-epidermoid carcinomas*—These are relatively benign and remain confined to the parotid gland for long periods of time. Metastases to the cervical lymph nodes are extremely uncommon.



Treatment

All parotid tumors should be explored and an histologic diagnosis established, preferably by frozen section. If the diagnosis cannot be established on frozen section, definitive therapy should await permanent histologic sections.

Once a diagnosis of malignancy is established by histologic section, further therapy should be based on the clinical course and histologic pattern of the tumor. Radical surgical excision of the gland and facial nerve with an associated radical neck dissection is indicated in selected cases. An appreciable number of patients can be cured, however, by an operation, which is associated with considerably less morbidity.

The histologic diagnosis of high grade muco-epidermoid, anaplastic, and squamous carcinomas appears to be a firm indication for a radical parotidectomy with excision of the facial nerve, excision of a portion of the mandible if necessary and, in continuity, radical neck dissection. A 37.5% five-year survival was accomplished in this series of patients by such an operative procedure. This has also been the experience at the Mayo Clinic as reported by Freeman et al.[2]

Adenocarcinomas and malignant mixed tumors present more difficult decisions as to optimal management. As previously noted, these tumors—particularly the adenoid cystic lesions—usually exhibit aggressive local growth tendencies. Metastasis to the cervical lymph nodes and distant metastases are, as a rule, associated with large primary tumors which are inoperable on the basis of local extension. An operation should be designed to obtain a wide local margin around the tumor and should include any structures within 2 -3 cm of it. In the series of cases in question, a parotidectomy with preservation of the facial

Malignant parotid tumor with associated facial nerve palsy.

nerve was performed in ten patients with relatively small tumors. A 60% five-year survival rate was obtained. A radical parotidectomy with excision of the facial nerve and also partial mandibulectomy, was performed in six additional patients with a 16% five-year survival rate. Ultimate survival appears to be primarily dependent upon the size of the tumor at the time of initial therapy. In the presence of a large primary tumor, an aggressive surgical approach seems indicated particularly with the adenoid cystic carcinomas. A

conservative parotidectomy with preservation of at least portions of the facial nerve seems reasonable in the management of the smaller tumors.

Mid- and low-grade muco-epidermoid carcinomas are managed by a parotidectomy without sacrifice of the facial nerve. If the nerve or one of its branches is adherent to the tumor, that portion of the nerve should be excised with the tumor. A radical neck dissection is almost never indicated. A 100% five-year survival rate was obtained in nine patients in this series by such an operative procedure. Three patients with mid- or low-grade muco-epidermoid carcinomas were subjected to a radical parotidectomy with excision of the facial nerve and an associated radical neck dissection. Two of these patients survived and neither of these patients had evidence of cervical lymph node metastases on histologic section. The only death in the mid- and low-grade muco-epidermoid group occurred in a patient who was subjected to a radical parotidectomy and radical neck dissection, but succumbed to liver metastasis.

If it is necessary to sacrifice the facial nerve, immediate reconstruction by nerve graft is indicated.[4] For this reason, the greater auricular nerve is preserved during the operative procedure in the event that a subsequent graft is necessary.

The clinical management outlined above is designed to subject only those patients with certain types of malignant parotid tumors to extremely radical operative procedures. It has been shown in this series, and in others,[1, 2, 3] that excellent survival rates can be obtained with certain types of malignant parotid tumors by operative procedures which do not result in severe cosmetic and functional deformities associated with excision of the facial nerve or a partial mandibulectomy.

HOME OFFICE — BOSTON, MASS.

A Key Site of Action of the Protoveratrine A in Salutensin

"The main function of the carotid sinus is regulation of the blood pressure...."[1]

The veratrum component of Salutensin acts here (and in the myocardium), initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2]

SCHWENK

This is a logical Blood Pressure Regulator

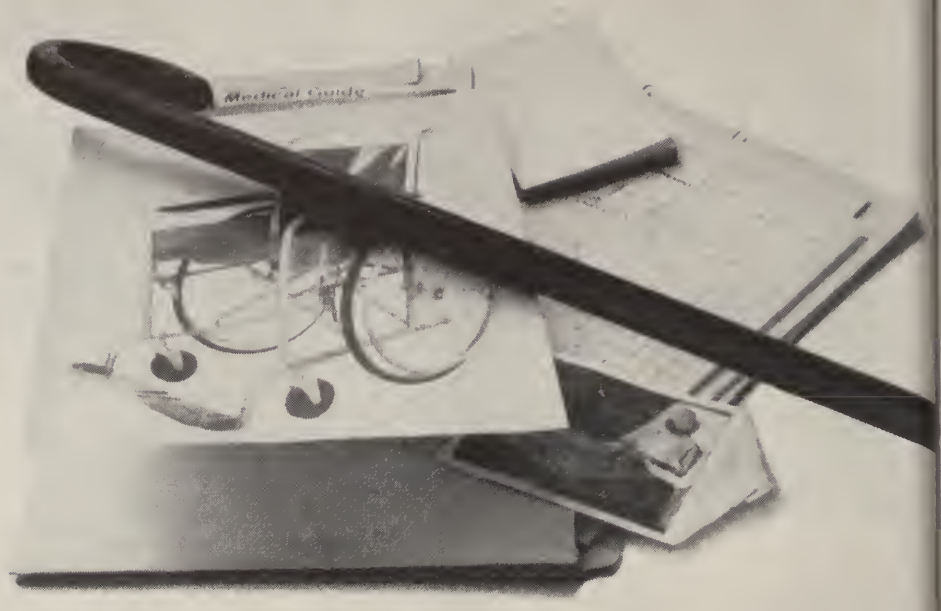
BECAUSE IT ENHANCES THE BODY'S OWN MECHANISMS FOR REDUCING BLOOD PRESSURE

In mild to moderate hypertension:

Salutensin enhances the body's own mechanisms for lowering blood pressure. The veratrum component of Salutensin acts on the carotid sinus and myocardial receptors, initiating "...a reflex fall in blood pressure through a generalized vasodilation and fall in heart rate."[2] To achieve this reflex modification of hypertension, Salutensin utilizes protoveratrine A. In addition, to facilitate and maintain blood pressure reduction, Salutensin incorporates reserpine and a highly effective thiazide. In general, side effects have been reported infrequently but may include those listed in the therapeutic summary.

Simple dosage—low-cost therapy: Many patients on Salutensin respond to 1 tablet *b.i.d.* Long-term economy is assured, since dosage can frequently be lowered after initial control is established.

Available: Prescription-size bottles of 60 tablets.



References: 1. Editorial: JAMA *191*:592 (Feb. 15) 1965. 2. Meilman, E., in Moyer, J.H.: Hypertension, Philadelphia, W.B. Saunders Company, 1959, p. 395.

BRISTOL THERAPEUTIC SUMMARY
For complete information consult Official Package Circular.
Indications: Essential hypertension.
Warnings: Small-bowel lesions (obstruction, hemorrhage, perforation) have occurred during therapy with enteric-coated formulations containing potassium, with or without thiazides. Such potassium formulations should be used with Salutensin only when indicated and should be discontinued immediately if abdominal pain, distention, nausea, vomiting or gastrointestinal bleeding occurs.
Contraindications: Salutensin is contraindicated in severe depression.
Precautions: Azotemia, hypochloremia, hyponatremia, hypochloremic alkalosis and hypokalemia (especially with hepatic cirrhosis and corticosteroid therapy) may occur, particularly with pre-existing vomiting and diarrhea. Potassium loss, which may cause digitalis intoxication, responds to potassium-rich foods, potassium chloride or, if necessary, stopping therapy. Serum ammonia elevation may precipitate coma in precomatose hepatic cirrhotics. Discontinue therapy two weeks before surgery or if myocardial irritability, progressive azotemia or severe depression occur. Exercise caution with patients with peptic ulcers or renal insufficiency (if severe, Salutensin is contraindicated).
Side Effects: Hydroflumethiazide: Purpura plus or minus thrombocytopenia, hyperuricemia, leukopenia, hyperglycemia, glycosuria, malaise, weakness, dizziness, fatigue, paresthesias, muscle cramps, skin rash, epigastric distress, vomiting, diarrhea and constipation. *Reserpine:* Depression, peptic ulceration, diarrhea, Parkinsonism, nasal stuffiness, dryness of the mouth and, with overdosage, agitation, insomnia and nightmares. *Protoveratrine A:* Nausea, vomiting, cardiac arrhythmia, prostration, excessive hypotension and bradycardia. (Treat bradycardia with atropine and hypotension with vasopressors.)
Usual Dose: 1 tablet *b.i.d.*

BRISTOL LABORATORIES
Division of Bristol-Myers Co.
Syracuse, New York

Salutensin®

Each tablet contains: protoveratrine A, 0.2 mg.; hydroflumethiazide, 50 mg.; reserpine, 0.125 mg.

in chronic illness

B and C vitamins are part of therapy: An imbalance of water-soluble vit
mins and chronic illness often go hand in hand. STRESSCAPS capsules, co
taining therapeutic quantities of vitamins B and C, are formulated to meet th
increased metabolic demands of patients with physiologic stress. In chronic i
ness, as with many stress conditions, STRESSCAPS vitamins are therapy.

Stresscaps®

Stress Formula Vitamins Lederle

FOR PROFESSIONAL RECOMMENDATION ONLY

Each capsule contains:

Vitamin B_1 (as Thiamine Mononitrate)	10 mg
Vitamin B_2 (Riboflavin)	10 mg
Vitamin B_6 (Pyridoxine HCl)	2 mg
Vitamin B_{12} Crystalline	4 mcgm
Vitamin C (Ascorbic Acid)	300 mg
Niacinamide	100 mg
Calcium Pantothenate	20 mg

Recommended intake: Adults, 1 capsule daily, for the treatment of vitamin deficiencies. Supplied in decorative "reminder" jars of 30 and 100; bottles of 500.

PRECEPTORSHIPS AND THE PRACTICE OF MEDICINE

GEORGE ENTWISLE, MD
Professor and Head, Department of Preventive Medicine and Rehabilitation
University of Maryland School of Medicine

Although preceptorships in general practice have been sponsored by medical schools for a number of years, there is little evidence that they have favorably affected medical students' interest in a career in general practice. Present influences on career choice are examined and a new program is suggested which might provide a more meaningful and rewarding experience for medical students, and relate directly to the future practice of medicine.

Concern for the shortage of general practitioners in Maryland has resulted in the formation of a special Governor's committee, some legislative hearings and, last year, even legislative action. In an attempt to remedy this shortage, the Governor's Commission to Study the Shortage of General Practitioners in the State of Maryland, and a legislative committee this year, have discussed the use of medical student preceptorships as a means of interesting medical students in a career in general practice. Implicit in the recommendation for the establishment of a preceptorship program in a medical school, particularly the University of Maryland School of Medicine, are two assumptions: (1) career choice of medical students can be influenced by the faculty or by elective and required undergraduate programs; and (2) experience in an elective or required preceptorship with a general practitioner will favorably influence career choice of medical students toward general practice. This paper will examine these assumptions and suggests an approach which might interest medical students in a career in family practice.

There is ample evidence that expressed career choice changes as the student proceeds through medical school and that far more medical students now express a career choice for specialty practice than did only a few years ago. On a number of occasions, the Association of American Medical Colleges has collected data on career choices from students at the time of graduation, or soon after graduation. The results of their studies indicate a rise in career choice for specialty practice from 63% in 1950 to 78% in 1961, and a decrease in career choice for general or family practice from 33% in 1950 to 18% in 1961.[1]

In the academic year 1962-1963, each student at our medical school was requested to provide information about his career interest. The career choices of the 352 students are shown in the Table. It will be noted that a large percentage of students begin medical school with an expressed career choice for some specialty or for a combination involving a specialty, and that the percentage increases over the four-year period. The

proportion of students choosing general practice, on the other hand, declines during the four years of medical school, and it is the specialty practice, research and teaching combination that absorbs the difference.

A decision for specialty practice is frequently made after graduation from medical school. In a study of trends in medical practice among medical school graduates from 1915 to 1950, Weiskotten reported that about 35% of the physicians who ultimately practiced a specialty decided upon this specialty in medical college and an additional 35% during the internship period.[2] About 25% made the decision during military service, during residency, or after a period of practice. The most recent survey of career choice of interns during the year 1964-1965, pointed out that 13% of 5,200 interns indicated reasonably definite intention to enter the field of general practice. Six years earlier, a survey of 2,600 interns indicated that 21% intended to enter general practice.[3]

Coker and others working at the University of North Carolina have inquired into factors that influence physicians in their choice of particular specialties or types of practice, and have made a number of reports.[4, 5, 6] Information was obtained from over 2,600 medical students at eight schools in a national sample, and the reports of these investigations clearly indicate that faculty members exert an influence on career choice.[4] One report in this series concerned specialization and general practice.[5] Among other differences, it was found that those medical students choosing general practice were more likely to be older, come from smaller towns, and have less financial resources.

The authors suggested that scholarships and loan funds would increase the number of physicians going into general practice. (In 1965 the Maryland Legislature approved funds for scholarships to medical students willing to commit themselves to a career in general practice in the State.)

Faculty Influence

The North Carolina studies of faculty influence on career choice of medical students clearly indicates such influence. Although these studies did not focus primarily on elective opportunities or summer fellowship work, it does seem likely that such experience contributes to this effect. Traineeships, fellowships, and other part-time work, supported largely from training grants or other restricted funds, are available for medical students in almost all medical specialties. Being aware of the lack of such opportunities in preventive medicine at the University of Maryland School of Medicine, and aware of Coker's report of the lack of influence of public health faculty members on career choice of medical students,[4] the Department of Preventive Medicine developed, some years ago, an undergraduate training program in epidemiology. This summer apprenticeship pro-

Career Choices of Students at University of Maryland School of Medicine

(1962-1963)

	All Students (N=352)	Freshmen (N=103)	Sophomores (N=99)	Juniors (N=78)	Seniors (N=72)
General Practice	24.1%	28.2%	29.3%	17.9%	18.1%
Specialty Practice	34.7	32.0	38.4	34.6	33.3
Specialty Practice/Research and Teaching	34.7	31.1	26.3	41.0	44.4
Research and Teaching	2.8	2.9	4.0	2.6	1.4
Other	1.7	1.9	1.0	2.6	1.4
No Response	2.0	3.9	1.0	1.3	1.4
TOTAL	100.0%	100.0%	100.0%	100.0%	100.0%

gram has been active for the last five years and has developed to the point where we can accept less than half the students who apply. Since this program has been available only a short period of time, no statement can be made about ultimate career choice for students who have participated in it, but we feel sure that a number of these current and former Fellows will make a career choice for preventive medicine, particularly academic preventive medicine.

Preceptorships

Although there is some information about influence of faculty and curricular programs on medical student career interest, the situation is less clear with respect to the influence of preceptorships on career choice for general practice. Preceptorships on either a required or an elective basis have been available at a number of medical schools for many years. A recent summary in the *Journal of the American Medical Association* indicated that 19 schools had established preceptorships in 1950.[7] By 1955, 25 schools offered preceptorships and almost 1,500 students participated on either a required or elective basis. In the year 1963-1964, 36 of the 87 medical schools reported some kind of preceptorship program. The program was required in 10 of the schools and elective in the remaining 26, and 979 students participated in the 26 programs during that year. Despite the increased number of available preceptorships, the total participating students has decreased over the 10-year period.

The opinions of faculty members on the value of such preceptorships vary significantly. At the First Institute on Clinical Teaching, sponsored by the Association of American Medical Colleges, opinions were obtained from deans and department heads on the value of preceptorships.[8] A preceptorship program was regarded as either harmful or of little or no value by 39% of 81 deans, and 37% of 391 department heads held a similar opinion. Sixty percent of the deans and 53% of the department heads thought that the preceptorship had some or much value. As might be expected, the opinions of the faculty members varied depending on whether their school did or did not have such a program. Forty-two percent of the participants at this conference who were from schools without a preceptorship program, felt that such a program was harmful (12%) or of little or no value (30%).

The Fifth Teaching Institute of the Association of American Medical Colleges, concerned with the ecology of the medical student, also touched on family care programs and preceptorships.[9] Excerpts from a number of letters published in the Institute report included comments that varied from "(the preceptorship program) is the most important single educational unit of their undergraduate years," to "until it has been demonstrated that extramural preceptorships can accomplish maintenance of high standards in teaching, I believe that any school that uses them must be considered to be providing its students with second-rate teaching, and that extramural preceptorships presently in existence should be abolished or reorganized."

Although the influence of preceptorship programs on career choice of medical students has not been completely evaluated, some information is available on the University of Wisconsin preceptorship program initiated over 25 years ago.[7] An evaluation of this program through the use of a questionnaire was completed in 1956 and indicated that the preceptorship program at Wisconsin had not influenced students to enter general practice.

Discussion

There seems to be little value, then, in replicating at our school, preceptorship programs tried at other schools. We might, however, consider the development of new programs or educational experiences which could influence the students' career choice for the practice of medicine in the future. Medical student education today should be considered in the light of the future because the average medical student has two more years of school, a year of internship, and a few additional years of postgraduate training. Most of the students will then spend two years in the armed services before starting their practice.

Predictions about the future practice of medicine, on which to base the development of a student program today, are clearly beset with difficulties. Many changes have occurred and are occurring in the complex social area of health care

in this country. In the last few years, hundreds of papers have been published in various medical journals concerned with changes and problems in health care. A number of these papers have focused on the future of general practice and some have been concerned with problems of organization of medical care, financing medical care, facilities and manpower, continuing education of physicians, administration and coordination of health services, and so forth. Discussion and studies in any of these areas can result in judgments and programs affecting the practice of medicine today and in the future. Opinions and suggestions concerning many of these problem areas vary just as widely as the comments quoted above about preceptorships. The development now of a special training program geared to the future practice of medicine would, of necessity, result from judgments based on incomplete information.

Probably the most important judgment concerns the personal physician: will he be needed and should we plan for his recruitment and training? In my opinion there is now, and will continue to be in the future, a significant portion of the population which wants to have, and should be provided with, the services of a personal physician, a physician who will provide continuity and coordination of medical care services for the patient and other members of his family. This portion of the population can be defined on the basis of age, the presence of certain illnesses or their probability of development, and other characteristics. We therefore need to plan for the recruitment and training of the future family-physician specialist.

We need to consider what programs or opportunities should be developed for medical students in order to acquaint them with, and interest them in, such a career. Clearly, the students should have an opportunity to observe, participate in, and learn from, a program of modern family-practice, and they should have an experience which is intellectually stimulating, exciting, and rewarding. I believe such a program can be developed with the efforts of medical school faculty and others. This program could have two components: (1) a family-practice clinic or service as an integral part of the medical school center and (2) an extramural program related to the practices of selected private practitioners.

The family-practice clinic at the medical school would be developed to provide ambulatory medical care to a few thousand families and it could be located either at or near the medical center. The families included in this program would be selected from patients who now seek their primary care from the outpatient department clinics and emergency room at the medical center—the financially indigent and the medically indigent. The changes in the Maryland Medical Care Program for these patients and the availability of special funds from the Childrens Bureau of the Public Health Service would facilitate the development of this special clinic. The program of health care made available would be the best family medicine that can be developed and would include continuity and coordination of care, health education, clinical preventive medicine and other services. It would be a place where the student could see practiced what many teachers recommend in terms of good medical care. It would be a more ideal setting for learning ambulatory medical care than the busy outpatient department specialty clinics where most medical students are now assigned. These clinics usually treat patients for episodes of illness with little evidence, to the student, of continuity and coordination of care.

I am confident that faculty members, with the assistance of other practitioners, can develop such a clinic, and that this experience for medical students would be stimulating, interesting, and rewarding. This clinic would also provide an opportunity to gather data from a specific number of families on prevalence of diseases, association of diseases in certain groups, the effects of different approaches and techniques in health care, and administration of health services to groups of patients; it would be, in other words, a clinic for research studies in medical care. Hopefully, the practicing physicians assisting the medical school in the development of this clinic would be those whose own private practices would later serve as bases for the extramural program. There are many advantages to this approach. The practicing physician's knowledge and experience from practice would be useful in determining the scope of services to be provided these patients, the staffing of the clinic, and the use of auxiliary

personnel. We would learn jointly about the use of multiphasic screening tests and other techniques of health care, as well as experimental procedures in the provision of medical care services. The practicing physicians would become more familiar with current teaching programs at the school, particularly as they affect this family-medicine clinic. They would also learn about teaching techniques and realistic learning objectives for the students' experience in this clinic and thereby become more effective teachers.

The practicing physicians would also participate with us in the development of a record-keeping system for the family-practice clinic, a system that could be adapted to the physician's own practice for medical care research studies in community practice. The development of community family-practice opportunities for the medical students would take place after the family-practice clinic at the medical center had provided ample opportunity for the identification of appropriate objectives of service, teaching and research which could be transposed to the physicians' private practice.

These plans would certainly result in changes in the physician's practice, not only because of the development of learning opportunities for students in community medicine, but also because of changes resulting from experience in the family-practice service at the medical center. Changes, in the physician's practice, particularly record-keeping, would let the practice serve as a community laboratory for comparative studies in medical care. To a certain extent the anticipated changes in the physician's private practice which would make it a more ideal setting for an educational experience in community medical care, will result in additional expenses. Since these changes also would be of benefit in the broad research area of medical care, it seems likely that most, if not all, additional expenses could be funded with monies obtained for research and demonstration purposes.

This extramural counterpart of the family-practice clinic would give the student an opportunity to be exposed to a community practice within an environment of active inquiry into medical problems and, in so doing, would certainly enhance the educational value of the program. The extramural phase of the program would also include private patients of a different social class from those identified with the University Hospital practice clinic and thus would be more representative of the "average" or future practice of the medical students.

The family-practice clinic could also be used as a residency training area for the future personal physician and for other future specialists. This post-graduate training activity would complement and enhance the undergraduate program. It could also assist in recruiting physicians for this specialty, provided adequate training stipends were available. Grant funds presently support graduate training in a number of clinical specialties and sub-specialties. These funds are made available to increase the number of clinicians, clinical investigators, and teachers in specific specialties, particularly those where there is recognized and national need for more trained individuals. The stipends available for some of these fellowships are quite handsome in comparison with residency stipends of other clinical programs and serve as an incentive for training in a particular specialty. For a number of years the University Hospital has had an approved training program in Physical Medicine and Rehabilitation which is supported by funds from the Vocational Rehabilitation Administration. The fellowship stipend of the "residents" supported by this grant has varied from $6,500 to $8,900 a year. Residents in General Preventive Medicine or Fellows in areas of public health and epidemiology have a fellowship stipend beginning at $6,000, plus a dependency allowance. The most recent data on appointments to approved residency programs indicate that only 58% of available positions in general preventive medicine are now filled, and that only 46% of residencies in physical medicine are now filled.[10] This proportion of filled appointments is similar to that of approved general practice residencies, only 49% of which are filled. Many individuals involved in residency training in both preventive medicine and physical medicine feel that a post-graduate program with the stipend levels available, particularly when associated with an effective and meaningful undergraduate program in these same areas, will do much to improve the shortage of trained individuals in these areas, and, within a short period of time, to increase

The "Socio-geographic" mystery

hy is one man's gastric ulcer nother man's duodenal?

Geographic variation in the *incidence* of peptic ulcer is a familiar fact. But the proclivity of certain *kinds* of ulcer for certain geographic areas is a recently recognized phenomenon.[1,2]

For example, in one particular Norwegian fishing village there is a tendency for patients to develop a gastric ulcer; anywhere else in Norway, ulcers are usually duodenal. Peruvians high in the Andes have more gastric ulcers than their compatriots in the lowlands. Why? Nobody knows.

Social variations, too. Even in the same aphic areas there are interesting variations. An Englishman's ulcer depends h social standing—professional men suffer with duodenal ulcers, while ngmen have more of the gastric variety. In southern India the pattern is ed. Here, duodenal ulcers are common among laborers and agricultural rs and rare among the upper classes.

restigators are exploring every possible theoretical avenue in their search e cause of peptic ulcer. Of all the factors implicated in ulcerogenesis, ne that is generally acknowledged to be of primary importance is hyper- ion of gastric acid.[3-8] Or, as one author states it: "The medical management ptic ulcer pharmacologically is, in the final analysis, concerned largely the effective inhibition of peptic activity."[3]

binul (glycopyrrolate) provides potent, rapid, specific antisecretory action med by gastric analyses and x-ray evidence of clinical effectiveness.[3,7,9-12] ves pain with "impressive" promptness.[8] Quickly alleviates acute discomfort, ffectively counteracts gnawing pain, preprandial midepigastric pain, ing and other ulcer symptoms.[7] Suppression of nocturnal pain is "out- ing."[13] Maximally effective doses may be given with minimal side ons, and the incidence of unwanted anticholinergic effects is negligible.[3,7-14]

matter what the ulcer theory... the fact is that

Robinul®

glycopyrrolate)

romotes the essential ulcer-healing environment

ROBINS

(brief summary follows)

R10A66

Robinul®
(glycopyrrolate)
promotes the essential ulcer-healing environment

Indications: In addition to its primary indications for duodenal and gastric ulcer, Robinul (glycopyrrolate) is indicated for other GI conditions that may benefit from anticholinergic therapy. Robinul-PH Forte (glycopyrrolate 2 mg. with phenobarbital) is indicated when these situations are complicated by mild anxiety and tension.
Contraindications: Glaucoma, urinary bladder neck obstruction, pyloric obstruction, stenosis with significant gastric retention, prostatic hypertrophy, duodenal obstruction, cardiospasm (megaesophagus), and achalasia of the esophagus, and in the case of Robinul-PH Forte, sensitivity to phenobarbital.
Precautions: Administer with caution in the presence of incipient glaucoma.
Adverse Reactions: Dryness of the mouth, blurred vision, urinary difficulties, and constipation are rarely troublesome and may generally be controlled by reduction of dosage. Other side effects associated with the use of anticholinergic drugs include tachycardia, palpitation, dilatation of the pupil, increased ocular tension, weakness, nausea, vomiting, headache, dizziness, drowsiness, and rash.
Dosage: Dosage should be adjusted according to individual patient response. Average and maximum recommended dose is 1 tablet 3 times a day: in the a.m., early p.m., and at bedtime. *See product literature for full prescribing information.*
Supply: Robinul (glycopyrrolate 1 mg.); Robinul Forte (glycopyrrolate 2 mg.); Robinul-PH (glycopyrrolate 1 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming); Robinul-PH Forte (glycopyrrolate 2 mg.) with phenobarbital 16.2 mg. (Warning: May be habit-forming.) In bottles of 100 and 500 scored tablets.

the proportion of residencies filled with well qualified trainees and Fellows. I feel that similar statements could be made about the future personal physician and his training.

Conclusions

This paper has reviewed briefly the changes in career choice of medical students, and the influence of faculty members and preceptorships on that choice. Clearly the number of students selecting a career in general practice has decreased over the years and preceptorships, as presently constituted, appear to be decreasing in popularity. Evidence has not yet been provided that they influence a career choice for general practice.

This paper outlines a proposal, for consideration and discussion, for the development of a family-practice clinic and related extramural private practice resources. The purpose of such a program is to provide students with opportunities for learning in the area of family and community medicine. This proposal is not complete and many more details need to be worked out. I am confident, however, that there are practicing physicians who would be willing to work with the faculty in the development and implementation of such a program and who would be willing to use their own private practices in this endeavor.

UP TO 10–12 HOURS' CLEAR BREATHING ON ONE TABLET

Dimetapp® Extentabs®

(Dimetane® [brompheniramine maleate], 12 mg.; phenylephrine HCl, 15 mg.; phenylpropanolamine HCl, 15 mg.)

sinusitis, colds, or U.R.I., imetapp lets congested patients reathe easy again. Each Extentab rings welcome relief all day or all night, sually without drowsiness or over-timulation. Its key to success? The limetapp formula—Dimetane (brom-heniramine maleate), a potent anti-istamine reported in one study to have licited side effects as few as the placebo,* eamed with decongestants phenyl-phrine and phenylpropanolamine—a dependable 10- to 12-hour form.

chiller, I. W., and Lowell, F. C.: New England Med. 261:478, 1959.

Contraindications: Patients hypersensitive to antihistamines. Not recommended for use during pregnancy.

Precautions: Until the patient's response has been determined, he should be cautioned against engaging in operations requiring alertness. Administer with care to patients with cardiac or peripheral vascular diseases or hypertension.

Side Effects: Hypersensitivity reactions including skin rashes, urticaria, hypotension and thrombocytopenia have been reported on rare occasions. Drowsiness, lassitude, nausea, giddiness, dryness of the mouth, mydriasis, increased irritability, or excitement may be encountered.

Dosage: 1 Extentab morning and evening, or as needed.

Supplied: Bottles of 100 and 500.

Also available: Dimetapp® Elixir for conventional *t.i.d.* or *q.i.d.* dosage. See package insert for further details.

RICHMOND, VIRGINIA 23220

A·H·ROBINS

Phenaphen® with Codeine

the only leading compound analgesic that calms instead of caffeinates

Each capsule contains:

Phenobarbital (¼ gr.) ..... 16.2 mg.
(Warning: may be habit forming)
Aspirin (2½ gr.) .....162.0 mg.
Phenacetin (3 gr.) .....194.0 mg.
Hyoscyamine sulfate .....0.031 mg.
Codeine phosphate.....¼ gr. (No. 2), ½ gr. (No. 3), 1 gr. (No. 4)
(Warning: may be habit forming)

Contraindications: Hypersensitivity to any ingredient.

Precautions: As with all phenacetin-containing products, avoid excessive or prolonged use.

Side Effects: Side effects are uncommon—nausea, constipation, and drowsiness have been reported.

A-H-ROBINS

A. H. ROBINS CO., INC., Richmond, Va. 23220

brings peace to the hyperactive colon

CANTIL®
(mepenzolate bromide)

helps restore normal motility and tone

"In 40 of 44 cases of irritable or spastic colon, Cantil [mepenzolate bromide] or Cantil with Phenobarbital reduced or abolished abdominal pain, diarrhea and distention and promoted restoration of normal bowel function . . . Cantil [mepenzolate bromide] proved to be singularly free of anticholinergic side-effects . . . Urinary retention, noted in two cases was eliminated in one by reducing dosage."[1]

IN BRIEF: One or two tablets three times a day and one or two at bedtime usually provide prompt relief. Cantil with Phenobarbital may be prescribed if sedation is required.

Dryness of the mouth or blurring of vision may occur but it is usually mild and transitory. Urinary retention is rare. Caution should be observed in prostatic hypertrophy—withhold in glaucoma. Cantil with Phenobarbital is contraindicated in patients sensitive to phenobarbital.

Supplied: CANTIL (mepenzolate bromide)—25 mg. per scored tablet. Bottles of 100 and 250. CANTIL with PHENOBARBITAL—containing in each scored tablet 16 mg. phenobarbital (warning: may be habit forming) and 25 mg. mepenzolate bromide. Bottles of 100 and 250.

LAKESIDE LABORATORIES, INC. Milwaukee, Wisconsin 53201

LAKESIDE

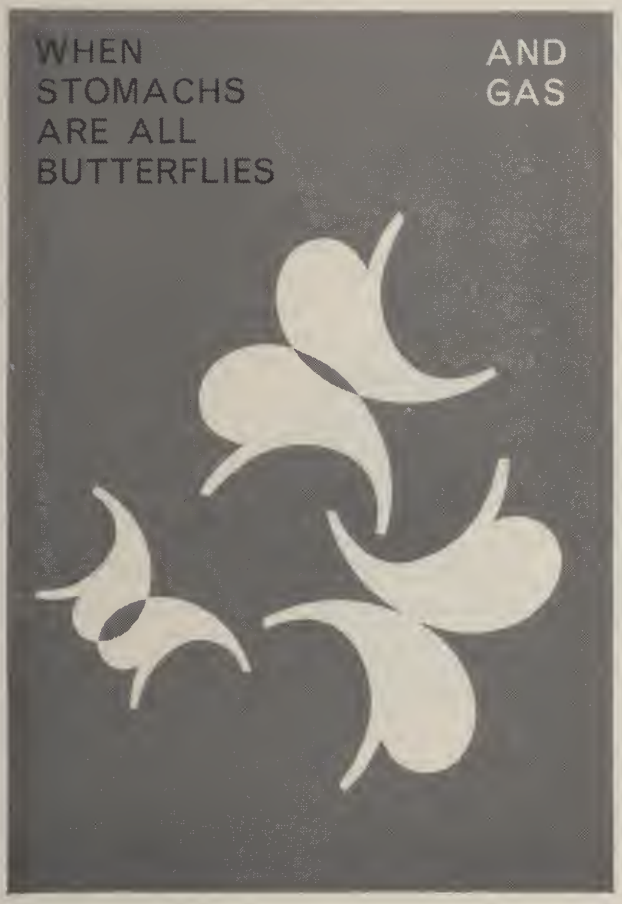
PRODUCTS
FOR PATIENTS
YOU SEE
EVERY DAY

Frankly, most antihypertensives are pretty good if you give an adequate dose. I'm looking for one with a simple regimen so that mix-ups in doses and therefore the chance of side effects are minimized.

Regroton®

chlorthalidone 50 mg. reserpine 0.25 mg.

1 tablet daily brings pressure down



Advantage: Both components of Regroton are long-acting.
Average dosage: One tablet daily with breakfast.
Contraindications: History of mental depression, hypersensitivity, and most cases of severe renal or hepatic diseases.
Warning: Discontinue 2 weeks before general anesthesia, 1 week before electroshock therapy, and if depression or peptic ulcer occurs. With administration of enteric-coated potassium supplements, the possibility of small bowel lesions should be kept in mind.
Precautions: Reduce dosage of concomitant antihypertensive agents by one-half. Discontinue if the BUN rises or liver dysfunction is aggravated. Electrolyte imbalance and potassium depletion may occur; take particular care in cirrhosis or severe ischemic heart disease, and in patients receiving corticosteroids, ACTH, or digitalis. Salt restriction is not recommended. Use with caution in patients with ulcerative colitis, gallstones, or bronchial asthma.
Side effects: Nausea, vomiting, diarrhea, muscle cramps, headaches and dizziness. Potential side effects include angina pectoris, anxiety, depression, drowsiness, hyperglycemia, hyperuricemia, lassitude, leukopenia, nasal stuffiness, nightmare, purpura, urticaria, and weakness.
For full details, see the complete prescribing information.
Availability: Bottles of 100 and 1000 tablets.

Geigy

DACTILASE®

Each tablet contains:
Dactil® (piperidolate hydrochloride), 50 mg.;
Standardized cellulolytic* enzyme, 2 mg.;
Standardized amylolytic enzyme, 15 mg.;
Standardized proteolytic enzyme, 10 mg.;
Pancreatin 3X** (source of lipolytic activity), 100 mg.; Taurocholic acid, 15 mg.

*Need in human nutrition not established.
**As acid resistant granules equivalent in activity to 300 mg. Pancreatin N.F.

In chronic or acute indigestion, fluttery, gassy stomachs obtain prompt, gratifying relief through the antispasmodic, surface anesthetic and enzymatic activity of Dactilase. Dactilase decreases hypermotility and pain and reduces the production of gas. Dactilase does not induce stasis, but helps restore normal tone. It has little or no effect on enzyme secretions, but *adds* enzymes, thus contributing to the digestive efficiency of the patient.

Side Effects and Contraindications: Dactilase is almost entirely free of side effects. However, it should be withheld in glaucoma and in jaundice due to complete biliary obstruction.

Administration and Dosage: One tablet with, or immediately following, each meal. Tablets should be swallowed whole.

Supplied: Bottles of 60 and 250.

CHANGING PATTERNS OF PSYCHIATRIC CARE IN MARYLAND

KURT GORWITZ, ScD
Director of Mental Health Statistics
State of Maryland Department of Mental Hygiene

Most of the improvements in the care of Maryland's mentally ill have occurred since the exposure of "Maryland's Shame" in a series of articles, under that title, published in 1949. Although statistics per se appear to justify feelings of satisfaction and complacency with regard to accomplishments in this field during the past 17 years, a closer look reveals many serious deficiencies. Meanwhile, responsibility for care of the mentally ill, once conceived as that of local municipalities, is evolving, in part, from the state to the federal government. Past improvements, present problems and anticipated developments in the future are enumerated here.

In most states the care of the mentally ill was the legal responsibility of the county or local municipality until the last decade of the 19th century. They generally met this requirement by confining their mentally ill in local jails and almshouses. The concept of state responsibility met with widespread scorn and derision from those who considered this a problem primarily of local concern. The concept of federal financial support for state mental health programs was incorporated in a bill adopted by Congress in 1854. In a message accompanying his veto, President Pierce stated that the alleviation of social problems was not a proper concern of the federal government. Federal support for mental health programs remained minimal until the passage of the National Mental Health Act in 1946.

In Maryland, the Allegany County-operated Sylvan Retreat in Cumberland, which dates back to this period, is still in use as a facility for the mentally ill. In its basement one can see the dreary dungeons in which "unruly patients" were kept. It requires little imagination to picture how these patients were maintained and the effects of this confinement.

One of the leading exponents of improved care for the mentally ill through the establishment and improvement of state-operated hospitals was Dorothea Dix. She came to Maryland in 1852 and addressed a joint session of the Legislature. Her carefully documented presentation led to the establishment of the Spring Grove State Hospital at its present Catonsville site. It had previously been called The Maryland Hospital and was located on the present grounds of the Johns Hopkins Hospital. Care of Maryland's mentally ill continued to be primarily a county responsibility, however, until the establishment of the State Commission of Lunacy in 1886. The present system of State hospitals dates from this point in time. The Com-

Presented at the American Psychiatric Association Regional Research Conference on Psychiatric Epidemiology and Mental Health Planning, Baltimore, April 21, 1966.

For cold hands and feet, nothing beats hot stoves—but they *are* awkward to carry around. Now Gerilid, in good-tasting take-along chewable tablets can provide rapid vasodilation of peripheral circulation, bringing real warmth to the extremities and decreasing sensitivity to sudden temperature change. Patients *like* Gerilid and *know* they are getting relief.

GERILID™

Each chewable tablet contains: nicotinic acid (niacin) 75 mg. and aminoacetic acid (glycine) 750 mg.

Administration and Dosage: One or two chewable tablets 3 times a day before meals. If flushing is objectionable, dosage may be lowered. However, tolerance to flushing usually develops without loss of efficacy in regard to vasodilation. The recommended dosage should not be exceeded.

Side effects: Occasional lightheadedness or transient itching which may disappear with continued use. There are no known contraindications; however, caution is advised when there is a concomitant administration of a coronary vasodilator.

Supplied: Packages of 50 chewable tablets.

Also available in liquid form as Geriliquid®, in bottles of 8 and 16 ounces.

EVERY DAY

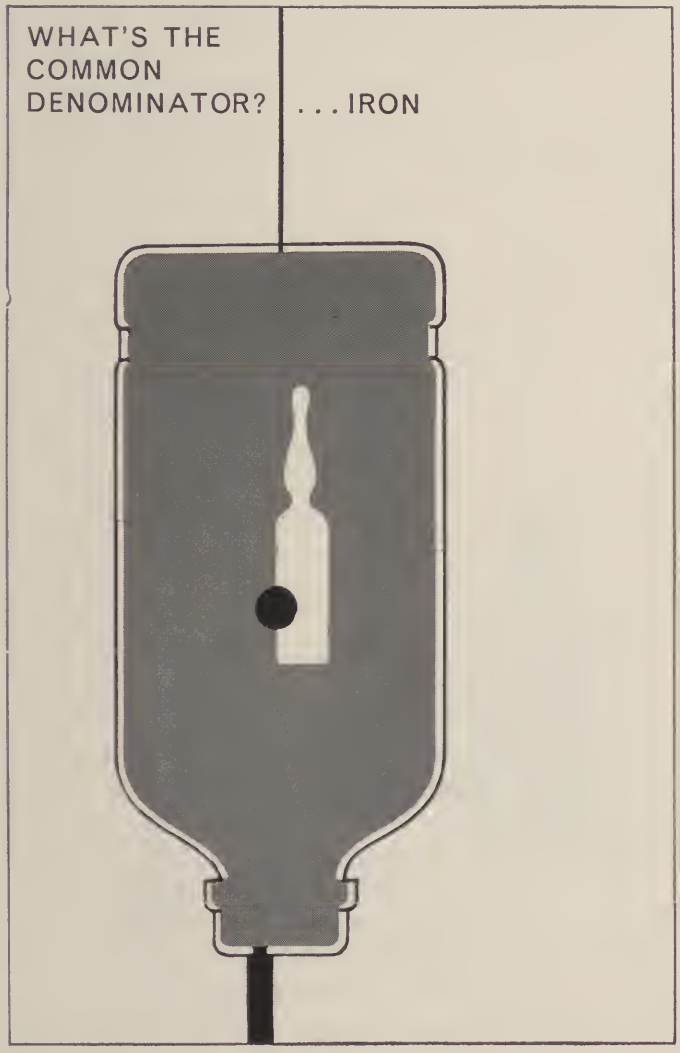
mission, from its inception, had supervisory powers over all public, corporate and private institutions in which insane persons were kept.[1] As part of its responsibility, the Commission developed a centralized patient-reporting system for all of these facilities which, 75 years later, was one of the factors related to the establishment of the Maryland Psychiatric Case Register.

This Commission (and the Board of Mental Hygiene which succeeded it) published annual reports from its inception until the establishment of the Department of Mental Hygiene in 1950. The reports indicate a program gradually improving because of the application of new psychiatric treatment concepts and modalities. This picture was fortified by a number of local grand jury reports which, although usually brief and superficial, were almost unanimously favorable. For example, it was reported after Worl War II that as many as 70% of admitted patients could ultimately be released as improved or cured. Based on 2,000 admissions annually, this figure would indicate that 600 or more patients per year became chronic while hospitalized.

In 1948 charges of serious deficiencies in the State mental hospital program came to the attention of the *Baltimore Evening Sun*. It assigned a reporter named Howard M. Norton to ascertain the facts. His report was published in a series of articles from January 9-19, 1949, under the headline "The Worst Story Ever Told By The Sunpapers." It became subsequently known as "Maryland's Shame."

The articles showed that only a small proportion of the patient population received available psychiatric services. Many patients were hospitalized for several years before being seen by a psychiatrist. Most received only custodial services, usually in overcrowded buildings of unsafe construction. Each of the hospitals was seriously understaffed and therefore sought to control disturbed patients by placing them in a variety of mechanical restraints. This practice had been discontinued as unnecessary and harmful to the patient in some English hospitals as far back as 1839.[2] Physical mistreatment of patients by the staff and by other patients was common. Mr. Norton charged that the hospitals were breeding chronic insanity faster than they cured it and were declining steadily toward the level of the 19th Century insane asylum where "the inmates raved and screamed their lives away out of sight and hearing of society." He pointed out that the many favorable reports published earlier were based on cursory examination by disinterested and uninformed citizens.

Maryland's Shame had its counterpart in many other states. It represented the end product of 20 or more years of accumulated neglect. Beginning with the depression in 1929, operating funds of mental hospitals were reduced to a minimum subsistence level. In the early days of the New Deal, $12 million in federal funds were available through the Public Works Administration, on a 50-50 matching basis, for mental hospital construction. Four-fifths of this money went to three states. Maryland, in company with most other states, did not participate because of its unwillingness or inability to provide the required matching funds. During World War II widespread personnel shortages caused further deterioration. The employment of conscientious objectors was not sufficient to halt this decline. Finally, slowly rising State support in the postwar period failed to keep pace with the increasing patient population.



Seventeen years have passed since Maryland's Shame roused officials and a concerned public to action. A great many changes have occurred during this time, some of them measurable. Among the most important of these are the following:

1. In 1949 statistics were limited to basic information on the flow of patients into, and out of, State-operated hospitals. Since 1961 the Maryland Psychiatric Case Register has been providing unique research data based on the longitudinally linked record of services received by 60,000 Maryland residents in more than 130 public and private inpatient and outpatient facilities.

2. Between 1949 and 1959 the State's expenditures for the operation of its mental hospitals tripled. They have doubled in the last seven years. The average expenditure per patient per day is now nearly five times as large as in 1949.

3. Until 1949 Maryland spent an average of $350,000 per year for capital construction in its mental hospitals. In the last 16 years, it has annually spent in excess of $2,500,000. The availability of additional facilities, together with a decline in the size of the patient population since 1955, reduced overcrowding in State hospitals

In fact, there's as much iron...250 mg. ...in a 5 cc. ampul of Imferon (iron dextran injection) as in a pint of whole blood. When iron deficient patients are intolerant of oral iron...or orally administered iron proves ineffective or impractical...or if the patient cannot be relied upon to take oral iron as prescribed, Imferon (iron dextran injection) dependably increases hemoglobin and rapidly replenishes iron reserves.

IMFERON®
(iron dextran injection)

IN BRIEF: ACTION AND USES: A single dose of Imferon (iron dextran injection) will measurably begin to raise hemoglobin and a complete course of therapy will effectively rebuild iron reserves. The drug is indicated only for specifically-diagnosed cases of iron deficiency anemia and then only when oral administration of iron is ineffective or impractical. Such iron deficiency may include: patients in the last trimester of pregnancy; patients with gastrointestinal disease or those recovering from gastrointestinal surgery; patients with chronic bleeding with continual and extensive iron losses not rapidly replenishable with oral iron; patients intolerant of blood transfusion *as a source of iron;* infants with hypochromic anemia; patients who cannot be relied upon to take oral iron.

COMPOSITION: Imferon (iron dextran injection) is a well-tolerated solution of iron dextran complex providing an equivalent of 50 mg. in each cc. The solution contains 0.9% sodium chloride and has a pH of 5.2-6.0. The 10 cc. vial contains 0.5% phenol as a preservative.

ADMINISTRATION AND DOSAGE: Dosage, based upon body weight and Gm. Hb/100 cc. of blood, ranges from 0.5 cc. in infants to 5.0 cc. in adults, daily, every other day, or weekly. Initial test doses are advisable. The total iron requirement for the individual patient is readily obtainable from the dosage chart in the package insert. Deep intramuscular injection in the upper outer quadrant of the buttock, using a Z-track technique, (with displacement of the skin laterally prior to injection), insures absorption and will help avoid staining of the skin. A 2-inch needle is recommended for the adult of average size.

SIDE EFFECTS: Local and systemic side effects are few. Staining of the skin may occur. Excessive dosage, beyond the calculated need, may cause hemosiderosis. Although allergic or anaphylatoid reactions are not common, occasional severe reactions have been observed, including three fatal reactions which may have been due to Imferon (iron dextran injection). Urticaria, arthralgia, lymphadenopathy, nausea, headache and fever have occasionally been reported.

PRECAUTIONS: If sensitivity to test doses is manifested, the drug should not be given. Imferon (iron dextran injection) must be administered by deep intramuscular injection only. Inject only in the upper outer quadrant of the buttock, not in the arm or other exposed area.

CONTRAINDICATIONS: Imferon (iron dextran injection) is contraindicated in patients sensitive to iron dextran complex. Since its use is intended for the treatment of iron deficiency anemia only it is contraindicated in other anemias.

CARCINOGENICITY POTENTIAL: Using relatively massive doses, Imferon (iron dextran injection) has been shown to produce sarcoma in rats, mice and rabbits and possibly in hamsters, but not in guinea pigs. The risk of carcinogenesis, if any in man, following recommended therapy with Imferon (iron dextran injection) appears to be extremely small.

SUPPLIED: 2 cc. ampuls, boxes of 10; 5 cc. ampuls, boxes of 4; 10 cc. multiple dose vials.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

from an estimated 50% in 1949 to 15% in 1965.

4. The number of professional and non-professional employees and their ratio to patients have greatly increased in the State hospitals. In 1949, there were 12 registered nurses, or one per 750 patients; now there are 140, or one for every 60 patients. The ratio of psychiatrists to patients has tripled in the last 10 years alone. For many patients, the attendant is the most frequent and important contact with the hospital staff. The ratio of attendants to patients has doubled since 1955. Similar changes have occurred in other categories.

5. The average patient population, which had increased steadily until it reached its peak in 1955, has now decreased almost to the level of 1949—even though admissions quadrupled from 2,000 to more than 8,000 between 1949 and 1965.

6. In 1949 it was reported that up to 70% of newly admitted patients could ultimately be released as improved or cured. Latest register data indicate that in excess of 90% of all admissions are released within two years. Among an increasing number of specific age and diagnostic cohorts, almost all are released within one year. For example, among psychotic patients aged 35-44, 54% were released within 3 months, 85% within 12 months, and 91% within 18 months. Among patients in this age group with psychoneurotic and personality disorders, 93% were released within one year.

7. Voluntary admissions, virtually non-existent in 1949, now account for 40% of all patients entering State hospitals. The court-committed, who a few years ago represented one-fifth of all admissions, now account for less than one out of every nine.

8. In 1949 the State mental hospital was the major treatment facility. Although statistics are not available for 1949 on the number under care in private or general hospitals, in outpatient facilities and in private practice, it is believed to have been a small proportion of the total patient load. By comparison, latest available Register data (for 1964) indicate that State mental hospitals now account for less than one-third of all admissions. The remainder include 51% to private hospitals, 7% to general hospitals, and 2% each to university-connected hospitals and to the VA hospital at Perry Point. The other 5% went to outpatient facilities. The year 1964 was actually the first in which a majority of reported psychiatric admissions were to community facilities. Patients seen in private psychiatric practice are not now reported to the Register and their number is therefore not known.

9. The State hospital's isolation from the community, a prominent feature in the days of Maryland's Shame, is increasingly becoming a fact of the past. The State has established or expanded its specialized programs in such areas as child psychiatry, forensic psychiatry, alcoholism, drug addiction and geriatrics. Programs in private hospitals, general hospitals and outpatient facilities, although in existence for many years, have increased in number, scope and variety. At the same time, new program concepts, such as day care centers, sheltered workshops and half-way houses, are becoming a reality. Comprehensive Community Mental Health Centers will soon be in existence in the Baltimore area and in other sections of Maryland. This plethora of facilities and services is changing the State hospital into one of the links in a chain designed to provide the mentally ill with a continuum of care. In addition to this, and related to it, there is growing recognition that we cannot be content with the treatment of the individual acutely ill patient: Our responsibility extends to intervention in the social situation in order to improve and promote mental health. If we ignore this, we will be eternally trying to go down an escalator which inexorably is going up.

10. Maryland, for the first time, has a comprehensive plan for meeting the future mental health needs of its population.

These basic facts are, I am sure, well-known. They readily lend themselves to a feeling of accomplishment and self-satisfaction. Lest we lapse into this state of euphoria, however, let us consider them in somewhat more detail:

1. Maryland's rising expenditures have barely kept pace with the general increase reported from all sections of the nation. Many of the more progressive states, such as Kansas, spend substantially more per patient per day than Maryland. Proportionally, expenditures at the Perry Point VA Hospital have continued to be twice as large as comparable figures for State-operated hospitals. Due to inflation, the 60¢ the state now spends to feed a patient per day is actually less than the

METAHYDRIN (trichlormethiazide) is prescribed by physicians because it not only approximates the diuretic efficacy of parenteral meralluride injection . . . but, *it is the least expensive of all "brand-name" thiazides*. Therefore, when you prescribe METAHYDRIN (trichlormethiazide) your patients receive the thiazide diuretic that removes a little more salt and water than earlier thiazides, with relatively less loss of potassium . . . and, it's therapy they can more easily afford . . . *only pennies a day*.

SAVES LIVES

SAVES MONEY

WASTES WATER

METAHYDRIN®

(trichlormethiazide)

oral diuretic

Dosage: One 2 or 4 mg. tablet once or twice daily.

Precautions: As with all effective diuretics, vigorous therapy may produce electrolyte depletion. Patients with severely reduced renal function should be observed carefully since thiazides may be contraindicated. Care should be taken with patients predisposed to diabetes or gout. Patients with a tendency to potassium deficiency, as in hepatic cirrhosis or diarrheal syndromes, or those under therapy with digitalis, ACTH, or certain adrenal steroids, also should be watched carefully.

Side Effects: Nausea, flushing, constipation, skin rash, muscle cramps and gastric discomfort have occasionally been noted; rarely thrombocytopenia and bone marrow depression, photosensitivity, cholestatic jaundice, pancreatitis, perimacular edema, gout and diabetes have been caused by the administration of thiazides.

Contraindications: Complete renal shutdown; rising azotemia or development of hyperkalemia or acidosis in severe renal disease; demonstrated hypersensitivity.

How Supplied: Bottles of 100 and 1000 tablets.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

46¢ spent in 1949. The expenditure for research and statistics by the state in 1966 accounts for less than one % of the Department's operating budget. Both continue to be financed primarily with federal funds.

2. It should be recognized that average figures can be very deceptive since they offer no indication as to the variation within the group. Where major variations exist, changes in the average may reflect internal changes in the group's composition. The Mental Hygiene Department's budget offers an example of this. One factor responsible for its increasing expenditures has been the four-fold increase in admissions and the six-fold increase in releases. This has produced a gradual rise in the number of beds occupied by short-term patients and a concomitant decline in the beds occupied by the chronically ill. In 1949 two-thirds of all beds were occupied by patients hospitalized continuously for five years or more; this proportion is now approximately one-half. In 1949 those hospitalized continuously for less than one year occupied less than 15% of hospital beds; they now occupy one-fourth. While accurate cost figures are not available, it is estimated that the cost per patient per day for the chronic versus the acutely ill is in the ratio of one to three or four. Another factor which also tends to distort longitudinal trends is the fact that the cost of the Department's pre- and post-hospital services and the operation of its reimbursements program, although not related to inpatient care, are now nevertheless included in hospital budget statistics.

3. The reduction in overcrowding from 50% to 15% between 1949 and 1965 has been accomplished mainly through an expenditure in excess of $40 million for hospital construction. Many of these newer buildings, however, exhibit the same features as older buildings—open wards with sleeping areas for 20 or more patients, together with bathroom facilities offering a minimum of personal privacy. It should be clear that this is not considered conducive to patient recovery and is at variance with the concept of a patient as an individual having certain basic, personal rights.

4. Statistics on employee-patient ratios do not necessarily present an accurate picture since they do not indicate the employee's function in the hospital structure. For example, 10 of the Department's 119 psychiatrists serve in its headquarters. An additional 23 in the hospitals have a primarily administrative responsibility such as superintendent, clinical director and director of education. Further, eight are primarily engaged in outpatient services. One-third are therefore not engaged in hospital patient treatment and only the remaining 78 should be counted in a psychiatrist-to-patient ratio. Thus, while the original figure of 119 is equivalent to one psychiatrist for every 70 patients, this ratio should be adjusted to one per 105. Further, this varies considerably between hospitals. At Springfield, Maryland's largest facility, it is one to nearly 200. A psychiatrist cannot, of course, adequately treat this large number of patients. The extensive use of tranquilizers since 1954 has now made the raving and screaming inmate described by Howard Norton in 1949 an uncommon sight. Nevertheless, employee shortages, although often obscured by available data, continue to make the custodial long-term patient receiving minimal treatment services a very common sight.

5. The large scale use of general hospitals for the treatment of mental illnesses has been mentioned by an earlier speaker. This is not the case in Maryland. Outside of the Psychiatric Institute here at University Hospital and the Phipps Psychiatric Institute at Johns Hopkins, psychiatric beds are still virtually nonexistent in Baltimore area general hospitals. In the rest of Maryland, only the Peninsula Hospital at Salisbury and the Prince George's Hospital at Cheverly now have such functioning units. The former does not, as yet, report to the Register. The latter reported 774 admissions in 1964. By comparison, most of the major Washington general hospitals have psychiatric departments. Although reporting from these facilities to the Register is not complete, available data indicate that they treated a minimum of 750 Maryland residents in 1964.

6. The number of patients treated in the private psychiatric hospitals has increased, due to shortened periods of hospitalization and greater turnover. These facilities now provide fewer beds, however, since a number, such as the Cedarcroft Sanitarium at Silver Spring, have ceased to exist. Register data indicate that their patient load is heavily concentrated among the white middle and upper middle class in the middle years of life admitted for the short term treatment of psy-

BRING IT DOWN
AND
KEEP IT DOWN

Metatensin lowers blood pressure and keeps it low—effectively and economically. It combines reserpine with trichlormethiazide which affords more potent saluresis with less loss of potassium than from earlier thiazides. Reserpine contributes antihypertensive effect by relieving anxiety and tension. Metatensin is well-tolerated over long periods; with its effectiveness and economy it assures antihypertensive therapy you and your patients can stay with.

METATENSIN®

Each scored tablet contains:
METAHYDRIN® (trichlormethiazide)
2 mg. or 4 mg. and
Reserpine 0.1 mg.

Usual adult dose: One tablet twice daily. **Precautions and side effects:** Patients with hepatic cirrhosis or diarrheal syndromes, or under therapy with digitalis, ACTH, or potassium-losing steroids, should be observed for signs of hypokalemia. With thiazides, electrolyte depletion, diabetes, gout, granulopenia, nausea, pancreatitis, cholestatic jaundice, flushing, mild muscle cramps, constipation, photosensitivity, acute myopia, perimacular edema, paresthesias, neonatal bone marrow depression in infants of mothers who received thiazides during pregnancy, skin rash or purpura with or without thrombocytopenia, may occur. With reserpine, untoward effects may include depression, peptic ulcer and bronchial asthma. Withdraw medication at least 7 days prior to electroshock therapy, 2 weeks prior to elective surgery.

Contraindications: Complete renal shutdown, rising azotemia or development of hyperkalemia or acidosis in severe renal disease.

Supplied: Metatensin tablets, 2 mg., 4 mg.—bottles of 100 and 1000.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE

PRODUCTS
FOR PATIENTS
YOU SEE
EVERY DAY

choneurotic and personality disorders. The alcoholic, the young, the old, the chronically ill are the exception. Even though segregation is not deliberately practised, the cost of treatment here effectively bars the Negro and other members of the lower economic classes from admission. Nine of Maryland's 11 privately operated psychiatric hospitals reported no non-white admissions to the Register during 1964. The remaining two had a total of 13. These accounted for less than 1% of the 1,422 admissions to these 11 facilities. By comparison, 27.4% of the 7,681 admissions to the six state operated psychiatric hospitals were non-white.

7. Register data indicate that outpatient facilities now care for the majority of all psychiatric admissions. These 80 community facilities in 1964 reported 12,868 admissions of 11,726 Maryland residents (the difference between these two figures reflects multiple admissions to the same or to different facilities). The majority of all outpatient admissions were under 25 years of age and 85% were less than 45 years of age. Only one percent were 65 years of age or older. Maryland now has outpatient facilities in Baltimore and in all except one of its 23 counties. Many of these are open for only a short period of time, usually on weekdays between 9:00 AM and 5:00 PM. They are in fixed locations and thus may be inaccessible to those who do not have means of transportation. The absence of evening or weekend clinic hours excludes many individuals who are employed and unable to take time off during regular working hours. Register data previously reported have shown that a majority of patients released from State hospitals on convalescent leave do not receive outpatient services.[3] Further, a paper recently presented by the Register staff showed that four out of five alcoholics admitted to three major state hospitals were not under any psychiatric care 18 months after admission and only three percent were receiving some type of outpatient service in a reporting facility.[4] Among psychotic patients, 76% had been released 18 months after admission. Of these, only 15% were under clinic care at that point. In the case of former hospital patients with psychoneurotic and personality disorders, 9% of the 89% who had been released were under outpatient care.

8. The rise in the number of alcoholic patients treated has been the most important factor in the rapid increase reported in admissions to the six State hospitals. In 1949 there were less than 300, or one out of every seven admissions. In 1965 there were more than 2,500 or more than one of every three. In 1949 alcoholics occupied 3% of the hospital beds; they now account for 6%. This increase may be attributed in part to changes in commitment laws and to the greater acceptance by the community, and by the alcoholic himself, of the State hospital as a treatment facility. Another factor related to this increase, however, is that alternatives to the State hospital continue to be virtually non-existent for the alcoholic. Register data indicate that alcoholics are rarely accepted for treatment in the private hospitals or in the psychiatric units of general hospitals. In comparison to the 2,500 who entered state hospitals, 126 alcoholics were admitted to private hospitals and 370 to general hospitals.

In Baltimore City there are only two clinics specifically for alcoholics (Psychiatric Institute and the Eastern Health District). Latest Register data show that they treated 427 patients at some time during a one year period. Only 5 of the 23 counties have clinics specifically for alcoholics. They reported a total of 285 patients under care during the latest one-year period. The State hospitals thus admitted twice as many patients for alcoholism as did all of these other facilities combined. For many alcoholics, a short hospitalization followed by extended community care is believed to be the best treatment method. That this is only infrequently employed has been shown earlier here. The number of alcoholics in Maryland's total population is not accurately known since an acceptable method for determining this figure has not yet been established, but it is estimated by the Department to be at least 70,000. This would indicate that only a small minority, probably in the neighborhood of 5%, are receiving any type of psychiatric services during any one year.

9. Register data indicate that 3,264 patients under the ages of 15 were admitted to psychiatric services in 1964. More than 90% of these went to outpatient facilities, with most of the remainder going to one of the State-operated hospitals. Data on children treated in outpatient facilities, particularly in the rural county-operated clinics, do not represent an accurate reflection of services provided since many of these patients are ad-

When depressed patients say:

"I can't sleep at night"

"I'm tired all day long"

NORPRAMIN®
(desipramine hydrochloride)
non-sedating · rapid-acting
ANTIDEPRESSANT

helps restore normal patterns of sleep and activity

Norpramin (desipramine hydrochloride) often reverses the signs and symptoms of depression including sleep disturbances feeling of sadness, guilt, anxiety, worthlessness and bodily complaints without physical basis. In 2-5 days most patients become more hopeful, active and less weighed down by their problems.

Norpramin (desipramine hydrochloride) has only slight sedative qualities, nevertheless sleep disturbances and restlessness are relieved as depression is lifted. If anxiety or tension develop or persist a tranquilizer may be added or dosage reduced. Side effects are usually mild, occurring in about 1 of 4 patients.

Indications: In moderate to severe depression—neurotic or psychotic. **Dosage:** Optimal results are obtained at a dosage of two 25 mg. tablets t.i.d. (150 mg./day). **Contraindications and Precautions:** Glaucoma, urethral or ureteral spasm, recent myocardial infarction, severe coronary heart disease and epilepsy. Should not be given within two weeks of an MAO inhibitor. Safety in human pregnancy has not been established. **Adverse Effects:** Usually mild, may include: dry mouth, constipation, dizziness, palpitation, delayed urination, "bad taste", sensory illusion, tinnitus, agitation and stimulation, sweating, drowsiness, headache, orthostatic hypotension, flushing, nausea, cramps, weakness, blurred vision and mydriasis, rash, allergy, transient eosinophilia, granulopenia, altered liver function, ataxia and extrapyramidal signs. **Supplied:** Norpramin (desipramine hydrochloride) tablets of 25 mg., in bottles of 50, 500 and 1000.

PRODUCTS FOR PATIENTS YOU SEE EVERY DAY LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

mitted for evaluation and diagnosis rather than treatment. Where treatment is provided, it is usually as part of a general mental health clinic program. The number of clinics for children has remained small. The State hospital continues to be the major inpatient treatment facility for children since private psychiatric hospitals and general hospitals do not usually accept them. In 1964 there were 141 State hospital admissions under 15 years of age compared with 31 to private hospitals and 29 to general hospitals. Although there are some specialized facilities, such as Linwood in Ellicott City, these can handle only a small proportion of the children requiring such care.

In the State hospital system the Institute for Children is the major center up to the age of 12. Until a recent change in policy, however, many children were admitted to the other State hospitals. A number of special units for the treatment of adolescents have been developed on the grounds of these facilities, but these, too, are small in number and inadequate to meet the need. Therefore the majority of adolescents continue to be treated in wards with other patients, a policy which is not believed to be conducive to the recovery either of the adolescent or of the adult.

One major difficulty here, as in other areas, is that Maryland suffers a chronic shortage of professional personnel. For example, data available from the American Psychiatric Association indicate that there are only six Board Certified Child Psychiatrists in Maryland, of whom three are in the Baltimore area. Maryland's population includes 725,000 residents between the ages of 5 and 14. The limitations indicated here reflect a continuous, growing problem with no immediate prospect for major relief. In 1966 it is Maryland's cause for shame.

10. The State hospitals also continue to be the major treatment facilities for the older person requiring services for mental conditions. Their reported 917 admissions of patients 65 years of age or older compare with 227 to private hospitals, 150 to general hospitals and 267 to outpatient facilities. Thus, nearly 60% of admissions in this age group were to the State hospitals. This group now occupies 2,500 beds. Most receive only minimal services. There has been a slight decrease in their number, due mainly to a mortality rate which exceeds 25% per year. Deaths in this group continue to exceed the number released.

This paper has concerned itself with changing patterns in psychiatric care in Maryland. It has been shown here that major improvements in services for the mentally ill have occurred, particularly in the 17 years since publication of "Maryland's Shame," but that deficiencies continue to exist in many areas. Some examples of these have been cited. It should be recognized that, for the child, the senior citizen, the alcoholic and many other groups, required specialized services continue to be available only on a minimal basis. For many of these it would be incorrect to speak of psychiatric care since this remains virtually nonexistent. It would therefore appear that the title of this paper should athe have been "Changing Patterns of Mental Health Services in Maryland."

The development of comprehensive mental health centers as a key part of a total program for meeting Maryland's mental health needs, offers a brighter future for psychiatric care. It should be noted in conclusion that the original concept of this plan, and most of its cost, came from the Federal Government. This is one indication of rapidly expanding national participation and involvement in state and local mental health programs. It is one of the major steps forward in the gradual evolution from the concept of the mentally ill as the sole concern of the county or local municipality.

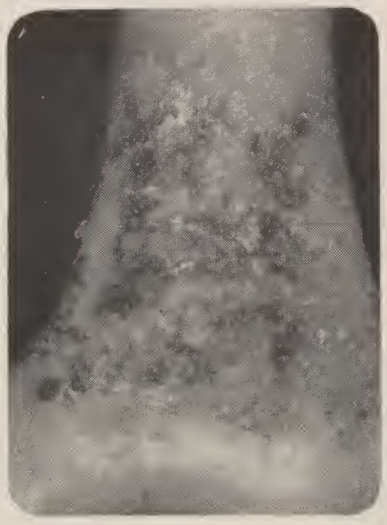
In colicky infants Pediatric Piptal with Phenobarbital slows down spasm, diminishes pain and crying and improves feeding patterns. It permits sleep and rest for patient and family. The less than hypnotic amount of phenobarbital in the recommended dose affords a mild, calming action and enhances the antispasmodic action of Piptal (pipenzolate bromide). The latter drug, as reported in the medical literature, has a favorable ratio of effectiveness to side-effects which is unusual in anticholinergics and thus is particularly appropriate to pediatric use.

PEDIATRIC PIPTAL® WITH PHENOBARBITAL



each cc. contains 6 mg. phenobarbital (warning: may be habit forming); 4 mg. Piptal® (pipenzolate bromide), and 20% alcohol.

Pleasant-tasting Pediatric Piptal with Phenobarbital is miscible in milk, formulas and fruit juices, and may also be given by dropper directly on the infant's tongue. Dosage is 0.5 cc. 15 minutes before feeding; in severe cases, 1.0 cc. four times daily. High doses may occasionally cause constipation with tenesmus and, rarely, flushing without fever. It is contraindicated in bowel obstruction or sensitivity to phenobarbital or anticholinergics. Available in 30 cc. dropper bottles, droppers calibrated to deliver 0.5 cc.

LAKESIDE LABORATORIES, INC., Milwaukee, Wisconsin 53201

LAKESIDE | PRODUCTS FOR PATIENTS YOU SEE EVERY DAY

Eczema of many years... controlled in two weeks

Before treatment

After treatment—
with ARISTOCORT Topical
Ointment 0.1% for two weeks

ARISTOCORT® Triamcinolone Acetonide Topicals have proved exceptionally effective in the control of various forms of eczema: allergic, atopic, nummular, psoriatic, and mycotic.

In most cases responsive to topical ARISTOCORT, the 0.1% concentration is sufficiently potent. The 0.5% concentration provides enhanced topical activity for patients requiring additional potency for proper relief.

Administration and Dosage: Apply sparingly to the affected area 3 or 4 times daily. Some cases of psoriasis may be more effectively treated if the 0.1% Cream or Ointment is applied under an occlusive dressing.

Contraindications: Tuberculosis of the skin, herpes simplex, chicken pox and vaccinia.

Precautions and Side Effects: Do not use in the eyes or in the ear (if drum is perforated). A few individuals react unfavorably under certain conditions. If side effects are encountered, the drug should be discontinued and appropriate measures taken. Use on infected areas should be attended with caution and observation, bearing in mind the potential spreading of infection and the advisability of discontinuing therapy and/or initiating antibacterial measures. Generalized dermatological conditions may require systemic corticosteroid therapy. Steroid therapy, although responsible for remissions of dermatoses, especially of allergic origin cannot be expected to prevent recurrence. The use over extensive body areas, with or without occlusive nonpermeable dressings, may result in systemic absorption. Appropriate precautions should be taken. When occlusive nonpermeable dressings are used, miliaria, folliculitis and pyodermas will sometimes develop. Localized atrophy and striae have been reported with the use of steroids by the occlusive technique. When occlusive nonpermeable dressings are used, the physician should be aware of the hazards of suffocation and flammability. The safety of use on pregnant patients has not been firmly established. Thus, do not use in large amounts or for long periods of time on pregnant patients.

Available in 5 Gm. and 15 Gm. tubes and ½ lb. jars.

"'Tranquilizer' is not a good word"[1]

THIS classification is psychologically too seductive, pharmacologically too unspecific, and in terms of results not infrequently untrue."[2]

What is a tranquilizer? According to the 24th Edition of Dorland's Medical Dictionary[3] a tranquilizer is "an agent which acts on the emotional state, quieting or calming the patient without affecting clarity of consciousness."

Defining a drug by its effects, however, can be misleading. The same effects by which the dictionary defines a tranquilizer have sometimes been seen after administration of a sedative — or, for that matter, a placebo.

Ambiguous though the term may be, it appears to be here to stay. The 1966 edition of the Physicians' Desk Reference[4] lists 42 tranquilizers indicated for treatment of anxiety and apprehensive states.

'Tranquilizers' have differences in action, differences in effect

Although all tranquilizers are intended to calm anxious patients there *are* differences in their actions — and in their effects. They have been divided into three categories — the rauwolfia group, the 'minor' tranquilizers, and the phenothiazines.[5]

Although the tranquilizing effect of rauwolfia has been known for centuries, its use as an antipsychotic agent in current practice has diminished.[5]

A 'minor' tranquilizer is often prescribed to achieve more than one effect. Thus, besides being tranquilizers some of these compounds may be muscle relaxants, antihistaminics with some calming action, anticholinergic sedatives, or antispasmodics.[5]

The phenothiazines are considered 'major' tranquilizers because they alter psychotic behavior.[1] This classification may have done them more harm than good because it implies that the phenothiazines should be reserved for the more severely disturbed. This is not necessarily true.

The phenothiazines — and the problem of sedation

One of the problems of prescribing phenothiazines for ambulatory patients has been the fear that excessive sedation will impair the patient's ability to function. This, however, is less of a problem with some of the phenothiazines.

"Clinically they may be differentiated primarily in terms of their potency and the extent of their sedative effect, which appear to be inversely proportional. That is, the least potent, the one which is used in highest dosage, chlorpromazine, is the most sedative, while the reverse holds true for fluphenazine."[6]

In a recent report on various studies conducted over several years evaluating 360 patients treated for anxiety and stress with seven phenothiazines, this inverse relationship of potency to sedation was confirmed.[7] Also under consideration was the degree to which the particular phenothiazines neutralized anxiety (the angolytic index). Interestingly enough there was, again, an inverse relationship. The most sedative of the phenothiazines appeared to be the least active in neutralizing anxiety. Fluphenazine, one of the least sedative, on the other hand, was found to be most effective in relieving anxiety.[7]

RELATIVE SEDATIVE AND ANGOLYTIC INDICES OF PRINCIPAL PHENOTHIAZINES*

DRUG	SEDATIVE INDEX	ANGOLYTIC INDEX	BASED ON STANDARD DOSE OF
Chlorpromazine	100	15	25 mgs.
Triflupromazine	100	15	25 mgs.
Thioridazine	90	17	25 mgs.
Perphenazine	15	25	4 mgs.
Carphenazine	25	25	25 mgs.
Trifluoperazine	3.3	95	2.0 mgs.
Fluphenazine	3.5	100	2.5 mgs.

*adapted from Sainz[7]

Prolixin is therapeutically effective without excessive sedation

When used as a 'tranquilizer' in general medical practice, in many patients Prolixin (Squibb Fluphenazine Hydrochloride) suppresses anxiety, but not normal activity. These two features are of particular importance to patients who must be able to live and work without their normal daily activities being restricted.

Because of its longer duration of action, Prolixin, in doses of as little as one to three milligrams in adults, generally taken once a day, is effective in maintaining many patients free of their symptoms of anxiety and tension.

Contraindications: Do not use with high doses of hypnotics or in patients with subcortical brain damage. Use with caution in patients with a history of convulsive disorders. Severe reactions may occur in patients with idiosyncrasy to other centrally-acting drugs, and severe hypotension may occur in patients with special medical disorders, e.g. mitral insufficiency and pheochromocytoma.

Precautions: Effects of atropine, anesthetics and C.N.S. depressants may be potentiated. Hypotension may occur in patients undergoing surgery. Do not use epinephrine for treatment of the hypotensive reactions which may appear in patients on phenothiazine therapy.

Side Effects: Extrapyramidal reactions, allergic skin reactions, the possibility of anaphylaxis, drowsiness, visual blurring, dizziness, insomnia, nausea, anorexia, salivation, edema, perspiration, dry mouth, abnormal lactation, polyuria, hypotension, and jaundice and biliary stasis may occur. Routine blood counts are recommended to determine possible blood dyscrasias; if symptoms of upper respiratory infection occur, discontinue drug and institute appropriate therapy.

Available: 1 mg. tablets. Bottles of 50 and 500.

For full prescribing information, see package insert.

PROLIXIN®
SQUIBB FLUPHENAZINE HYDROCHLORIDE

SQUIBB 'The Priceless Ingredient' of every product is the honor and integrity of its maker.

block end runs

LOMOTIL®

tablets/liquid

Each tablet and each 5 cc. of liquid contains:
diphenoxylate hydrochloride..... 2.5 mg.
(Warning: May be habit forming)
atropine sulfate .....0.025 mg.

tackles the problem of diarrhea directly

Effectiveness—Physiologic evidence indicates that Lomotil acts directly on the smooth muscle of the bowel to lower motility and control diarrhea. This action is unsurpassed in promptness and efficiency.

Convenience—Lomotil is available as small, easily carried, virtually tasteless tablets and as a pleasant, fruit-flavored liquid.

Versatility—The therapeutic efficiency, safety and convenience of Lomotil may be used to advantage alone or adjunctively in diarrhea associated with:

• Functional hypermotility • Acute infections • Malabsorption syndrome • Drug therapy • Gastroenteritis and colitis • Irritable bowel • Regional enteritis • Ileostomy • Ulcerative colitis • Food poisoning

For correct therapeutic effect
Rx correct therapeutic dosage

Dosage: The recommended initial daily dosages, given in divided doses until diarrhea is controlled, are:

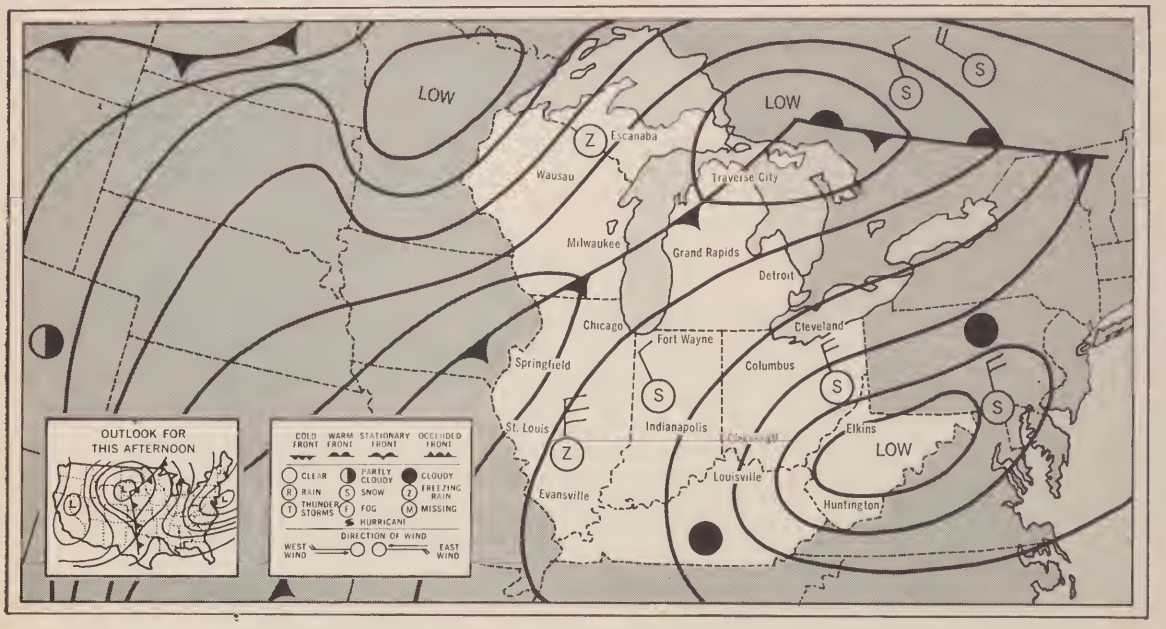
Children: Total Daily Dosage

3-6 mo. . . ½ tsp.* t.i.d. (3 mg.)
6-12 mo. . ½ tsp. q.i.d. (4 mg.)
1-2 yr. . . . ½ tsp. 5 times daily (5 mg.)
2-5 yr. . . . 1 tsp. t.i.d. (6 mg.)
5-8 yr. . . . 1 tsp. q.i.d. (8 mg.)
8-12 yr. . . 1 tsp. 5 times daily (10 mg.)

Adults: 2 tsp. 5 times daily (20 mg.)
(or 2 tablets q.i.d.)

*Based on 4 cc. per teaspoonful.

Maintenance dosage may be as low as one-fourth the initial daily dosage.



Precautions: Lomotil, brand of diphenoxylate hydrochloride with atropine sulfate, is a Federally exempt narcotic preparation of very low addictive potential. Lomotil should be kept out of reach of children since accidental overdosage may cause severe respiratory depression. Recommended dosages should not be exceeded. Lomotil should be used with caution in patients with impaired liver function and in patients taking addicting drugs or barbiturates. The subtherapeutic amount of atropine is added to discourage deliberate overdosage.

Side Effects: Side effects are relatively uncommon but among those reported are gastrointestinal irritation, sedation, dizziness, cutaneous manifestations, restlessness, insomnia, numbness of extremities, headache, blurring of vision, swelling of the gums, euphoria, depression and general malaise.

SEARLE *Research in the Service of Medicine*

REGIONAL WEATHER FORECAST

Severe Snow Storms, Strong Winds and Bitter Cold Followed by Cough, Stuffed and Runny Noses and Aches and Pains.

Tussagesic breaks up coughs, quickly clears stuffed and runny noses and relieves aches and pains. Provide coverage of the tough cold for up to 24 hours with just a single timed-release tablet dosed morning, midafternoon and at bedtime.

each

Tussagesic®

timed-release tablet contains:

Triaminic® (phenylpropanolamine hydrochloride 25 mg., pheniramine maleate 12.5 mg., pyrilamine maleate 12.5 mg.)	50 mg.
Dextromethorphan hydrobromide	30 mg.
Terpin hydrate	180 mg.
Acetaminophen	325 mg.

Dosage: Adults—1 tablet, swallowed whole to preserve timed-release feature, in morning, midafternoon and at bedtime. *Side effects:* Occasional drowsiness, blurred vision, cardiac palpitations, flushing, dizziness, nervousness or gastrointestinal upsets. *Precautions:* The patient should be advised not to drive a car or operate dangerous machinery if drowsiness occurs. Use with caution in patients with hypertension, heart disease, diabetes or thyrotoxicosis.

ACHALASIA: PRESENT CONCEPTS AND THE PRESENTATION OF THREE CASES

FAUSTO Q. AQUINO, JR., MD
Chief Resident in Medicine
St. Joseph Hospital

ARTHUR E. COCCO, MD
Director of Outpatient Department
St. Joseph Hospital
Instructor in Medicine
The Johns Hopkins University School of Medicine

Three cases of achalasia of the esophagus are presented. The present understanding of this entity and newer techniques in the methodology of diagnosis are reviewed. Surgical management and pneumatic dilatation are compared. It is suggested that esophagomyotomy be reserved for the small number of failures encountered after pneumatic dilatation, in the very young or where neoplasm can not be excluded.

Achalasia is a neuromuscular disorder characterized by failure of the terminal esophagus to relax during deglutition due to absent or ineffectual peristalsis throughout the body of the esophagus.[1, 2] It is frequently called cardiospasm, but present evidence favoring a motor defect in the body of the esophagus makes this occasionally used term obsolescent.

The first description of achalasia was that of Thomas Willis of Oxford. In 1672 he first treated the condition with a bougie consisting of a piece of whale bone on the end of which was tied a sponge.[3] Since his early report, recognition of the disorder as an entity has increased with the advent of newer diagnostic methodology. Its exact incidence is unknown, but it should not be thought of as rare in occurrence. Achalasia is nevertheless uncommon enough to present the practicing physician with many uncertainties with respect to its diagnosis and management. The purpose of this report is to review the present understanding of this disorder and the expected therapeutic result of treatment with the presentation of three cases.

Three Cases

Case No. 1

L. P., a 42-year-old white male, was admitted to the hospital because of progressive dysphagia and regurgitation of three months' duration. He had first experienced difficulty in swallowing solid food, which he indicated would stick in his chest at the level of the xiphisternum. He had relieved the dysphagia at an early stage by forcing the food past this point with liquid. From the time he first noted symptoms to the date of admission, he had lost 37 pounds.

Later in the course of the disease, he had vomited recognizable food after meals and, on some occasions, food he had ingested two or more days previously. When asked specifically, he stated that he had also noted secretions on his pillow in the morning which he had attributed to "slobbering" during his sleep. His physical examination was pertinent in that he showed obvious weight loss, and when an attempt was made to establish his "swallowing time," an esophageal squirt was not demonstrable.

His hematogram was normal. No blood was demonstrable in the stool. Routine blood chemistries were normal. The upper gastro-intestinal roentgenogram revealed marked dilatation of the body of the esophagus, with a smooth tapering constriction at the esophagogastric junction (Fig 1a). Esophageal motility studies revealed no progressive peristaltic contractions. Mecholyl (5 mg injected subcutaneously) initiated a marked elevation of the resting baseline intra-esophageal pressure with the simultaneous development of "spastic," non-progressive bursts of esophageal motor activity. Esophagoscopy demonstrated a markedly dilated esophagus, the distal end of which was closed, but could be traversed by manipulation of the esophagoscope. Endoscopic inspection of the cardio-esophageal junction was normal.

The patient was taken to the radiology department, and under fluoroscopic guidance, the Tucker-Hurst pneumatic dilator was placed at the esophagogastric junction. The bag was inflated to 15 pounds of pressure, which caused straightening of the concave distortion of the pneumatic bag present at the esophagogastric junction. The immediate post-dilatation period was uneventful, his dysphagia disappeared within twenty-four hours and (as of the date of preparation of the manuscript) he has remained asymptomatic for the ensuing nine months. Post-dilatation x-ray (Fig 1b) shows less dilatation after a barium swallow.

Fig 1a

Barium swallow picture, Case No. 1, before pneumatic dilatation

Fig 1b

Barium swallow picture, Case No. 1, after pneumatic dilatation

Case No. 2

A. W., a 47-year-old Negro female, was admitted to the hospital for vomiting and difficulty of swallowing. Symptoms dated back to three years prior to admission when she first noted sharp epigastric pain soon after each meal. It was

Fig 2a

Barium swallow picture, Case No. 2, before pneumatic dilatation

relieved by drinking liquid. Her difficulty progressed until pain occurred during the ingestion of solid food or liquid. It was relieved only by vomiting. Throughout the course of her illness she had a marked weight loss, but commented that her desire for food remained good. The patient learned by experience that if she ate slowly, chewed carefully and swallowed several times with each mouthful of food, she would have less discomfort. In addition, she noticed frothy materials and undigested food on her pillow upon awaking from sleep.

Physical examination and routine laboratory studies were entirely within normal limits. The upper gastrointestinal x-rays showed a markedly dilated esophagus, with an obstruction at the esophagogastric junction (Fig 2a).

The roentgenologist commented that no peristaltic activity was demonstrable in the body of the esophagus during fluoroscopy.

The esophageal motility test demonstrated a failure of the high pressure zone to relax with deglutition and showed that each swallow initiated a burst of simultaneous, nonprogressive contractions. The mecholyl test was markedly positive. The patient was esophagoscoped and no evidence of an obstructive lesion at the cardio-esophageal

Fig 2b

Barium swallow picture, Case No. 2, after pneumatic dilatation

junction was found.

The patient underwent pneumatic dilatation with the Tucker-Hurst dilator fluoroscopically placed and in gradually increased pressure until straightening of the cardio-esophageal junction was observed at 15 pounds of pressure. She experienced dramatic relief from her symptoms soon afterwards, and has gained 28 pounds in a period of six months. The post-dilatation barium swallow showed a less dilated esophagus (Fig 2b).

Case No. 3

A. N., a 78-year-old white female, was admitted to the hospital for fever, cough and chest pain on the right side of ten days' duration. Subsequent "work-up" revealed a right lower lobe pneumonitis. During her hospital course, it was noted by the nurses that the patient took extremely long periods to eat and had frequent paroxysms of cough during meals. When the patient was questioned specifically for symptoms related to swallowing, she denied difficulty of swallowing but reported increased "choking" during meals. Subsequent x-rays revealed marked dilation of her esophagus, with obstruction at the cardio-esophageal junction (Fig 3a). Marked "curling" of the esophagus was evident, as well as prominent "vallicular sign."

Esophagoscopy revealed dilation of the body of the esophagus, but the cardio-esophageal junction appeared normal. The patient was dilated with the pneumatic dilator in the usual manner. Subsequently she has been free of respiratory symptoms. The patient was not aware of swallowing difficulties before dilatation, but stated that eating and swallowing "felt so much easier" after the procedure. She has gained 27 pounds during the past fifteen months. The post-dilatation x-ray is shown in figure 3b.

Clinical Manifestations

The most prominent symptom presented by patients with achalasia is that of dysphagia. This, however, may be overshadowed on occasion by respiratory difficulty, overwhelming weight loss and cachexia. While dysphagia was prominent in Cases 1 and 2, the patient in Case 3 was not really cognizant of it until after she had undergone dilatation of her esophagus. This lack of awareness, not uncommonly encountered, is best explained by adaptive changes in the patient's eating habits which may ensue, ie, a preference for soft foods, slow eating, monotonous chewing, and liquid- or air-swallowing to force a bolus into the stomach.

As the obstruction becomes more severe, vomiting is seen to become a more prominent feature. This vomiting is characteristically peculiar in that it is not associated with nausea and the vomitus often contains recognizable food stuffs ingested during meals in either the immediate or the recent past. Since the material vomited has never been allowed to mix with gastric secretion, it does not contain hydrochloric acid[4] and it is not associated with pyrosis, or the usual burning acid taste. As retention within the megaesophagus increases, the patient finds he cannot lie flat because of "spilling over" of the constantly full esophagus. The latter accounts for soiling of the pillow observed in Cases 1 and 2, and nocturnal paroxysmal cough seen in Case 3.

Fig 3a

Barium swallow picture, Case No. 3, before pneumatic dilatation

The physical findings in patients with achalasia are not specific. The outstanding features include weight loss, associated signs of malnutrition and, usually, the inability of the examiner to elicit a swallowing time. In those patients in which aspiration is prominent, one will observe signs and symptoms referable to the associated respiratory involvement.

Roentgenologic Changes

The routine chest film in achalasia may show widening of the mediastinal shadow produced by the megaesophagus.[5, 6] This finding is occasionally mistaken for an aortic aneurysm[5] or mediastinal tumor.[6] The barium swallow of patients with achalasia is remarkable during the fluoroscopic examination in that an absence of progressive peristalsis is the rule. The barium will be seen to traverse the body of the esophagus, then to be delayed at the esophagogastric junction. This abnormality accounts for the ability of the malady to support a barium column, a prominent feature important in its roentgenologic recognition. It is therefore mandatory that these patients be studied in the upright position.[2] Roentgenologically, achalasia raises the differential diagnosis of benign vs malignant obstructive esophageal disease. Characteristically, the obstructive lesion in achalasia is one of a tapering "bird beak" appearance of the distal esophagus terminating at the gastric cardia, while that of neoplasm is an abrupt, shelf-like deformity. Achalasia may be associated with neoplasm, however, and therefore carcinoma must be considered in all instances.[7] Associated roentgenologic features of achalasia frequently include the absence of a gastric shadow, signs of aspiration, and occasionally the "vallicular sign."

Fig 3b

Barium swallow picture, Case No. 3, after pneumatic dilatation

Endoscopy

Esophagoscopy is helpful and necessary in the diagnosis and management of all cases of achalasia because of the ever looming possibility of other obstructive processes. Upon entering the esophagus, the endoscopist frequently encounters a dilated, cavernous structure, usually filled with retained secretions. As he proceeds with his examination, he is impressed with the relatively normal appearance of the esophageal mucosa. In the distal esophagus, it is usually observed that the dilated body of the esophagus tapers in a regular fashion to a closed esophagogastric junction. With careful manipulation, the endoscopist is able to enter the cardia of the stomach, and to look for features other than normal mucosal configuration. Should doubt arise as to the nature of the obstructive lesion, biopsy is necessary.

Pathophysiology

The microscopic features of this condition are associated with either a decrease or a complete absence of ganglionic cells from the myenteric nerve plexus.[8, 9] Whether these findings are on a congenital or degenerative basis has been the subject of much debate and is beyond the scope of this report. Pertinent to the understanding of the pathophysiological changes, however, is that this deficit is associated with the interruption of autonomic motor pathways allowing motor activity to occur in an erratic manner and accounts for the diagnostic response to mecholyl, a synthetic

parasympathomimetic drug. The latter response is in accord with Cannon's law, which stated that "a tissue deprived of its autonomic nerve supply is excessively sensitive to the chemical transmitter of the nerve impulse, and is held to be pharmocological evidence of partial or complete aganglionosis."[10]

Esophageal Motility

With the advent and refinement of manometric esophageal studies, much progress in the diagnosis of achalasia has come into being. Code et al,[11] in a study of one hundred patients with achalasia, showed that the essential abnormality was the absence of progressive peristalsis in the body of the esophagus, and a failure of relaxation at the cardioesophageal junction. In other words, deglutition was followed by normal criopharyngeal function; erratic, spastic, non-propulsive or no motor activity in the body of the esophagus; and a failure of relaxation or even contraction at the cardioesophageal junction.[12] A diagrammatic manometric record of a four-channel simultaneous recording obtained with water-filled catheters, five cm apart, is shown in Figure 4. In addition, the characteristic manometric response in achalasia to the subcutaneous injection of mecholyl in accord with the "law of Cannon" results in an elevation in the baseline pressure and the initiation of spastic activity (shown for comparison in Figure 4).[13]

Management

It is unfortunate that most reports of this condition are written either by physicians who tend to overstress dilatation and decry operative

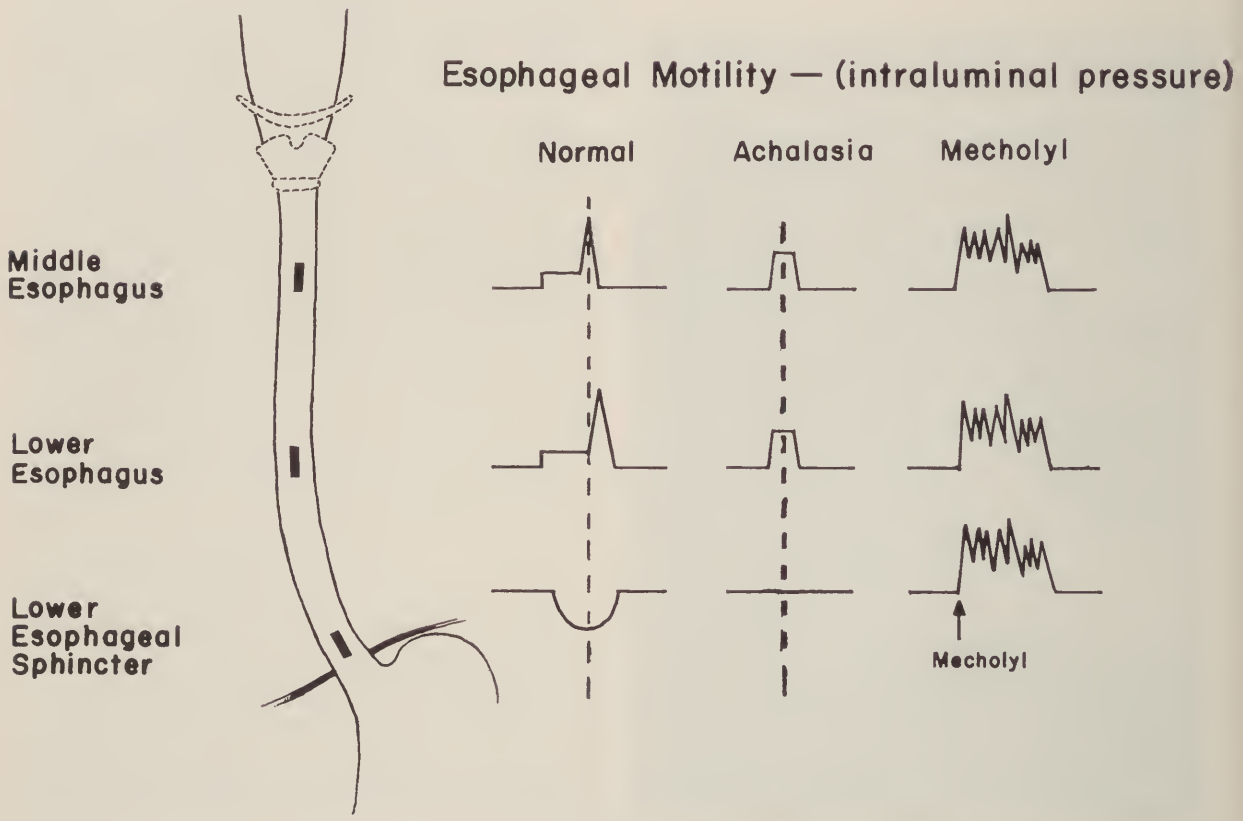

Fig 4

Esophageal motility comparing pressure changes occurring in the areas depicted at the left (1) in the normal, (2) in achalasia, and (3) in response to subcutaneous injection of mecholyl.

DO YOU HAVE A

treatment or by surgeons who report series treated by operation only and condemn the uncertain results of dilatation. The advantages of the expanding bag dilatation are that it can be carried out under local anesthesia with little discomfort to the patient and with great financial saving. Whenever the same result can be achieved by simple method with little risk and low morbidity, then such is, needless to say, to be advocated over the more complex method. This, however, may not always be possible, especially when the disease is encountered in the very young or in instances when malignancy is strongly suspected.

The results of expanding bag dilation vs surgical procedures are not statistically different, as indicated by Schindler,[14] who claimed 95% good result with a series of 84 patients by medical management, or Olsen et al,[15] who reported 100% excellent and immediate results in 57 patients treated surgically. The follow-up period of these patients, which extends from six months to six years, with a mean of two years, gave a 94% excellent result. These findings can be compared with the report by Payne, Ellis and Olsen,[16] who in 1960 claimed an excellent or good result in approximately 80% of patients treated with esophagomyotomy. It is significant that Steicher, Heller (originator of Heller's procedure) and Ravitch wrote in 1960 that "through the years most authors have agreed and still agree that approximately 70% to 80% of all patients with achalasia can be cured by one or several dilatations."[17]

Long term follow-up showing the efficacy of pneumatic dilatation is reflected in the report of Kurlander et al,[1] who reported that in 84% of 62 patients, a continuous asymptomatic state existed for 30 years after dilatation. Surgical procedures such as the esophagomyotomy (Heller's procedure) should, therefore, be reserved for the small number of failures encountered after pneumatic dilatations have been attempted.

History of the Baltimore City Hospitals

BY DOUGLAS CARROLL, M.D.

Chapter 12.—Some Problems of the Future

"The future confronts us with multiple uncertainties. The only assured facts are that circumstances and their issue have changed and that the what and the ways of time past are no longer entirely adequate, effective or rewarding."[1]

Perhaps the outstanding purpose of the Baltimore City Hospitals throughout its 200 years has been to meet community health and welfare needs not being met by other public and private organizations within the city. Initially, it was the depository for vagrants, prisoners awaiting trial, the elderly and infirm, foundlings, and the insane. As Baltimore developed, many of these functions were taken over by other organizations, mainly State supported institutions. It is logical to assume that the Baltimore City Hospitals will continue to respond to those needs of the community which cannot otherwise be met.

The hospital has been particularly fortunate in being able to develop an administrative organization which is sensitive to the needs of (1) the community and the medical profession, for the provision of medical care, (2) the medical schools, for teaching, and (3) the Department of Public Welfare, for care of the indigent, and, at the same time, to be sufficiently independent and free to meet existing and potential problems in its own way. This freedom is formalized in several basic and documented rules by which the future development of the hospital will be guided:

1. Visiting and staff physicians must have University Medical School appointments

The purpose of this rule is to assure the care of Baltimore City Hospitals, patients, and the teaching of house staff and students, by the foremost physicians of Baltimore. Although medical school staffs had been involved in the care of patients throughout the hospital's existence (since 1790), this required that *all* members of the visiting staff have appointments at the medical schools. Originated by Alan M. Chesney, MD, the rule was documented at a meeting of the Medical Advisory Board on April 7, 1934: ". . . provision (is to) be made for the appointment of a Junior Visiting Staff, the members of which will be responsible to their respective chiefs of services for the care of the patients who are assigned to them. The members of this staff should be recruited from the faculties of the two schools of medicine in as nearly equal proportions as the circumstances will permit."

2. Appointments of chiefs of service are to be the Joint Responsibility of the two Medical Schools and the Baltimore City Hospitals.

This agreement was worked out in 1961 after a good deal of acrimony between and among the Board of Estimates of the City of Baltimore, the Staff Conference Committee of the Baltimore City Hospitals, and the Medical Schools. It is a unique agreement between a Municipal Hospital and Medical Schools. It recognizes, on the one

hand, the hospital's right and responsibility to participate in the selection of Chiefs of Service (to fulfill patient care responsibilities) and, on the other, the right of the Medical Schools to have priority on certain services for student teaching (to assure continuity and planning of teaching).

Baltimore City Hospitals—Medical Schools Agreement, Dec 5, 1961

"In recent years there has been a country-wide trend towards close arrangements between City or County Hospitals and Medical Schools in the same community. This has proved to be productive of higher standards of medical care to the mutual advantage of the medical schools, the hospitals, and the community.

"The Department of Public Welfare of Baltimore City, and the staff of the Baltimore City Hospitals, are firmly convinced that their primary aim of providing the best possible medical care to their patients will be best served by strong medical school ties. The quality—and number—of the house officers and staff physicians who can be recruited to care for patients at the Baltimore City Hospitals will depend, to a considerable extent, upon association with the medical schools. The advantages to the city of close medical school associations stem essentially from the increased opportunity for staffing Baltimore City Hospitals with the most capable physicians at all levels,—with the obvious resultant benefits.

"The Baltimore City Hospitals is not, and is not likely to become, of a size such as to make it feasible, or advisable, to divide each of the services between the two medical schools in Baltimore.

"Baltimore City Hospitals reaffirms its intent to provide teaching opportunities to medical students from both the University of Maryland School of Medicine and the Johns Hopkins University School of Medicine. Equal opportunities for students from both schools will be offered on all services, within the limits of the needs of the two schools and the potentialities of the respective services.

"Along with these undergraduate teaching responsibilities and duties which are the proper concern of the two medical schools, the Baltimore City Hospitals has comparable responsibilities and duties in the post-graduate training and teaching of its house officers. For this training and teaching, neither medical school can assume full responsibility. The over-all teaching program at the Baltimore City Hospitals has evolved in such a way that the needs of students and house officers have been met by close integration within

"We go about our work, I hope and I believe, as quietly, as sturdily, and as sensitively as we know how, giving our diuretics, our antibiotics, our tranquilizers; without shrinking, without apologizing, and without insisting on sifting out definitively the moral and ethical aspects of the patient's illness beforehand, when our job is to care for him."[8]

John O. Neustadt, MD
(1916-1964)

Tank company commander, college dean and teacher, journalist, physician. BA, MA, St. John's College, Annapolis (1939 and 1942); Captain in Armor, AUS (1942-1946); MD, Johns Hopkins University School of Medicine (1952); assistant resident in medicine, Baltimore City Hospitals (1953-1954); first full-time chief of psychiatry, Baltimore City Hospitals (1961-1963).

the services. In addition, joint teaching and clinical sessions are held by several services. This inter-service cooperation has made it possible to develop mixed internship and residency programs designed to provide family practitioners for the community as well as specialists.

"All members of the professional staff of the Baltimore City Hospitals will continue to be required to hold faculty appointment in one of the two medical schools.

"Members of the house staff of the Baltimore City Hospitals will be eligible for consideration for appointment as Fellows in the University of Maryland School of Medicine and the Johns Hopkins University School of Medicine.

"The agreement which follows is designed to provide proper teaching facilities for the medical students of the two medical schools and to insure the continued availability of the Baltimore City Hospitals as an institution for the hospital care of the sick of the community and for the training of physicians in the practice of medicine:

AGREEMENT

"To assure continuity, direction and supervision of student teaching programs, each medical school will have priority on designated services. Such teaching priority will not be interpreted as excluding students from the other school from participating in the teaching activities of the service.

Student Teaching Priority Assignments

University of Maryland	Johns Hopkins University
Anesthesiology	Medicine
Obstetrics & Gynecology	Pathology
Radiology	Pediatrics
	Psychiatry

"The Johns Hopkins University School of Medicine will continue to have teaching priority on the surgical service during the tenure of the present Chief of Service. The University of Maryland School of Medicine will then have the option of assuming teaching priority on this service. Integration of functions among the services is of paramount importance. Inter-service coordination necessitates consideration of the effect of a change in any priority assignment on priorities on all services.

"Vacancies in the position of Chief of Service will be filled in accordance with the following procedure:

(1) A Chief of Service will be nominated by a committee on which there will be equal representation from the University of Maryland School of Medicine, the Johns Hopkins University School of Medicine, and the Baltimore City Hospitals.

(2) The committee member from the University of Maryland School of Medicine and the Johns Hopkins University School of Medicine will be designated by the respective schools. The committee member from the Baltimore City Hospitals will be a Chief of Service and will be appointed by the Chairman of the Medical Advisory Board. Each of these committee members shall have the right to vote.

(3) The representative of the medical school with priority will be chairman of the committee. The Director of Baltimore City Hospitals will serve as secretary of the committee but will not have the right to vote.

(4) Nominations will be unanimous. Each member of the committee with the right to vote shall have the power to veto. Nominations so made will be subject to the approval of the governing bodies of the faculties of the two medical schools to ensure the faculty status of the nominee at one or both medical schools and transmitted subsequently to the Medical Advisory Board of the Baltimore City Hospitals for its action.

(5) Upon approval of the Medical Advisory Board of the Baltimore City Hospitals, the nomination will be transmitted to the Advisory Board of the Department of Public Welfare for its action.

"Arrangements for salary supplementation by the medical schools in each instance will be negotiated between the candidate chosen and the medical schools in accordance with the stipulations of the Board of Estimates.

"This statement of policy shall continue in force until terminated or modified by mutual agreement, or it may be terminated at the election of any of the parties at the expiration of twelve months from the date of service of a written notice by one of the parties, stating a desire to terminate same."

3. The Hospital has Separate Status

In November, 1965, by vote of the people of Baltimore, the Baltimore City Hospitals was separated from its long association with the Baltimore City Department of Welfare and given separate status as the Department of Hospitals. The Hospital had prospered under the Department of Welfare and the separation was based more on the increasing size and importance of the Hospital than on any difficulty under the Department of Welfare.

Department of Hospitals

49. DEPARTMENT OF HOSPITALS—Organization and Powers:

(a) There shall be a Department of Hospitals, the head of which shall be the City Hospitals Commission whose membership shall include six appointed citizens who shall be informed as to the problems of hospital operation and the methods of hospital care, but who shall not be members of the medical or dental professions. They shall be appointed by the Mayor in the manner prescribed in Section 6 of Article IV and shall hold office as therein provided, except that they shall be appointed for terms of six years, two of them to expire at the end of every two years; provided that the first members shall be appointed to terms, two of which shall expire at the end of the first calendar year following the

calendar year in which the appointments are made, two of which shall expire at the end of the third calendar year following the calendar year in which the appointments are made, and two of which shall expire at the end of the fifth calendar year following the calendar year in which the appointments are made. In addition to those appointed, the Director of Welfare shall be a member of the Commission ex officio. The members of the Commission shall serve without compensation. The Mayor shall designate one appointed member of the Commission as its Chairman and may, from time to time, withdraw such designation and designate some other appointed member as Chairman of the Commission.

(b) The City Hospitals Commission shall be responsible for the organization and policy of the City Hospitals and shall make and put into effect such plans and procedures as in its judgment may be necessary or advisable to carry out the responsibilities of the City Hospitals, including the hospitalization and treatment of ill or injured persons, the carrying on of medical and health research, and the education of health personnel.

(c) The Department of Hospitals shall have a Director who shall be appointed by the Mayor in the manner prescribed by Section 6 of Article IV and shall hold office as therein provided, except that his term of office shall be for six years and his appointment shall be made upon the advice and prior approval of the City Hospitals Commission; provided, that, in the first instance, the person holding the position of Director of City Hospitals in the Department of Welfare shall become the Director of Hospitals on the applicable effective date as determined under Article IX and shall serve in accordance with the provisions of the Charter relating to the Classified Civil Service. The Director shall be responsible for the proper conduct and operation of the Department and shall appoint such assistants, aides and employees as may be provided in the Ordinance of Estimates; provided, however, that the assistant directors, department heads, chiefs of services, and heads of any institution managed by the Department must first be approved by the City Hospitals Commission.

Questions for the Future

History teaches us that the formulae of the past are not adequate for the future; not only do the methods of meeting problems change, but the questions requiring answers are different. Following are some questions about the future which can be expected to arise in relation to the Baltimore City Hospitals. These questions have to do with potential financial and personnel resources available to hospitals of the future, with attitudes toward, and goals of, medical care, and with the methods of carrying out these goals.[2]

1. Who will decide patient needs?

At the present time, the purely medical needs of patients for diagnosis and treatment of acute

"It is imperative that the training of our young doctors should, by high example, include exposure to the fact that compassion and intellectualism can be combined without loss of scientific excellence. It is also imperative that our system for the provision of medical care be so organized that the atrocities of medical neglect no longer occur. In this day of the somewhat tarnished image of the American physician, the modern deputies must speak out to end the unnecessary suffering of many of the chronically ill and aging and their anguished families. Is this a vain hope?"[9]

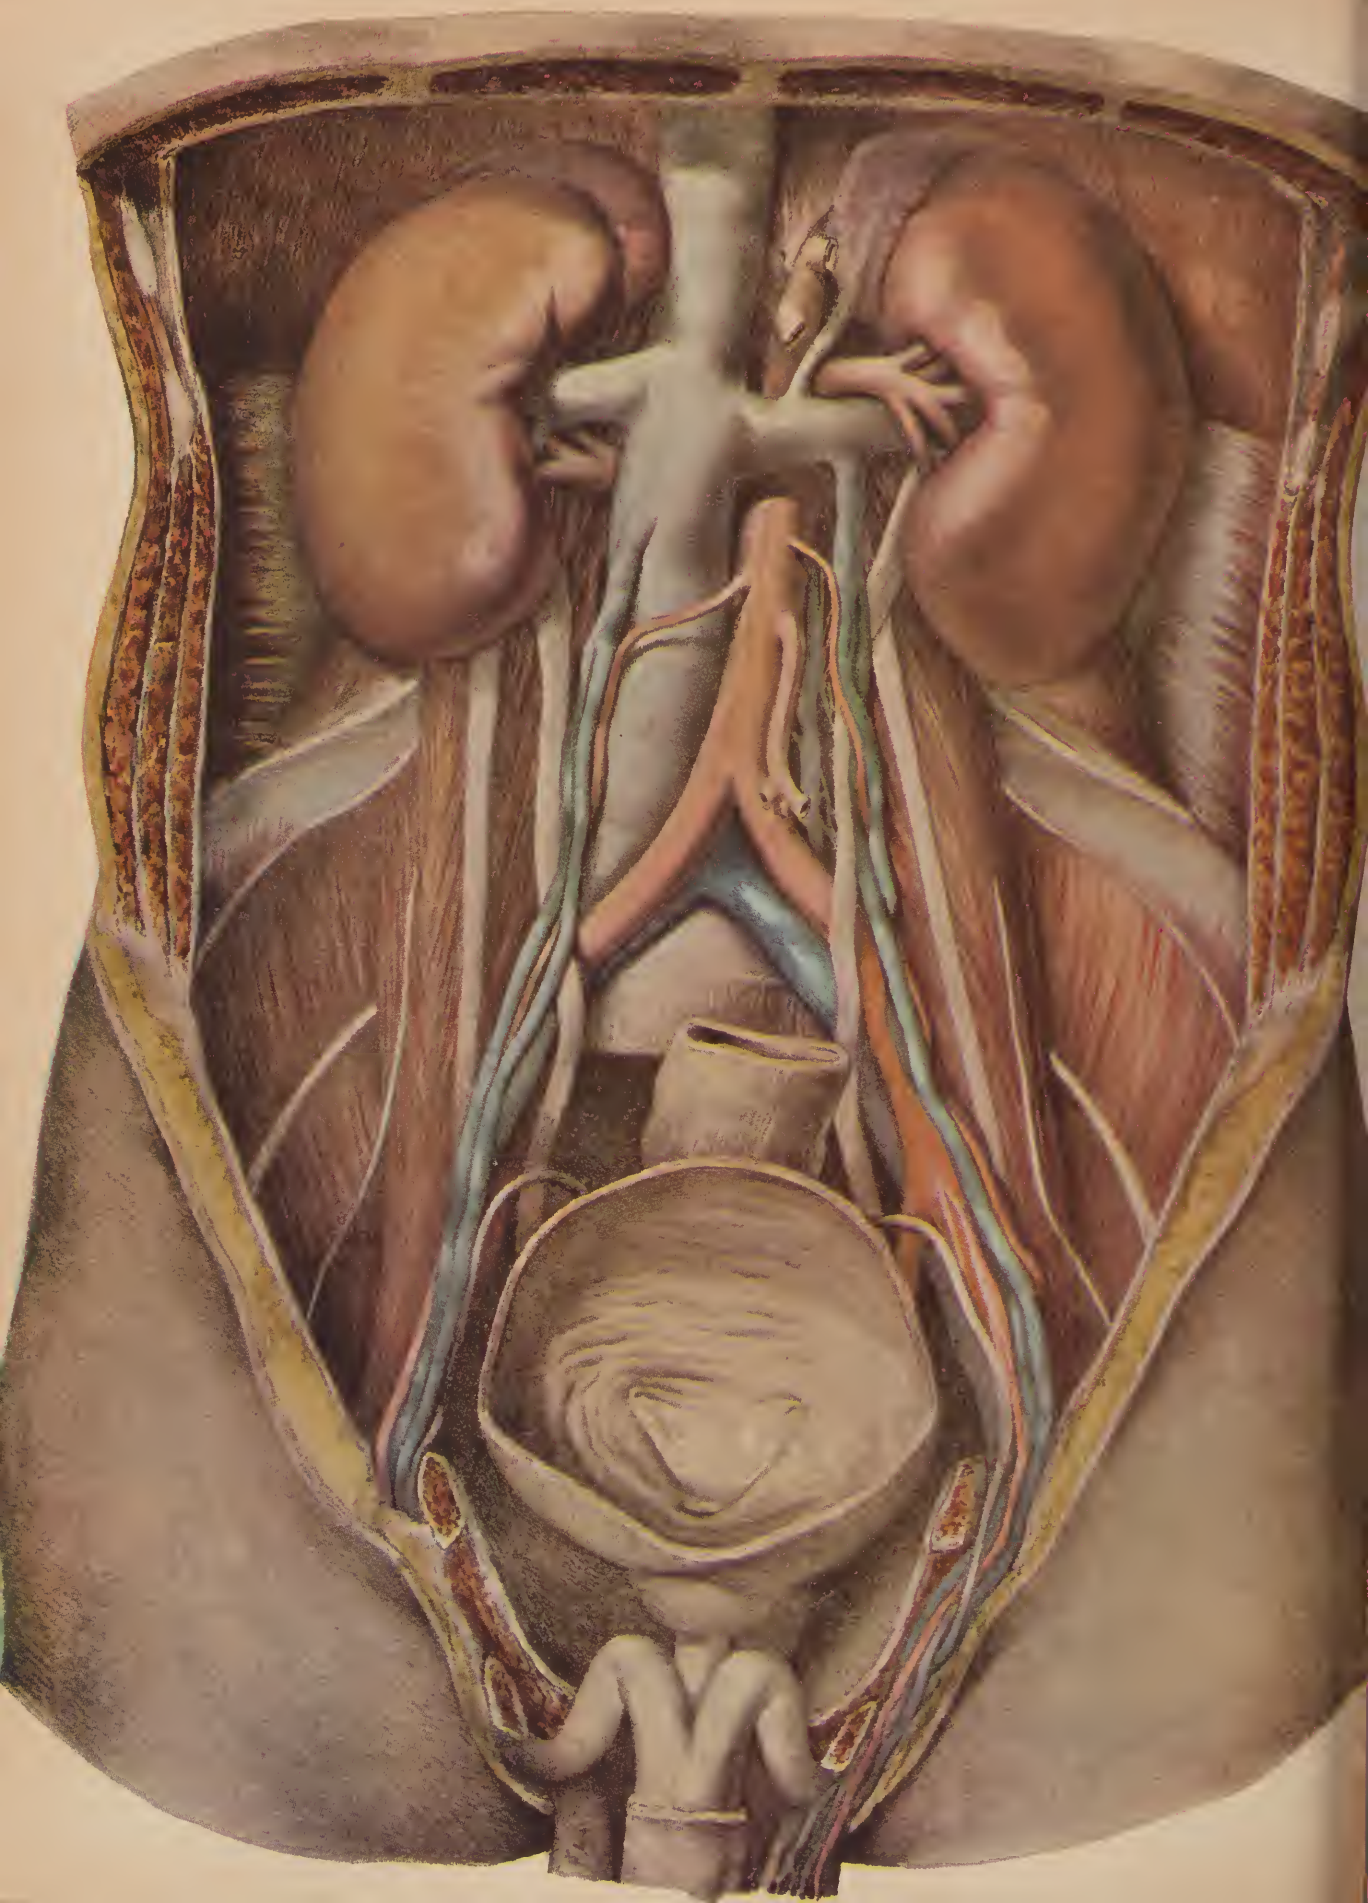
Mason Faulconer Lord, MD
(1926-1965)

Patron of the arts, community leader, philanthropist and physician. BA, Princeton University (1950); MD, Johns Hopkins University School of Medicine (1954); intern (1954-1955), assistant resident (1955-1957), resident (1958-1959), Baltimore City Hospitals; first full-time chief, chronic and community medicine, Baltimore City Hospitals (1963-1965).

Now, now, Mrs. Forsythe, we've never lost a cold patient yet.

When she's experiencing acute discomfort from cold symptoms, it's small wonder the patient becomes distressed about her condition.

She will breathe easier when you prescribe Novahistine LP. Novahistine LP is a long-acting decongestant that helps restore normal mucus secretion and ciliary activity—physiologic mechanisms which prevent infection of the respiratory tract. A dose of two tablets taken in the morning and repeated in the evening will usually keep air passages clear for 24 hours.



Use cautiously in individuals with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Caution patients who operate machinery or motor vehicles that drowsiness may result.

Each Novahistine LP tablet contains: phenylephrine hydrochloride, 25 mg., and chlorpheniramine maleate, 4 mg.

PITMAN-MOORE Division of The Dow Chemical Company, Indianapolis

NOVAHISTINE® LP

For relief of nasal congestion.

Wide-range bactericidal action for genitourinary infections

NEW OMNIPEN® (AMPICILLIN) WYETH

A penicillin that exhibits effectiveness within the gram-positive spectrum of penicillin G* and the gram-negative spectrum of chloramphenicol and the tetracyclines.*

Active at foci of infections—kidney, ureter, bladder or urethra.

Effective against many gram-negative and gram-positive pathogens—thus may be valuable not only in genitourinary but also in common respiratory and gastrointestinal infections.

Normally produces high and persistent levels in blood and high concentrations in bile and urine.

Significant inherent stability.

**Exclusive of penicillinase-producing bacteria.*

Indications: Urinary tract infections, especially those caused by *E. coli*, *Proteus mirabilis*, and *Streptococcus faecalis* and *viridans;* respiratory infections caused by *H. influenzae*, pneumococci, streptococci, and nonpenicillinase-producing staphylococci; and gastrointestinal infections caused by *Shigella* and *Salmonella*, including *Sal. typhosa.*

Contraindications: Hypersensitivity to penicillin; infections due to penicillinase-producing staphylococci and other penicillinase-producing bacteria.

Precautions: If allergic reaction occurs, discontinue ampicillin and administer epinephrine, corticosteroids, antihistamines and/or pressor amines as indicated. Transient moderate elevation of SGOT values of undetermined significance was noted in a few infants. Liver and kidney function as well as hematopoietic tests are advisable during therapy, particularly in infants. As with other antibiotics, precautions should be taken against gastrointestinal superinfection. Safety for use in pregnancy has not been established.

Adverse Reactions: Occasional mild side effects as urticaria, skin rash, pruritus, diarrhea, nausea and vomiting. There have been no reports of blood dyscrasias, liver or kidney damage. Anaphylaxis has been reported.

Composition: Capsules, 250 mg.

American Hospital Formulary Service Category No. 8:12.16.

Wyeth Laboratories Philadelphia, Pa.

Wyeth® SERVICE TO MEDICINE

"Yes, Doctor, the pain is gone."

■ Despite introduction of synthetic substitutes, efficacy of 'Empirin' Compound with Codeine remains unchallenged.

'Empirin'® Compound with Codeine Phosphate gr. ½ No. 3

Each tablet contains: Codeine Phosphate gr. ½ (Warning—May be habit forming), Phenacetin gr. 2½, Aspirin gr. 3½, Caffeine gr. ½.

Keeps the Promise of Pain Relief

BURROUGHS WELLCOME & CO. (U.S.A.) INC., Tuckahoe, N. Y.

disease (including the specialties) are being met at a high level. As newer expensive diagnostic methods are developed, as new specialties arise, costs will increase. Recently developed artificial hearts, artificial kidneys and cardiac pacemakers are forerunners of difficult, and therefore expensive, discoveries of the future. Is each patient to receive the best possible treatment, or are criteria to be set up (for example, in the case of possible use of the artificial kidney) as to who is eligible for certain treatments? Who will make these decisions?

In the care of patients with chronic diseases, there are social, housekeeping and hotel functions which are not purely medical, but bear on the medical care of the patient. Who will decide what amenities the hospital shall offer?

Under Medicare, many of these decisions may rest on the Hospital Utilization Committee, but ultimately perhaps on the Federal Government.

2. What is the Community or Federal Government willing to pay for Good Medical Care?

Medical costs will continue to rise, particularly for care of patients with chronic diseases. This area is where medical care is farthest behind in nursing homes, rehabilitation, diversional activities, mental diseases and alcoholism. The more severe the disability, the more costly and prolonged the treatment—with smaller returns in terms of returning patients to productive capacities.

Closely related to this question is, "What can the community or government afford to pay toward medical care?" Apparently it can pay whatever it is willing to pay if the "affluent society" continues.

It is a mistake, however, to put the problem of available resources purely in economic terms. Money alone does not insure good medical care. Human resources, in terms of people who are willing to spend their lives in all phases of hospital work, must be attracted and satisfaction in the work must be supplied. The quality of care given depends upon the quality of hospital personnel in the lowest to the highest jobs.

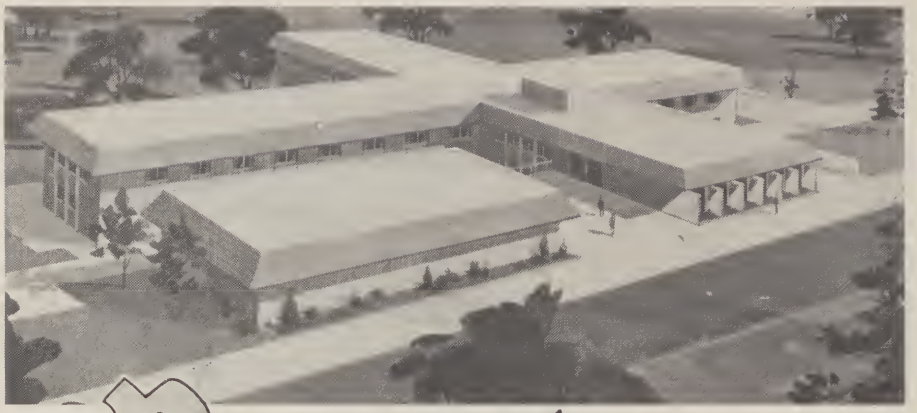
3. What will be the effect of the increasing trends toward specialization, bureaucracy and third party payments on medical care?

Each of these movements arose in response to a problem. Specialization in the hospital and medical school arose because one man could not be proficient in all fields and because there were enough patients collected in the hospital to allow the specialist to make a living dealing with selected patients. With specialization, concern with the disease rather than the patient resulted.

Bureaucracy arose in an attempt to deal efficiently and rationally with large numbers of people by a common prescribed method.[3, 4]

Third party payments arose out of the increasing effectiveness of medical diagnosis and treatment, a rise in expectations as to what health care could accomplish, the poor distribution of medical care, and the rise in cost of medical care.

Each of these trends solved essential problems, but brought with it new difficulties. Together, all three have conspired to treat the patient as a thing rather than a person, to isolate the patient from essential emotion support, and to change the practice of medicine from a vocation to a profession, with probable deleterious effects on the quality of those entering medicine.



Postscript and Acknowledgements

Hospital histories are written for various purposes: some in praise of famous men; some as apologias; some as preludes to financial drives; some in celebration of an anniversary; some to trace the development of scientific medicine.

This history of the Baltimore City Hospitals has had a completely different purpose. It has been an attempt to understand the scientific, social, cultural, philosophical and governmental forces which have influenced the evolution of an institution from an almshouse to a hospital. A hospital today can fulfill its purpose only when the community is sympathetic to its aims and is willing to make sacrifices to assure good medical care. Social forces shaping hospital care are rapidly growing. It is important for the physician to understand these forces, if he is to channel his professional activities most effectively toward better medical care.

Breast-feeding and the "modern mother"

Despite a mild resurgence of interest in the importance of breast-feeding a few years ago, many women today do not choose to nurse their young. This is for a variety of reasons—social, economic, cultural and sometimes medical. In such cases the physician's task is to find the most suitable means of preventing lactation and easing the pain of breast engorgement.

The means of therapy

The value of hormone therapy for this indication is of course well established. Both androgen and estrogen are known to inhibit the production and secretion of the lactogenic hormone by the anterior pituitary. As estrogen levels decline sharply at parturition, lactogenesis is established. When androgen and estrogen are administered to the patient before the release of the lactogenic hormone lactation and breast engorgement are usually prevented.

The time of therapy

The time of administration of this combined medication is crucial; it must be given early enough to suppress the pituitary prolactin and last long enough to permit physiologic readjustment during the puerperium. Excellent results are most often seen when therapy is administered before the onset of the second stage of labor.

However, factors other than effectiveness must also be considered. The agent selected should not interfere in any way with parturition, subsequent uterine involution and the restoration of normal ovarian cyclic function. Furthermore, it should not cause rebound breast engorgement or other manifestations of hormonal imbalance.

A balanced formulation

Providing single-dose therapy for the prevention of lactation and breast engorgement, Deladumone OB is a potent androgen-estrogen combination with a prolonged action. The optimal balance of androgenic and estrogenic hormones achieved in this preparation minimizes the disadvantages inherent in single hormone therapy, such as rebound breast engorgement. Involution of the uterus and resumption of menstrual cycles are not affected.

As reported in a recent published study (Roser, D. M.: Obstet. & Gynec. *27*:73, 1966), Deladumone OB provided good suppression of breast engorgement in 95.3% and suppression of lactation in 81.1% of 86 obstetrical patients. These results are in general agreement with those of many earlier investigations; in several studies this injectable androgen-estrogen combination proved to be superior to oral medication.

Dosage:

As a single injection of 2 cc. before the onset of the second stage of labor.

Contraindications:

Established or suspected mammary cancer or genital malignancy.

Precautions and Side Effects:

Certain patients may be unusually responsive to either estrogenic or androgenic therapy. In such individuals virilization, uterine bleeding or mastodynia may occur.

Supply:

Deladumone OB, providing 180 mg. testosterone enanthate and 8 mg. estradiol valerate per cc., is available in 2 cc. Unimatic® disposable syringes and in 2 cc. vials. Both preparations are dissolved in sesame oil, with 2% benzyl alcohol as a preservative. *Before use, consult product literature for full prescribing information.*

COMPONENT MEDICAL SOCIETIES

ANNE ARUNDEL COUNTY

The Anne Arundel County Medical Society held its regular October meeting at the Coachman's Inn on Ritchie Highway on October 19. A good representation of the Society membership was present. Following the usual cocktail hour and dinner, the meeting was called to order by the president, **Logan Holtgrewe, MD. W. J. Peebles, MD,** Commissioner of Health for the State, was the speaker of the evening. He talked about the State Medical Aid Program, its problems, and possible future developments. **Dr. D. T. Boyd,** assistant commissioner of health for Community Health Services also made a few comments. A number of questions were raised from the floor and were discussed.

In keeping with the by-laws, three new members, **Drs. Charles Hargrove, Horace Cholmondeley,** and **Robert O. Biern** were elected to the Society as associate members.

A system of radio paging and communications through an answering service was briefly mentioned. It was suggested that interested individuals could contact **Samuel Borssuck, MD,** or the Annapolis Message Center for further details which would be available as soon as they were more clearly defined and worked out. It was suggested that this could help towards the ever growing problem of reaching physicians outside their usual office hours.

The annual election of officers will be held at the next regularly scheduled meeting and the nominating committee, consisting of Dr. Borssuck as chairman and four past presidents of the Society, were instructed to bring nominations to the Society in accordance with the by-laws.

Samuel Borssuck, MD

WASHINGTON COUNTY

The Washington County Medical Society met at the Venice Motel on Thursday, September 22, 1966, with members of the Washington County Bar Association and of the Washington County Ministerial Association as invited guests.

Edward Davens, MD, Deputy Commissioner of Health for the State of Maryland, was the speaker. His topic was "Maryland's Medical Assistance Program," the program administered under the provisions of Title XIX of Public Law 89-97, better known as the Medicare Act.

The second part of the program was devoted to a panel discussion on the interrelationship of law, medicine, and religion. Two lawyers and two clergymen participated on the panel, and **William Beckner, MD,** chairman of the Medico-Religious Committee of the Medical Society, served as moderator. **James W. Banks, MD,** chairman of the Medico-Legal Committee of the Medical Society, served as co-chairman with Dr. Beckner in planning the joint meeting.

Two members of the Medical Society were honored as past presidents of the Medical and Chirurgical Faculty of the State of Maryland. **Bender B. Kneisley, MD,** who served as president in 1954, and **Robert vL. Campbell, MD,** who served as president in 1965, were each presented with a properly engraved plaque commemorating the year of service.

John W. Clark, MD, DDS, Hagerstown plastic and reconstructive surgeon, attended the International Meeting of the Latin American Society of Plastic Surgery in Lima, Peru, October 10 through 22. Dr. Clark presented two papers in Spanish, using illustrations and displays to supplement his lectures. His topics were "Repair of Facial Bone Fractures" and "Forehead Flaps."

Dr. Clark has been in private practice for the past five years in Hagerstown; he is married and has four children. Mrs. Clark and his two older children accompanied him on the trip.

Dr. Clark is a diplomate of the American Board of Plastic and Reconstructive Surgery, and a fellow of the American College of Surgeons and of the American Association of Maxillofacial Surgeons. He is secretary of the Washington County Medical Society.

* * * * *

Two local physicians played prominent roles in the 20th annual meeting of the Heart Association of Maryland held in Gaithersburg in October.

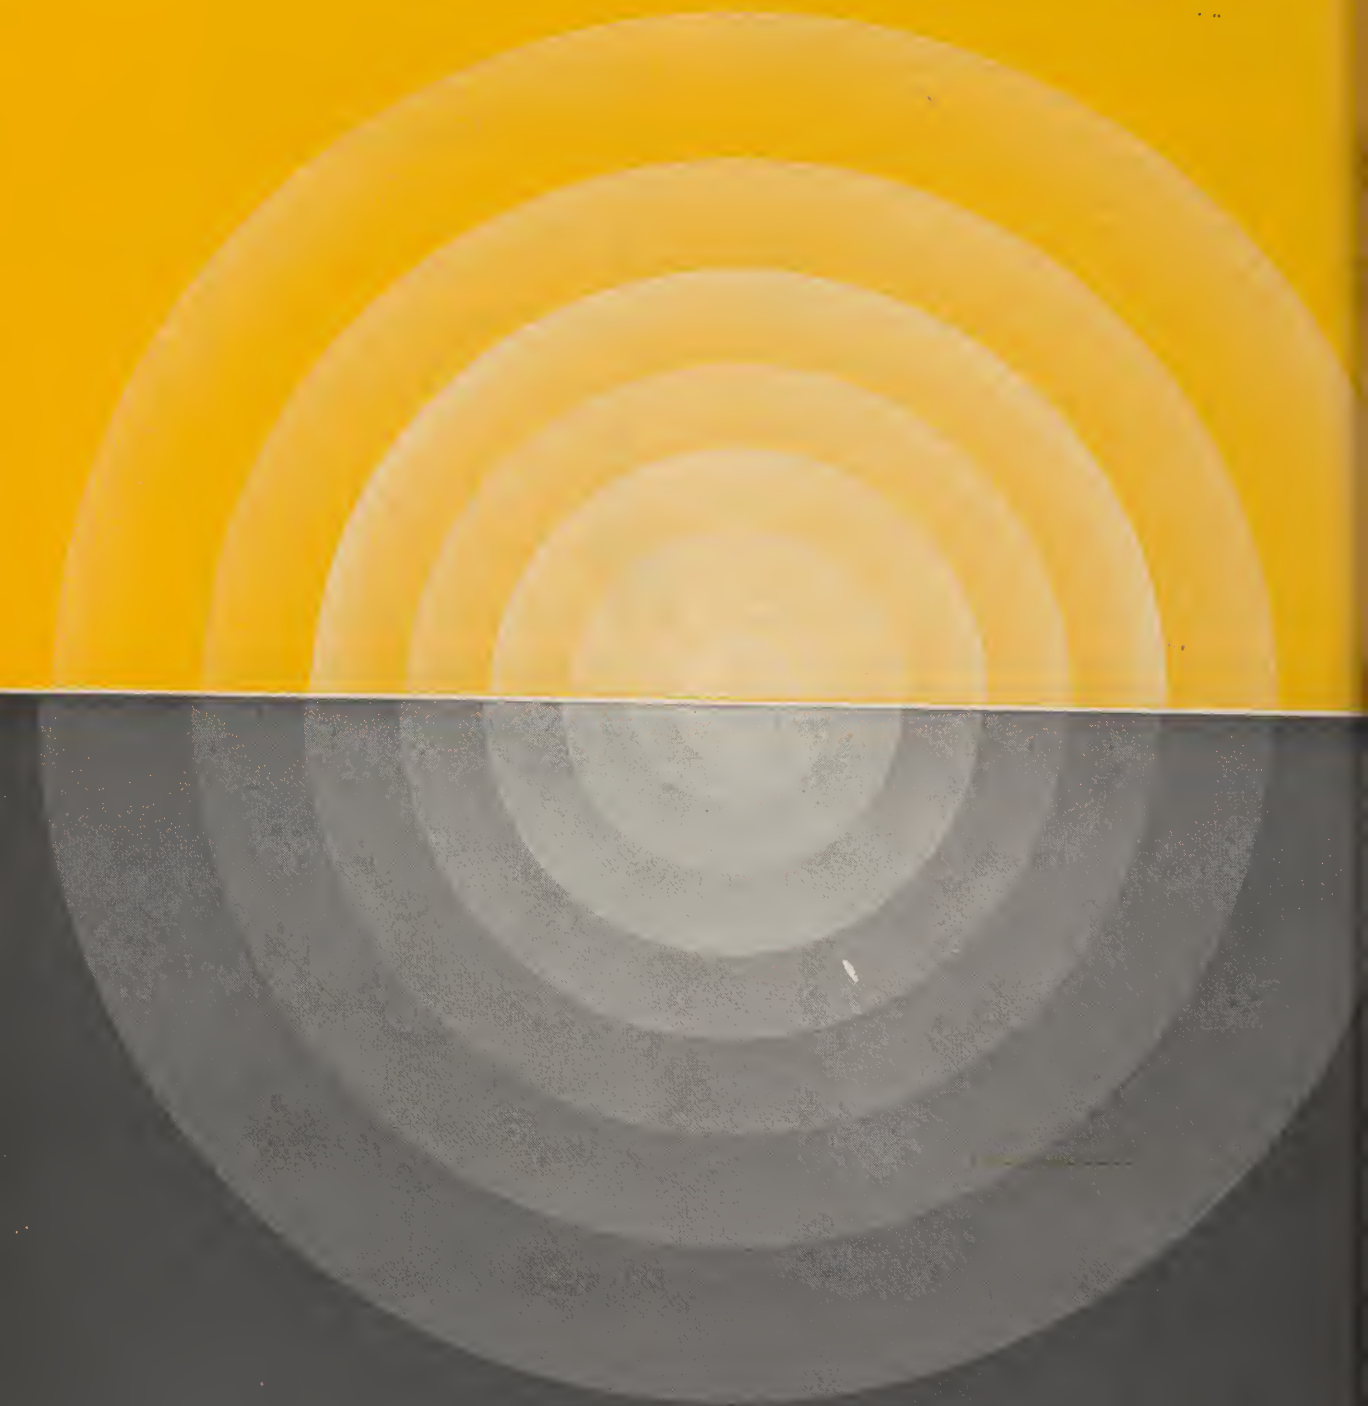
John C. Stauffer, MD, a representative of the Washington County Heart Association, was installed as vice-president of the State association.

Richard A. Young, MD, received the Heart Association's silver service recognition award for outstanding service over the years to both the Washington County and Maryland groups.

Charlotte R. Warden
Executive Secretary

WICOMICO COUNTY

Walter J. Levinsky, MD, associate professor of Medicine at Temple University in Philadelphia, was guest speaker at the October meeting of the Wicomico County Medical Society in Salisbury. Dr. Levinsky's topic was "Psycho-Therapeutic Agents: Do's and Don'ts."



At the business session of the October meeting, an amendment to the by-laws was approved which granted Executive Committee membership to all Society members who hold office or are members of the Council at the State level.

Further business included a report on the public speaking seminar presented in Salisbury in late September by Smith Kline & French Laboratories.

and one in the evening

Now b.i.d. convenience plus even greater patient savings over q.i.d. tetracycline therapy

(plus all the advantages of tetracycline phosphate complex)

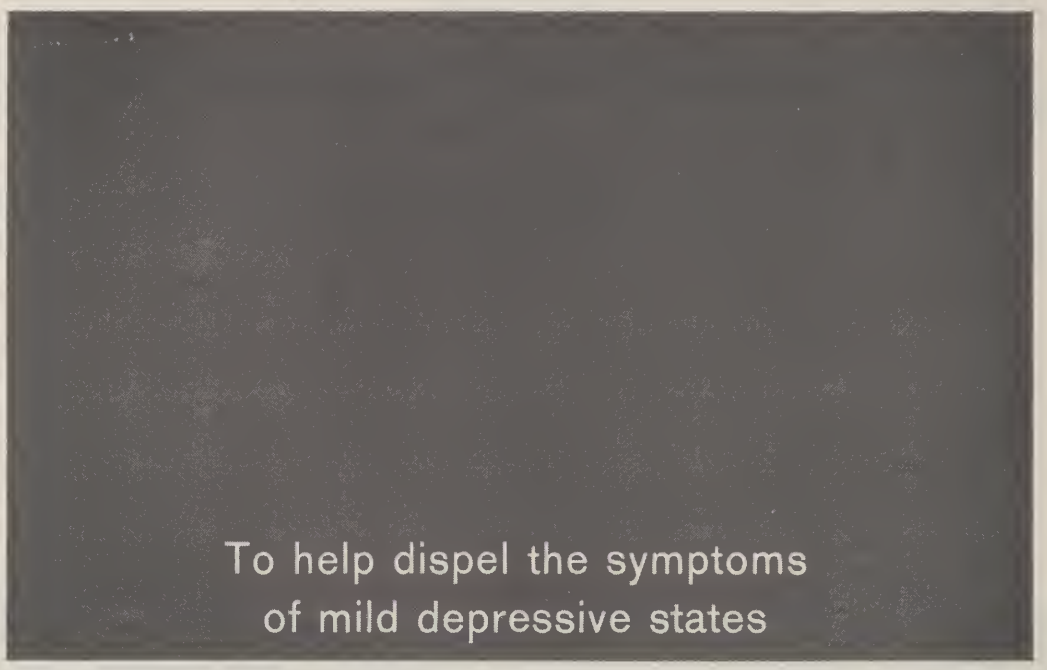
new Tetrex® bidCAPS*

(tetracycline phosphate complex)

Maximum patient savings. New bidCAPS now enable you to prescribe tetracycline in an even more economical, more convenient form. Your patient's prescription dollar gets maximum value: a day bidCAPS dose is priced lower than any other leading brand of tetracycline—b.i.d. or q.i.d.

Well tolerated. Tetrex (tetracycline phosphate complex) is well tolerated. Gastrointestinal side effects are few; photodynamic reactions are extremely rare.

More of the active antibiotic in the blood. The basic tetracycline in Tetrex (tetracycline phosphate complex) is less bound to serum protein than is demethylchlortetracycline.[1] Result: Tetrex (tetracycline phosphate complex) provides a higher percentage of active antibiotic in the blood.



Available in bottles of 16 and 50.

BRISTOL LABORATORIES
Division of Bristol-Myers Company
Syracuse, New York

BRISTOL THERAPEUTIC SUMMARY: For complete information consult Official Package Circular. *Indications:* Infections of respiratory, gastrointestinal and genitourinary tracts and skin and soft tissues due to tetracycline-sensitive organisms. *Contraindications:* The drug is contraindicated in individuals hypersensitive to tetracycline. *Warnings:* Photodynamic reactions have been produced by tetracyclines. Natural and artificial sunlight should be avoided during therapy. Stop treatment if skin discomfort occurs. With renal impairment, systemic accumulation and hepatotoxicity may occur. In this situation, lower doses should be used. Tooth staining and enamel hypoplasia may be induced during tooth development (last trimester of pregnancy, neonatal period and childhood). *Precautions:* Mycotic or bacterial superinfection may occur. Infants may develop increased intracranial pressure with bulging fontanels. In gonorrheal therapy, seralogic tests for syphilis should be conducted initially and monthly for 3 months. Adverse *Reactions:* Glossitis, stomatitis, nausea, diarrhea, flatulence, proctitis, vaginitis, dermatitis and allergic reactions may occur. *Usual Adult Dose:* 500 mg. b.i.d. Continue therapy for 10 days in beta-hemalytic streptococcal infections. Administer one hour before or two hours after meals.

*bidCAPS is a trademark of Bristol Laboratories, Division of Bristol-Myers Company, for its brands of twice-a-day capsules. Each Tetrex bidCAP contains Tetrex (tetracycline phosphate complex) equivalent to 500 mg. tetracycline HCl activity.

CONSIDER **DEXAMYL**® FIRST

brand of dextroamphetamine sulfate and amobarbital

Often within the hour, 'Dexamyl' works to help dispel such symptoms as apathy, pessimism, loss of interest and initiative, and lack of ability to concentrate.

Formulas: Each 'Dexamyl' Spansule® capsule (brand of sustained release capsule) No. 1 contains 10 mg. of Dexedrine® (brand of dextroamphetamine sulfate) and 1 gr. of amobarbital, derivative of barbituric acid [Warning, may be habit forming]. Each 'Dexamyl' *Spansule* capsule No. 2 contains 15 mg. of Dexedrine (brand of dextroamphetamine sulfate) and 1½ gr. of amobarbital [Warning, may be habit forming].

The following is a brief precautionary statement. Before prescribing, the physician should be familiar with the complete prescribing information in SK&F literature or *PDR.*

Precautions: Use with caution in patients hypersensitive to sympathomimetics or barbiturates and in coronary or cardiovascular disease or severe hypertension. Do not use in patients taking MAO inhibitors. Excessive use of the amphetamines by unstable individuals may result in a psychological dependence; in these instances, withdraw the medication. Use cautiously in pregnant patients, especially in the first trimester. *Side effects:* Insomnia, excitability and increased motor activity are infrequent and ordinarily mild.

Mode of Action of Antimicrobials

MOHSEN ZIAI, MD
Associate Professor of Pediatrics
The Johns Hopkins University School of Medicine

An antimicrobial agent is useful if it can interfere with metabolic reactions of the microorganism that do not exist in the host cells or, if they do, are not accessible by the drug. This phenomenon is known as selective toxicity. There are three possible sites for the effect of antimicrobials, although it is possible for an antimicrobial agent to act on more than one of them. These sites are:

1. The cell wall
2. The cytoplasmic membrane
3. The cytoplasmic metabolic processes

1. Interference with the Formation of Cell Wall

One of the fundamental ways that bacteria differ from animal cells is that each possesses a rigid cell wall which surrounds its cytoplasmic membrane. This cell wall is not to be confused with an additional covering, the capsule, present in certain bacteria.

It is possible to remove the bacterial cell wall. What is left of the bacterial cell is then known as a protoplast. The protoplasts (or L forms) differ functionally from normal bacterial cells in that they have lost their resistance against osmotic lysis, a function ordinarily provided by the rigid cell wall. If one provides a delicately balanced osmotic medium for the protoplasts, they will continue to survive and multiply.

Penicillin interferes with the formation of bacterial cell walls. It consequently produces a lethal effect upon bacteria by making them susceptible to osmotic lysis. This action is exerted on the gram negative as well as the gram positive bacteria, although to a lesser degree. If bacteria are kept from multiplying, penicillin will have no effect on them. Resistance to penicillin is due to the production of penicillinase, which destroys penicillin, although certain mutants are found that are not penicillinase producers, but are nevertheless resistant to the action of this drug.

Novobiocin and bacitracin also act at this site, ie, on the cell wall.

2. Damage to the Cytoplasmic Membrane

The cytoplasmic membrane has an extremely important role in the life of the bacterial cell. It acts as a barrier which regulates the movement of various substances to and from the surrounding medium, thus controlling the permeability of the cell. It makes it possible for the bacterial cell to maintain far greater concentrations of certain metabolites, such as sugars and amino acids, within itself: this phenomenon produces a very high osmotic pressure. Important metabolic lesions can be produced on the bacteria by any damage to the cytoplasmic membrane. Examples of this mode of action are polymyxin, colistin, and streptomycin.

3. Interference with Cytoplasmic Metabolic Processes

Several cytoplasmic metabolic processes of bacteria can be deranged by antimicrobials. Some of these are only of academic interest and provide a method for studying normal cell physiology. Others are of practical importance in the treatment of infectious diseases. These are as follows:

a. Inhibition of Protein Synthesis

Chloramphenicol is the most extensively studied member of this group, although other antibiotics, eg, tetracyclines, erythromycin and streptomycin, also act in this general manner. Their exact mode of action is, however, different. Chloramphenicol is thought to work at the ribosomal phase of protein synthesis, ie, preventing the normal attachment of genetic messenger RNA to ribosomes.

b. Metabolic Analogues

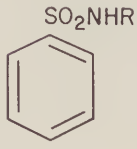
Sulfonamides were the first group of substances to be used as effective antibacterial drugs. These compounds are structurally similar to para-aminobenzoic acid (PABA), which is essential as a building block in the synthesis of folic acid by certain bacteria. This structural similarity produces confusion. Using the sulfonamides instead of PABA therefore prevents the multiplication of these pathogens. This mechanism of drug action is known as competitive inhibition. If the amount of PABA is increased, or the drug decreased, the quantitative effect will no longer be adequate. Such is the case in abscess cavities where tissue destruction leads to excess availability of PABA.

The mode of action of para-amino salicylic acid (PAS) is also through this mechanism. (See Figure).

Antimicrobial Therapy of Non-bacterial Infections

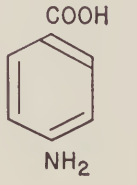
1. Viruses and Rickettsia

One would expect no selective antimicrobial drug action against viruses and Rickettsia as these are obligate intercellular parasites. In clinical practice, however, this is not the case.



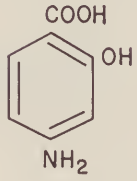
Rickettsial infections respond to tetracyclines and chloramphenicol, thus indicating that these drugs can penetrate into the host cells and selectively destroy the pathogen. Similar observations can be made with regard to certain virus infections such as trachoma, lymphogranuloma venereum and primary styptical pneumonia.

2. Protozoa



The mode of action of drugs against this group of pathogens is varied. Antitrypanosomal agents, for example, act through interference with nucleic acid synthesis in these organisms. In case of some other pathogens, such as E. histolytica, the drugs may act primarily on the host, making the environment that he provides for the parasite less favorable.

3. Fungi



Antifungal drugs generally act on the cytoplasmic membrane.

Sulfonamides

PABA (Para-Aminobenzoic Acid)

PAS (Para-Aminosolicylic Acid)

Summary

It is apparent from the foregoing discussion that antibiotics differ altogether from certain other compounds such as antiseptics in their method of destroying the disease-producing organisms. A comprehension of the mechanisms involved in the interplay between the drug and parasite is important in taking an intelligent approach to chemotherapy of infections.

Exercise Tests in Heart Disease

DOUGLAS G. CARROLL, MD
Chief, Physical Medicine and Rehabilitation
Baltimore City Hospitals

"Thus use of exercise in clinical practice is the most neglected sector of medical therapy."[1]

Exercise tests have a number of potential uses in clinical medicine. If there were a simple, reproducible and reliable test it could be used in the office or at the bedside to estimate cardiac performance. Unfortunately, however, there is no such test.

Existing exercise tests may be used in difficult cases to obtain an objective measurement of performance, particularly in evaluation for operation. They may also be used to estimate energy expenditure in certain jobs to determine whether the latter can be safely performed by patients with heart diseases.[2, 3]

Newman[4] has outlined an exercise program for bed patients following acute myocardial infarction. These exercises could be used to measure exercise tolerance during the acute stage of heart disease, but most exercise tests are performed after recovery from myocardial infarction or when cardiac compensation is established.

If a simple exercise tolerance test (such as walking up a flight of stairs) is administered carefully and used with the history and physical examination, it is estimated that, in 65% of the more difficult cases referred to a Work Evaluation Unit, the physician can give an accurate evaluation of what the patient can perform safely.[5]

STEP TESTS

Angina pectoris and shortness of breath are two symptoms warning that cardiac reserve is being overtaxed. The following are some of the standardized step tests which are useful in estimating exercise tolerance and which may be applied to patients with heart disease:

1. The Schneider Test

In the early 1920's, Schneider[6, 7] described an exercise test useful to estimate "physical fitness" in army recruits. The test consisted of taking control pulse rates with the subject recumbent, standing and reclining. The subject then exercised by stepping up five 10½ inch steps in 15 seconds. Following the exercise, the time required for the pulse to return to normal was recorded. A large number of presumably normal inductees were tested by this procedure and standards were derived. Unfortunately, a number of factors other than exercise tolerance affected the pulse rate, the test took too long to perform, and it was not standardized on cardiac patients.

2. Master's Two-Step Test

Initially developed as an exercise tolerance test[8] or test of myocardial function,[9] the Mas-

ter Two-Step Test is now widely used as a standard stress test to elicit electrocardiographic changes associated with insufficiency of coronary blood supply.[10] The original amount of stress was standardized on normal people of varying weights and ages, to conform with a standard return of pulse rate and blood pressure to the resting level within two minutes of the end of exercise. Ford and Hellerstein[11] have shown that the test requires an oxygen consumption of about 6.8 times resting oxygen consumption. This is not a steady state type of exercise, and resembles most of the tasks performed in ordinary housekeeping or on the job. The amount of work is equal to that of stair climbing and is greater than the peak requirement of most non-laboring work. The Master's Two-Step Test was shown[11] to impose equal energy demands on patients of different ages and weights and to be safe for patients with stable heart disease if done under careful supervision. The authors conclude that the physiologic and electrocardiographic response to the Master's Test can provide a sound basis for counseling in regard to activities both at work and in ordinary daily activities. This is the best standardized exercise test for patients with heart disease and is adequate for evaluation of exercise tolerance.

3. Harvard Fatigue Laboratory Step Test[12]

This test has not been extensively used on patients with heart disease, probably because it is too vigorous. The scoring has been standardized on normal young volunteers. It attempts to measure "physical fitness." It is dependent on pulse rate taken one minute after a standardized step exercise. Its advantage is that a number can be obtained which relates pulse response to normal values.

4. Baldwin, Cournand and Richard's Step Test

This test[13] has been well standardized on normals and extensively used in patients with respiratory diseases. It is easy enough to be

	MEASUREMENT								
Test	ECG	Pulse Rate	BP	VE	VO_2	FaO_2	Resp Rate	FIO_2-FEO_2	
Master[10]	B R	R							Step Test
Harvard[12]		R							Step Test
Cournand[13]		R		B E R	B E R	B R	B R	B E R	Step Test
Los Angeles[11]	B E R	R	B E R						Step Test
Bruce PFI[15]	B E R	R					E		Step Test
Bruce PFI	B E R	B E R	B E R						Treadmill

Table 1
Comparison of Information Collected in Various Tests of Exercise Tolerance

B = Measurement made at rest
E = Measurement made during exercise
R = Measurement made during recovery period

performed by patients who are short of breath, since it requires only 30 steps up and down a 20 cm step in one minute. Oxygen consumption, ventilation and pulse rate are measured at rest, during the exercise, and for each minute of the five-minute recovery period. In addition, the arterial blood saturation is determined immediately after exercise, and the degree of dyspnea and ventilation during recovery are related to the maximal breathing capacity. The test measures ventilation and respiratory insufficiency, but could be modified for use in patients with heart diseases.

5. Los Angeles Work Classification Unit Exercise Tolerance Test[14]

This test lasts for ten minutes, with 20 steps per minute up an eight-to-nine-inch step. Pulse rate, blood pressure, electrocardiography, signs and symptoms are recorded during exercise and/or for three minutes after exercise.

The energy required for the test is four to five times basal level and is carried on for a longer period than the other tests.

6. Physical Fitness Index (Step-test method)

Bruce[15] has described a step test at 20 times per minute for 10 minutes in which the average respiratory rate per minute of exercise and the cumulative heart rate for the first three minutes of recovery are measured. Physical Fitness Index (step-test) $= \frac{E\ (k^1)}{(r^1)\ (c)} \times \frac{S}{20}$ where E is time of exercise (10 minutes), k^1 is 10,000, r^1 is average respiratory rate during exercise, c is cumulative heart rate during first three minutes of recovery. S is the number of steps per minute. This test has the advantage of requiring no complicated equipment and of giving a number which may be compared to normal values.

Step tests are simple, are safe if performed under supervison by a physician, and give the information needed to prescribe amount of exercise. All except the Harvard Fatigue Laboratory Step Test require interpretation of the findings and the symptoms by a physician. The Harvard test has not been widely applied to patients with heart disease, but has the possible advantage of allowing quantitative comparisons with normals and other patients. Whether so complex an activity as exercise tolerance in a patient with heart disease can be quantitated in a significant manner remains to be seen.

Since most ordinary daily work consists of intermittent non-steady state exercise with peaks of energy expenditure, non-steady state exercises may be more valuable for predicting safe exertion than the steady state tests.

TREADMILL TESTS

Although treadmills are somewhat more expensive and unwieldy than steps, they are preferable for precise work. Skill and training factors are not as important on the treadmill and the patient does not have to keep time in stepping. Following are two treadmill tests:

1. The Physical Fitness Index (Treadmill Method)

Over a number of years Bruce[16] has been attempting to standardize a test for physical fitness which may be applied to patients with heart disease. The test requires 10 minutes of walking on a treadmill at a 10% grade at 1.7 mph. Signs and symptoms, electrocardiogram, pulse, blood pressure and oxygen consumption are determined during exercise and during three minutes of recovery. The Physical Fitness Index $= \frac{(E)\,(r)\,(100)}{C}$ where E is the duration of exercise (usually 10 minutes), r is average difference between inspired and expired oxygen percent during exercise ($FIO_2 - FEO_2$) and C is the cumulative heart rate for the first three minutes of recovery. A normal PFI is from 13 to 26.

Class III and IV cardiac patients generally cannot complete the full 10 minutes. Class II patients can generally complete the exercise, but may have some dyspnea of moderate intensity. Class I patients usually show slight, if any, symptoms. Electrocardiographic changes are frequent in Classes III and IV. The actual time the patient can walk on the treadmill is the most important measurement. Completion of the test without severe dyspnea requires energy equivalent to ordinary laboring work in industry.

2. Estimation of maximal oxygen consumption

If it were possible to determine easily, the measurement that would be most helpful in estimating work potential would be maximal oxygen consumption in a steady state. This

measurement is directly related to maximal energy expenditure and maximal cardiovascular function in normals[17, 18] as well as in patients with heart disease.[19] Methods have been perfected for this determination in normal men on treadmills,[20] but it has been difficult to perform this test in patients with heart disease because maximal exertion is considered dangerous.

Since a number of variables besides oxygen consumption increase during exercise, it might be possible to take several levels of mild exertion and predict maximal oxygen consumption in patients with heart disease. This prediction has been attempted in a limited number of healthy young men,[20] but the results have not been completely reported.

Wyndham and Ward[21] have attempted to estimate maximal oxygen intake in patients with heart disease by measuring pulse rate and oxygen consumption a low work levels, and extrapolating to a pulse rate of about 200 per minute, with the assumption that oxygen consumption is maximal at this heart rate.

Another approach would be to predict maximal minute ventilation from the maximal breathing capacity performed at rest. Dripps and Comroe[22] have reported a mean expiratory minute volume at peak oxygen consumption of 66% of mean maximal breathing capacity in normal men from 21 to 26 years of age. Slonim, Gillespie and Harold[20] give a value of 83% of mean maximal breathing capacity as the point of peak oxygen consumption for their normal subjects. Whether these figures are applicable to patients with heart disease is not yet known.

Functional Classification	Approximate Allowable Maximal Calories/Minute Expenditure in Non-Steady State Exertion	Activities of Intermittent Nature in Order of Descending Exertion
I No Restriction of Ordinary Activities	4-6.6	Carrying up to 50 pounds, heavy carpentry, sawing soft wood, walking 3.75 mph, dancing, bedmaking, golfing, swimming (20 yds per min), wheel barrow (115 pounds at 2.5 mph), hanging wash, bowling, showering, mopping (standing), plastering, playing drums, vacuuming rug (4 ft/sec)
II Slight Restriction of Ordinary Activities	2.7 to 4	Making beds (not stripping linens), cleaning windows, scrubbing floors, walking 2.5 mph, using bed commode, dressing, washing, shaving, industrial finishing and lathe turning, volley ball, motor cycling, kneading dough, laboratory work, sheet metal work, slow horseback riding, canoeing 2.5 mph, washing small clothes, cobbling shoes, industrial machine sewing, driving car, factory assembly work, radio assembly, playing violin.
III Marked Restriction of Ordinary Activities	1 to 2.7	Washing and dressing, vacuuming rug (3 ft/sec), playing piano, light machine work (engineering), polishing furniture, wheelchair propulsion, recreational painting (standing), armature winding, wringing clothes by hand, playing cards, walking 1.1 mph, weaving (floor loom).
IV Severe Restriction of Physical Activities	1 Calorie/min.	Sitting or resting supine.

Table 2
Functional Classification of the American Heart Association and Caloric Cost of Certain Activities[23, 24]

SUMMARY

For at least 45 years physicians have been trying to develop a simple office test of exercise which will give a reliable measure of cardiac performance. Unfortunately such tests as have been designed require either too much time or expensive equipment. Until such a time as an ideal test is designed, that of walking the patient up a flight of stairs and observing his pulse and degree of dyspnea is usually adequate. Patients who need more precise testing for job placement or for surgical evaluation may be referred to the Work Classification Unit of the Maryland Heart Association or to a hospital exercise physiology laboratory.

MOLECULAR REMODELING—

laboratory exercise or clinical necessity?

More than twenty-five years have passed since the discovery of the diuretic activity of sulfanilamide started pharmacologists on a succession of molecular remodelings to find the ideal diuretic.

Diuresis—a sought-after clinical effect from an unwanted side effect

It started in 1937 when a clinician reported that the administration of a sulfonamide was sometimes accompanied by an unexplainable side effect—metabolic acidosis.[1] Three years later the side effect was explained. The sulfonamide radical of sulfanilamide inhibited carbonic anhydrase,[2] the enzyme responsible for converting carbon dioxide and water to hydrogen ions and bicarbonate ions.

Later, other investigators showed by dog experiments that metabolic acidosis probably resulted when the inhibition of carbonic anhydrase upset the exchange of hydrogen and sodium ions, causing increased excretion of sodium as the bicarbonate.[3]

It was twelve long years after the first report of the unexplainable side effect (metabolic acidosis) that it was finally shown that large doses of sulfanilamide administered to edematous patients were indeed capable of promoting diuresis.[4] However, the possibility of toxic effects from its prolonged use and its relatively weak diuretic action made it impractical for clinical use as a diuretic.[5]

Because the inhibition of carbonic anhydrase seemed to be the key to effective diuresis, investigators began to look for more potent enzyme inhibitors —in the hopes that they would be more effective diuretics.

The most important of these early compounds, acetazolamide, enjoyed several years of fairly wide clinical use.

Its carbonic anhydrase inhibitory activity was several hundred times greater than that of sulfanilamide.[6] The increase in inhibitory activity, however, increased not only the excretion of sodium and bicarbonate ions, but also the excretion of potassium.[7] And, like its predecessor, acetazolamide precipitated mild acidosis. Its prolonged use could result in hypokalemic acidosis.[7]

The 'thiazides'—an answer to the metabolic acidosis caused by carbonic anhydrase inhibition

Despite the fact that the sulfonamide group appeared to be responsible for carbonic anhydrase inhibition which in turn appeared to be responsible for diuresis, investigators began to synthesize compounds with structural alterations to the sulfonamide group.

The first major breakthrough came with the synthesis of chlorothiazide. Altering the sulfonamide group did indeed alter the ability of chlorothiazide to inhibit carbonic anhydrase—it was only 1/10th as potent as acetazolamide in inhibiting the enzyme.[8] Despite the drop in inhibitory potency, however, chlorothiazide proved to be an effective diuretic—an observation that led to the conclusion that its diuretic action was due to some mechanism other than its action on carbonic anhydrase.[9,10]

For effective diuresis, chlorothiazide was administered in daily dosages ranging from 250 to 2000 mg.[11] It increased the excretion of sodium and chloride; and, to a lesser extent, potassium and bicarbonate.[11] The excretion of potassium appeared to be maximal at higher dose levels at which, theoretically, the carbonic anhydrase inhibitory effect is more active.[11] Its prolonged use, therefore, could sometimes result in metabolic hypokalemic, hypochloremic alkalosis.[7]

Naturetin—effective diuresis with more favorable electrolyte balance

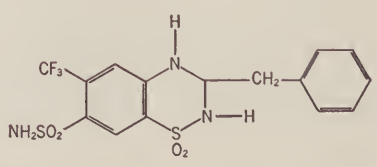
Other thiazides followed—with improvements being aimed at two particular areas: 1. attempts to increase diuretic action in relation to the milligram potency of the drug, and 2. attempts at a more favorable sodium/potassium ratio in the urine, i.e., to decrease the excretion of potassium while maintaining the excretion of sodium.[12]

One of these, Naturetin, Squibb Bendroflumethiazide, has made advances on both these points. "By adding a 3-benzyl radical to hydroflumethiazide a rather dramatic reduction in dose range is accomplished. With this drug, effective sodium excretion is obtained with doses between 2.5 and 10 mg., which is a 200 to 1 ratio as compared to chlorothiazide..."[13]

Moreover, due probably to its virtual lack of carbonic anhydrase inhibition, Naturetin (bendroflumethiazide) has been shown to cause less potassium and bicarbonate loss and less alteration in urinary pH than either chlorothiazide or hydrochlorothiazide.

Naturetin is outstandingly effective not only in establishing, but also in maintaining, excretion of retained fluid in edematous patients. And its duration of action is sufficiently prolonged to allow a single daily administration in most patients. Naturetin is also an effective antihypertensive agent.

Contraindications: Severe renal impairment; previous hypersensitivity.



Warning: Ulcerative small bowel lesions have occurred with potassium-containing thiazide preparations or with enteric-coated potassium salts supplementally. Stop medication if abdominal pain, distension, nausea, vomiting, or G.I. bleeding occur.

Precautions: The dosage of ganglionic blocking agents, veratrum, or hydralazine when used concomitantly must be reduced by at least 50% to avoid orthostatic hypotension. Electrolyte disturbances are possible in cirrhotic or digitalized patients.

Side Effects: Bendroflumethiazide may cause increases in serum uric acid, unmask diabetes, increase glycemia and glycosuria in diabetic patients and may cause hypochloremic alkalosis, hypokalemia; cramps, pruritus, paresthesias, and rashes may occur.

Supplied: Naturetin (Squibb Bendroflumethiazide) 5 mg. and 2.5 mg. tablets. Also available Naturetin ĉ K [Squibb Bendroflumethiazide (5 or 2.5 mg.) with Potassium Chloride (50 mg.)]. For full information, see Product Brief.

Naturetin®
SQUIBB BENDROFLUMETHIAZIDE
to reduce excess fluid
or high blood pressure

Massive, worldwide clinical experience

Weight gain as infrequent as weight loss

New freedom from undesirable effects

New low cost

Contraindications—Mammary or genital carcinoma should be ruled out prior to administering Ovulen. Undiagnosed vaginal bleeding is also a contraindication to Ovulen use. A history of thrombophlebitis or pulmonary embolism, or both, is a contraindication to the use of Ovulen, unless its use is judged by the physician to be necessary despite the possible risk. Ovulen should not be used in women with suspected or overt liver dysfunction or disease. Ovulen is contraindicated in pregnant and nursing women and in patients with a history of cerebrovascular accident.

Warnings—Medication should be discontinued pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. Medication should be withdrawn if examination reveals papilledema or retinovascular lesions. Since the safety of Ovulen therapy in pregnancy has not yet been established, it is recommended that, in a patient who has missed two consecutive menstrual periods, pregnancy be ruled out before oral contraceptive therapy is continued.

Precautions—Because Ovulen may aggravate a tendency toward fluid retention in some patients, it should be administered cautiously to patients with a history of renal or cardiovascular disease (including hypertension), asthma, epilepsy or migraine. Any possible influence of long-term Ovulen therapy on pituitary, adrenal cortical, ovarian, hepatic or uterine functions requires further study. Oral contraceptives also should be administered cautiously to diabetic patients since a decrease in glucose tolerance has been observed in some patients taking these drugs. Patients on Ovulen may occasionally show abnormal glucose tolerance tests, but this does not necessarily indicate the presence of diabetes. Significant increases in platelet count, prothrombin and proconvertin tests, plasma thrombotic activity and plasma proteolytic activity have been reported.

Since estrogens may affect results of serum protein bound iodine and other thyroid function tests, these tests should not be considered definitive until Ovulen therapy has been discontinued for at least sixty days. Adrenal steroid serum levels and excretion may be affected by estrogens; the Metopirone® (SU-4885) test of pituitary-adrenal function may also be depressed. Abnormalities in hepatic function tests have also been reported, including some interference with dye excretion by the liver. This interference may give rise to Bromsulphalein® retention and jaundice in susceptible individuals. Serious liver dysfunction should be ruled out before continuing Ovulen administration when abnormalities in liver function tests occur.

Patients with a history of psychic depression should be observed carefully during treatment with oral contraceptives, and such treatment should be discontinued if depression recurs to a serious degree. Pre-existing fibroids may increase in size during Ovulen therapy. Such fibroids may regress to pretreatment size after Ovulen is stopped. In the event of breakthrough bleeding the possibility of nonfunctional causes should be borne in mind. Additional means of contraception should be used during the first seven days of Ovulen administration in the first treated cycle, because early ovulation may possibly occur.

Side Actions—The following adverse reactions have been reported with Ovulen; however, a causal relationship to Ovulen administration has not been established in all of the listed complaints: headache, dizziness, depression, breast complaints, amenorrhea, chloasma, vomiting, allergy, edema, migraine, pulmonary embolism, thrombophlebitis, visual difficulties, nervousness, rash, itching, decrease in libido, tiredness, malaise, hair loss and hair growth. A small incidence of nausea, spotting and breakthrough bleeding has been reported; these complaints tend to diminish markedly or disappear after the first cycle of treatment. Some of these side actions have required discontinuance of the drug.

Dosage—One tablet daily for 20 consecutive days beginning 5 days after the onset of menstruation.

Before prescribing see Detailed Product Information, Ovulen.

An extensive list of references on Ovulen is included in the literature mailed to physicians.

SEARLE

Ovulen®

1 mg. Each tablet contains:
ethynodiol diacetate 1 mg.
mestranol 0.1 mg.

There is no more effective contraceptive available

why wonder about a drug

when you know

DECLOMYCIN®
DEMETHYLCHLORTETRACYCLINE
is effective b.i.d.

It's made for b.i.d.

ffective in a wide range of everyday infections — respira-ory, urinary tract and others — in the young and aged — ie acutely or chronically ill — when the offending organ-ms are tetracycline-sensitive.

ontraindication — History of hypersensitivity to demethyl-hlortetracycline.

Warning — In renal impairment, usual doses may lead to xcessive systemic accumulation and liver toxicity. Under uch conditions, lower than usual doses are indicated nd, if therapy is prolonged, serum level determinations ay be advisable. A photodynamic reaction to natural or rtificial sunlight has been observed. Small amounts of rug and short exposure may produce an exaggerated unburn reaction which may range from erythema to evere skin manifestations. In a smaller proportion, pho-oallergic reactions have been reported. Patients should void direct exposure to sunlight and discontinue drug at he first evidence of skin discomfort.

Precautions and Side Effects — Overgrowth of nonsuscep-ible organisms may occur. Constant observation is essential. If new infections appear, appropriate measures should be taken. Use of demethylchlortetracycline during tooth development (last trimester of pregnancy, neonatal period and early childhood) may cause discoloration of the teeth (yellow-grey-brownish). This effect occurs mostly during long-term use but has also been observed in short treatment courses. In infants, increased intracranial pressure with bulging fontanels has been observed. All signs and symptoms have disappeared rapidly upon cessation of treatment. Side reactions include glossitis, stomatitis, proctitis, nausea, diarrhea, vaginitis and dermatitis. If adverse reaction or idiosyncrasy occurs, discontinue medication and institute appropriate therapy. Anaphylactoid reactions have been reported.

Average Adult Daily Dosage: 150 mg q.i.d. or 300 mg b.i.d. Should be given 1 hour before or 2 hours after meals, since absorption is impaired by the concomitant administration of high calcium content drugs, foods and some dairy products.

Capsules: 150 mg; *Tablets:* film coated, 300 mg, 150 mg, and 75 mg of demethylchlortetracycline HCl.

Everyone says she's a barrel of fun

But what does she think?

Many overweight patients can benefit from the appetite control provided by the sustained anorexigenic-tranquilizing action of BAMADEX SEQUELS: anorexigenic action of amphetamine; tranquilizing action of meprobamate; prolonged action through sustained release of active ingredients.

Bamadex® Sequels®

DEXTRO-AMPHETAMINE SULFATE (15 mg.) WITH MEPROBAMATE (300 mg.) SUSTAINED RELEASE CAPSULES

to help establish a new dietary pattern

Contraindications: Dextro-omphetamine sulfate: in hyperexcitability and in agitated prepsychotic states. Previous allergic or idiosyncratic reactions to meprobamate.

Precautions: Use with caution in patients hypersensitive to sympathomimetic compounds, who have coronary or cardiovascular disease, or are severely hypertensive.

Dextro-amphetamine sulfate: Excessive use by unstable individuals may result in psychological dependence.

Meprobamate: Careful supervision of dose and amounts prescribed is advised, especially for patients with known propensity for taking excessive quantities of drugs. Excessive and prolonged use in susceptible persons, e.g. alcoholics, former addicts, and other severe psychoneurotics, has been reported to result in dependence on the drug. Where excessive dosage has continued for weeks or months, reduce dosage gradually. Sudden withdrawal may precipitate recurrence of preexisting symptoms such as anxiety, anorexia, or insomnia; or withdrawal reactions such as vomiting, ataxia, tremors, muscle twitching and, rarely, epileptiform seizures. Should meprobamate cause drowsiness or visual disturbances, reduce dosage and avoid operation of motor vehicles, machinery or other activity requiring alertness. Effects of excessive alcohol consumption may be increased by meprobamate. Appropriate caution is recommended with patients prone to excessive drinking. In patients prone to both petit and grand mal epilepsy meprobamate may precipitate grand mal attacks. Prescribe cautiously and in small quantities to patients with suicidal tendencies.

Side Effects: Overstimulation of the central nervous system, jitteriness and insomnia or drowsiness.

Dextro-amphetamine sulfate: Insomnia, excitability, and increased motor activity are common and ordinarily mild side effects. Confusion, anxiety, aggressiveness, increased libido, and hallucinations have also been observed, especially in mentally ill patients. Rebound fatigue and depression may follow central stimulation. Other effects may include dry mouth, anorexia, nausea, vomiting, diarrhea, and increased cardiovascular reactivity.

Meprobamate: Drowsiness may occur and can be associated with ataxia; the symptom can usually be controlled by decreasing the dose, or by concomitant administration of central stimulants. Allergic or idiosyncratic reactions: maculopapular rash, acute nonthrombocytopenic purpura with petechiae, ecchymoses, peripheral edema and fever, transient leukopenia. A case of fatal bullous dermatitis, following administration of meprobamate and prednisolone, has been reported. Hypersensitivity has produced fever, fainting spells, angioneurotic edema, bronchial spasms, hypotensive crises (1 fatal case), anuria, stomatitis, proctitis (1 case), anaphylaxis, agranulocytosis and thrombocytopenic purpura, and a fatal instance of aplastic anemia, but only when other drugs known to elicit these conditions were given concomitantly. Fast EEG activity, usually after excessive dosage. Impairment of visual accommodation. Massive overdosage may produce drowsiness lethargy, stupor, ataxia, coma, shock, vasomotor and respiratory collapse.

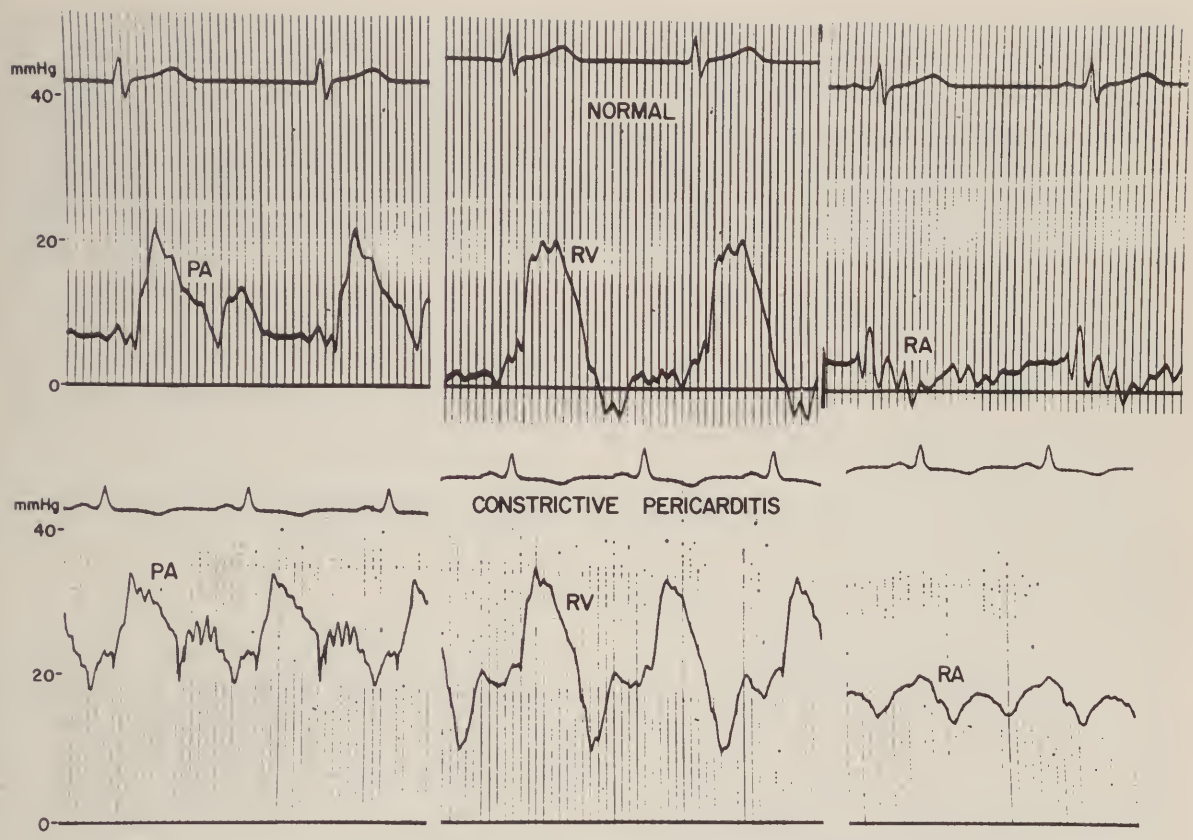
CONSTRICTIVE PERICARDITIS

C. RICHARD CONTI, MD
Fellow in Medicine
The Johns Hopkins University School of Medicine

GOTTLIEB C. FRIESINGER, MD
Assistant Professor of Medicine
The Johns Hopkins University School of Medicine

Constrictive pericarditis is an uncommon disorder and frequently difficult to diagnose. In the patient with a small quiet heart, high venous pressure, pulsus paradoxus, ascites, edema and calcium in the pericardium, constrictive pericarditis is easily diagnosed. In our experience, however, this textbook description of constrictive pericarditis is rarely encountered.

Because the disease results in considerable disability and mortality, and because surgical therapy is effective, it is important to establish the diagnosis, but despite the presence of good clues, it is easily overlooked.



The jugular venous pressure is raised in constrictive pericarditis because diastolic filling of the ventricle is hampered. Elevated venous pressure is, therefore, the most consistent physical finding in constrictive pericarditis. The pathologic anatomy of constrictive pericarditis adequately explains these physiologic derangements, ie, fibrous tissue encases the heart and limits diastolic expansion of the ventricles resulting in an inadequate cardiac filling at a markedly elevated filling pressure. The ventricular pressure pulse characteristically exhibits an initial early diastolic dip followed by a plateau throughout the remainder of diastole (see Figure).

On auscultation, an early protodiastolic sound, known as a pericardial knock, is frequently heard in constrictive pericarditis. This sound is produced by the abrupt halt in filling, early in diastole, and coincides with the sudden upswing of the ventricular pressure to its diastolic plateau (see Figure).

Problems in diagnosis arise for the following reasons: (1) the diagnosis is not considered, (2) primary manifestations of constrictive pericarditis are obscured by secondary symptoms and physical findings simulating other diseases, and (3) the presence of other cardiac disease may obscure the fact that constrictive pericarditis is also present. The following case summaries will serve to illustrate some of the pitfalls one encounters with constrictive pericarditis.

1. Diagnosis not considered

A 31-year-old physician's wife was seen with a seven-month history of ascites and ankle edema. She had consulted several physicians and had received a variety of treatments prior to her admission to the hospital for evaluation. On the admission examination, she had ascites, hepatomegaly and edema. In addition, venous pressure was elevated and an apical third heart sound

Intravascular pressure tracings in a normal patient (upper) and a patient with constrictive pericarditis (lower).

The lower tracings demonstrate the inability of the ventricle to expand properly; the ventricles are filled to their limit very quickly (diastolic dip), resulting in a rapid rise of the ventricular pressure (diastolic plateau), which in turn elevates the atrial and venous pressures.

was present. The differential diagnosis during the early portion of the examination included inferior vena caval obstruction, primary liver disease, hypothyroidism, chronic renal disease, intra-abdominal neoplasm with lymph node compression and lymphoma. Initially cardiac disease was not considered. Persistence of elevated venous pressure following diuresis prompted strong consideration of constrictive pericarditis. Successful pericardiectomy was performed.

This patient demonstrates the fact that a wide variety of diseases may be confused with constrictive pericarditis, despite the fact that all facets of the clinical history are well explained by the presence of constriction.

2. Primary manifestations of constriction obscured by secondary symptoms and physical findings

A 27-year-old Lebanese bank clerk was felt to have had acute rheumatic fever and was considered for a twelve-year period to have rheumatic heart disease. During the three years prior to admission, he developed congestive heart failure and obtained only partial relief with usual therapeutic measures. At the time of admission to our hospital, he presented as quite an obese man with atrial fibrillation, elevated jugular venous pressure and an early diastolic adventitious sound, hepatomegaly and ankle edema. It was felt his atrial fibrillation and early diastolic sound (the pericardial knock) were explicable on the basis of constrictive pericarditis and that no valvular disease was present. At catheterization, this proved to be correct and he successfully underwent pericardiectomy. Repeat catheterization one year following pericardiectomy revealed some restrictive abnormalities of the heart although he was markedly improved.

This patient demonstrates the confusion that can arise on the basis of the physical findings. In this instance, the pericardial knock was felt to be

the opening snap of mitral stenosis and the atrial fibrillation was thought to be secondary to his rheumatic heart disease. A large percentage of individuals with constrictive pericarditis develop atrial fibrillation if the disease is untreated for a long period of time. This is due to the fact that the sinus node is directly involved by the pathology in the pericardium. In addition, myocardial atrophy, or at least some degree of myocardial dysfunction, may persist after successful pericardiectomy if the constriction has been present for a long period of time.

3. Other cardiac disease obscuring the presence of constrictive pericarditis

A 25-year-old male construction worker with a heart murmur from infancy was admitted to the hospital when he developed pneumonia and was found to have cardiomegaly and congestive failure. On physical examination, he had right ventricular hypertrophy and auscultatory findings of atrial septal defect. Hepatomegaly and ascites were also present. His congestive failure proved extremely refractory to all varieties of treatment. Cardiac catheterization confirmed the clinical suspicion that an atrial septal defect was present. In addition, there was marked elevation of diastolic pressures throughout the heart, a most uncommon hemodynamic finding for an atrial septal defect. Even after this catheterization, constrictive pericarditis was not considered to be present. Following a prolonged period of hospitilization and continuing congestive failure, however, a thoracotomy was undertaken, constriction was found to be present and, following relief of constriction, the patient has been totally asymptomatic despite the fact that the atrial septal defect persists.

This patient demonstrates the fact that the presence of other cardiac disease may make it extremely difficult to think of and diagnose constrictive pericarditis even though the constrictive pericarditis is presenting the major hemodynamic burden to proper cardiac function. There is no definite relationship between congenital heart disease such as atrial septal defect and constrictive pericarditis, but in this case the two were associated and the constriction was by far the most important insofar as clinical symptomatology is concerned.

* * * *

We have seen other patients presenting difficult diagnostic problems, (1) rheumatic heart disease with mitral stenosis and associated constrictive pericarditis, (2) constrictive pericarditis presenting as protein-losing enteropathy, and (3) localized constrictive pericarditis masquerading as pericardial tumor with tricuspid obstruction. In every instance, however, carefully considering the diagnosis of constrictive pericarditis in individuals who have elevated venous pressure without readily evident cause, greatly facilitates one's ability to establish the diagnosis promptly.

Constrictive pericarditis is a disease of multiple etiology and in review of eleven proven cases we have seen recently, we were able to establish an etiology in none of them. Tuberculosis was formerly a cause in 20% to 25% of the cases. Histoplasmosis and other varieties of granulomous diseases account for some cases of constriction. Trauma, probably viral pericarditis, and a variety of other etiologies may result in constriction after a long period following the original insult.

Pericardiectomy is an extremely effective treatment for constrictive pericarditis and with current surgical techniques carries a very low mortality. The key to successful surgical therapy is early intervention, prior to the time that secondary myocardial changes have occurred or before irreversible changes are present in the liver from longstanding severe venous congestion. Proper interpretation of cardiac findings, careful determination of venous pressure, and continued search until these findings are satisfactorily explained, will lead to the diagnosis of this uncommon but interesting and important disorder.

Sedation of Alcoholics with Non-depressing Compounds

JOSEPH THIMANN, MD
Medical Director
Washingtonian Hospital, Boston

It is a well-known fact that addictive (and that means also excessive) drinkers, when admitted to a hospital at the end of a drinking spree, suffer from marked tension, restlessness, apprehension, and feelings of guilt. For these reasons, they have a great need for sedatives, hypnotics and other tranquilizers, all depressants of the central nervous system.

Unfortunately, alcoholic beverages, especially in excessive amounts, are depressants of the central nervous system also. Thus, the medications desired by the patients are bound to increase the already existing depression of the central nervous system to a sometimes serious extent.

All this was the reason that, for many years, physicians dealing with acutely intoxicated patients have aimed at reducing their need for depressants by the use of various non-depressing therapeutics and procedures. Such an agent was a combination of a sympathetic and parasympathetic depressant, such as bellafoline-gynergen[1] combination, without any outright sedative drug. Another such therapeutic procedure in this line was a subshock dose of insulin[2] followed by glucose and thiamine.

More recently, another attempt was made to keep the depression of the central nervous system as moderate as possible by applying monosodium l-glutamate* without any other chemical compounds or, if necessary, combined with *moderate* amounts of hypnotics, sedatives or tranquilizers in withdrawal phase of acute alcoholism.

Material

The pharmaceutic material and its method of action have been described very adequately by H. Waelsh[3]: "L-Glutavite is a nutritive supplement and consists of a fine, yellowish granular powder containing the ingredients monosodium l-glutamate plus vitamins of the B group and iron.

"It is presumed that the glutamate, after absorption, appears in the blood stream as glutamic acid and that it is the main ingredient affecting cerebral metabolism. Its participation in the Krebs cycle and carbohydrate metabolism constitutes the main source of metabolic energy for nervous tissue. The vitamins plus iron may contribute toward correcting nutritional deficiencies that frequently are found in alcoholics. Extensive studies of glutamic acid-glutamine metabolism on brain physiology reveal the importance of these amino acids and their derivatives on the functioning of the nervous system."

(*continued*)

This article first appeared in the Special Report series of the North American Association of Alcoholism Programs, August 1966. Reprinted by permission.

*L-Glutavite (Crookes-Barnes Laboratories, Inc.)

Method of Study

This study encompassed 100 patients admitted in the state of acute intoxication. All 100 patients were white. Of these, 50 served as the experimental group, the other 50 as a control group. In the experimental group, there were 36 male and 14 female patients; the ages ranged from 24 to 72 years; 25 patients were first admissions, 25 were repeaters. The average length of hospitalization was seven days. Each patient received a teaspoonful of monosodium l-glutamate three times a day, admixed with tomato juice or soup.

Of the 50 experimental patients, one refused to take monosodium l-glutamate after a one-day application. Of the remaining 49 experimental patients, eight required no additional medication except dilantin and vitamins. Their response to monosodium l-glutamate alone was, both subjectively and objectively, very gratifying.

The remainder of 41 experimental patients required additional tranquilizers such as promazine, and hypnotics such as paraldehyde or veronal. In this group treated with a combination of monosodium l-glutamate, hypnotics and sedatives, three patients developed side effects (nausea and dizziness, rash, muscular spasms). In these three patients monosodium l-glutamate was discontinued. A total of 33 patients showed marked to complete recovery, nine patients showed moderate improvement. In one case, the patient's cardiac condition clouded the therapeutic effect; in another case, concurrent drug addiction made it difficult to judge the reduction of the alcoholic withdrawal symptoms.

In the control group, there were 36 male and 14 female patients. The ages ranged from 27 to 72 years; 18 patients were first admissions, 32 were repeaters. The average length of hospitalization was seven days. In the control group, medication consisted of promazine, diazepoxide, paraldehyde, veronal, dilantin and vitamins. Of these patients, 27 showed marked to complete recovery; 15 patients responded moderately to the medication; five patients showed mild or no alleviation of their withdrawal symptoms; three patients left the hospital after only three days of hospitalization.

One of these case histories will illustrate the favorable reaction to monosodium l-glutamate:

M.T., a 58-year-old widow, white, professional person, was admitted May 13, 1965. It was her second admission to the hospital, after a six-day spree of excessive drinking preceded by a feeling of loneliness. Patient appeared to be moderately intoxicated ("I am much more intoxicated than I look"). No gross impairment of gait and speech, however, was observed; patient displayed a marked state of tremors and anxiety. There was a history of poor food intake during the last three days prior to admission, and of poor sleep; no history of hallucinations, convulsive seizures or any psychosis. Patient was oriented in all three spheres and cooperative. Shortly after admission, the patient received seven grams monosodium l-glutamate t.i.d., dilantin and vitamin B; shortly thereafter, patient was offered a regular dinner, ate with reasonable appetite and kept it down. During the first night, the patient slept spasmodically, but with no tremors noted. From the second day on, the anxiety subsided steadily, food intake continued to be adequate, insomnia decreased gradually, no rash or any other side effect was observed. Seven days after admission, at the time of discharge, the patient showed a most adequate recovery with no evidence of any anxiety, tremors or insomnia.

Conclusions

Monosodium l-glutamate appears to be a useful drug in the management of the alcoholic patient. It shortened the duration of the treatment with paraldehyde and other sedatives and thus hastened the recovery.

The efficacy of the monosodium l-glutamate as a method of reducing or possibly eliminating the need for alcohol would be revealed in a future, more prolonged study if the application of this compound would be continued for a period of, at least, six months after the termination of the hospitalization, with regular check-ups on an outpatient basis.

LABORATORIES INC. PALO ALTO, CALIF

new small size

Synalar® 0.01%
(fluocinolone acetonide) **cream**
15 Gm.

for even greater economy in office or hospital practice

the superiority topical with the

Now you can prescribe as little or as much Synalar Cream 0.01% as is needed for a particular therapeutic problem in a size that permits the greatest economy for your patient. The new 15 Gm. tube, for example, is best suited for short-term therapy and for small sites. For more extensive body areas prescribe the 45 Gm. tube—a size that's also ideal for your treatment table. And the 120 Gm. jar is most economical for hospital use. Thus, with Synalar Cream 0.01%, you have the superiority of a modern topical corticosteroid shown to be more effective than 1% hydrocortisone[1-3] plus the economy that makes therapy practical for use in more dermatologic conditions, in long-term maintenance, with occlusive dressings in resistant cases, and in extensive area involvement.

Contraindications: Tuberculous, fungal, and most viral lesions of the skin (including herpes simplex, vaccinia, and varicella). Not for ophthalmic use. Contraindicated in individuals with a history of hypersensitivity to any of its components. **Precautions:** 1. *General*—Synalar Cream 0.01% is virtually nonsensitizing and nonirritating. Where severe local infection or systemic infection exists, the use of systemic antibiotics should be considered, based on susceptibility testing. While topical steroids have not been reported to have an adverse effect on pregnancy, the safety of their use on pregnant females has not absolutely been established. Therefore, they should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. 2. *Occlusive dressing method*—With occlusion of extensive areas, systemic absorption of the corticosteroid may occur, and suitable precautions should be taken. Occasional patients may show contact sensitivity to a particular dressing material or adhesive. Miliaria, folliculitis, or pyodermas have been seen infrequently with the use of this technique. The development of infection requires appropriate antibacterial therapy and discontinuation of the occlusive dressing method. Local atrophy and striae have been reported with protracted occlusive dressing therapy. While lesion relapses can be expected to occur in many psoriatic patients, remissions may persist for several weeks to several months in favorable cases. The patient whose psoriasis is in an active stage, with recent appearance of new lesions, may not be a good candidate and may show early relapse. Some plastic films may be flammable, and due care should be exercised in their use. Similarly, caution should be employed when such films are used on or left near children to avoid the possibility of accidental suffocation. **Side Effects**: Side effects are not ordinarily encountered with topically applied corticosteroids. As with all drugs, however, a few patients may react unfavorably to Synalar under certain conditions. **References:** 1. Cahn, M. M., and Levy, E. J.: J New Drugs 1:262 (Nov.-Dec.) 1961. 2. LABORATORIES INC., PALO ALTO, CALIF.

Norinyl® tablets
(norethindrone 2 mg. & mestranol 0.1 mg.)

for multiple contraceptive action that has produced a record of unexcelled effectiveness

inhibition of ovulation by means of 2 time-proved hormonal agents

production of a cervical mucus hostile to sperm motility and vitality

creation of an endometrium unreceptive to egg implantation

no unplanned pregnancies

Norinyl provides multiple action for maximum assurance of success. It does not depend on ovulation inhibition alone for contraceptive effectiveness. The mechanism of action of combined hormonal therapy results in ovulation inhibition reinforced by other protective mechanisms, including a hostile cervical mucus[1-13] and an acceleration of endometrial changes.[1-3,7-16] With Norinyl, no unplanned pregnancies have been reported to date when used as directed.

plus important supportive benefits that help her through those critical early months of oral contraception

low incidence of side effects

Low incidence of BTB and spotting, nausea and amenorrhea tends to minimize side effect problems and increases patient cooperation.

no confusion about dosage

An unbreakable "confusionproof" package makes it easy to adhere to prescribed dosage schedule: individually sealed tablets numbered from 1 through 20 *plus* monthly calendar record enables patient to double-check dosage intake by day and corresponding tablet number.

Contraindications: Thrombophlebitis or pulmonary embolism (current or past). Existing evidence does not support a causal relationship between use of Norinyl and development of thromboembolism. While a study which was conducted does not resolve definitively the possible etiologic relationship between progestational agents and intravascular clotting, it tends to confirm the findings of the Ad Hoc Advisory Committee appointed by the Food and Drug Administration to review this possibility. Cardiac, renal or hepatic dysfunction. Carcinoma of the breast or genital tract. Patients with a history of psychic depression should be carefully studied and the drug discontinued if depression recurs to marked degree. Patients with a history of cerebral vascular accident.

Warning: Discontinue medication pending examination if there is sudden partial or complete loss of vision, or if there is a sudden onset of proptosis, diplopia or migraine. If examination reveals papilledema or retinal vascular lesions, medication should be withdrawn.

Precautions: By May 1963, experience with norethindrone 2 mg.—mestranol 0.1 mg. had extended over 24 months. Through miscalculation, omission or error in taking the recommended dosage of Norinyl, pregnancy may result. If regular menses fail to appear and treatment schedule has not been adhered to, or if patient misses two menstrual periods, possibility of pregnancy should be resolved before resuming Norinyl. If pregnancy is established, Norinyl should be discontinued during period of gestation since virilization of the female fetus has been reported with oral use of progestational agents or estrogen. When lactation is desired, withhold Norinyl until nursing needs are established. Existing uterine fibroids may increase in size. In metabolic or endocrine disorders, careful clinical preevaluation is indicated. A few patients without evidence of hyperthyroidism had elevated serum protein-bound iodine levels, which in the light of present knowledge, does not necessarily imply hyperthyroidism. Protein-bound iodine increased following estrogen administration. Bromsulphalein retention has occurred in up to 25% of patients without evidence of hepatic dysfunction. Studies from 24-hour urine collections have shown an increase in aldosterone and 17-ketosteroids and decrease in 17-hydroxycorticoid levels. Thus, Norinyl should be discontinued prior to and during thyroid, liver or adrenal function tests. Because progestational agents may cause fluid retention, conditions such as epilepsy, migraine and asthma require careful observation. Thus far no deleterious effect on pituitary, ovarian or adrenal function has been noted; however, long-range possible effect on these and other organs must await more prolonged observation. Norinyl should be used with caution in patients with bone, renal or any disease involving calcium or phosphorus metabolism.

Side Effects: Intermenstrual bleeding; amenorrhea; symptoms resembling early pregnancy, such as nausea, breast engorgement or enlargement, chloasma and minor degree of fluid retention (if these should occur and patient has not strictly adhered to medication plan, she should be tested for pregnancy); weight gain; subjective complaints such as headache, dizziness, nervousness, irritability; in a few patients libido was increased. In a total of 3,090 patients, 2.2% discontinued medication because of nausea.

NOTE: See sections on contraindications and precautions for possible side effects on other organ systems.

Dosage and Administration: One Norinyl tablet orally for 20 days, commencing on day 5 through and including day 24 of the menstrual cycle. (Day 1 is the first day of menstrual bleeding.)

Availability: Dispensers of 20 and 60 tablets; bottles of 100.

Planting Seeds of Concern for Retarded

Doctors fighting public misunderstanding of mental retardation can now count on the help of some 700 high school, college, and graduate students throughout the country. The young men and women have just completed a summer of work with retardates in 49 institutions.

The 700 were selected from thousands of applicants to participate in a government program designed to interest the cream of American youth in the field of mental retardation as a career. Project SWEAT—Student Work Experience And Training—was launched this year by the Department of Health, Education, and Welfare with grants to participating institutions.

"The very least such a program can do is create a greater understanding of mental retardation in hundreds of communities from coast to coast," says Dr. Robert I. Jaslow of the Public Health Service. "This summer we had students getting that understanding firsthand, and they will be able to pass it along to others." Dr. Jaslow is chief of the Mental Retardation Branch of the PHS Division of Chronic Diseases.

Seen As Human Beings First

Results of the program in terms of student entry into the mental retardation field remain to be assessed. But the 700 for the most part saw their summer charges as human beings first and retardates second—as men and women, boys and girls, not as some mutated species to be hidden away from the national conscience.

"I was surprised at the sharpness of the youngsters," says University of Arizona coed Becky Gorrell, 18. She spent the summer with retarded children at the E. R. Johnstone Training and Research Center, Bordentown, N.J. "One day one of them asked me if I thought I could make it there," Becky recalls. "It took a few moments to realize I was being kidded."

Population of the 300-acre state-supported center along the Delaware below Trenton is 450 youths from 12 to 21 years of age.

The ten students at Johnstone were paid $1.38 to $1.88 an hour under a $12,000 grant that also covered other expenses incidental to their 8- to 12-week stay. Experience at the 49 participating institutions ranged from cottage and camp counseling to clinical and court commitment studies.

Dr. Joseph J. Parnicky, Johnstone superintendent, believes with Dr. Jaslow in the future of the project developed from a 1965 pilot program. "Even if some of the young people in SWEAT don't later become actively involved with mental retardation," Dr. Parnicky says, "we will receive indirect benefits from them and direct benefits from those who stick with it."

DEPARTMENT OF HEALTH
STATE OF MARYLAND
William J. Peeples, MD, MPH, Commissioner

Highlights

Speed Up Medical Assistance Payments

With the seven-week backlog of bills accumulated while official notification of Federal approval of the State's Title XIX plan was pending, action to speed up payments became imperative. Through an arrangement with the Comptroller's office, advance payment of 75% of estimated accounts receivable is now being made on receipt of the request form sent to providers of service.

First Home Health Aide Class Graduated

The first group of Home Health Aides in Maryland was recently graduated after a two-week training program under the direction of Anne Arundel County's health officer, J. Howard Beard, MD. The students were employed during their training period, and will work under the supervision of public health nurses.

With the increased emphasis on home health services under Medicare and Medical Assistance programs, it is hoped that similar training programs will be established in other areas as needed.

The American Medical Association in 1960 urged physicians to "participate in organized home care programs for any patient who can benefit . . . and to promote such programs in their communities."

Laboratory Certification Temporarily Suspended

Further steps in certification of independent laboratories have been temporarily suspended, following word received from the Division of Medical Care Administration of the Public Health Service that major revisions are contemplated in "Conditions for Coverage of Services of Independent Laboratories" set forth by the Social Security Administration. The agency, which gives professional guidance to the Social Security Administration, states that organized opposition to certain provisions has necessitated the reconsideration. Interim certification to independent clinical laboratories has been completed to a considerable extent, and arrangements for payments to these laboratories are progressing.

It is believed likely that independent radiological laboratory facilities will not be subject to Medicare conditions.

State School Health Council Reorganized

In the recent reorganization of the Maryland State School Health Council, this advisory body's Executive Board, formerly limited to Departments of Health and Education personnel, was expanded to include local health officers and representatives of the Medical and Chirurgical Faculty of the State of Maryland, the Maryland Chapter of the American Academy of Pediatrics, the State of Maryland Department of Mental Hygiene, the Maryland Association of School Superintendents, the Maryland State Association for Higher Education, the Maryland Congress of Parents and Teachers, the Maryland State Nurses Association, the Department of Education, Archdiocese of Baltimore, and the Private Schools Association

of Maryland. The Council itself consists of the Board and two representatives from each county and from Baltimore City, appointed by the local health officer and the local supervisor of schools.

The reorganized Council is expected to assume an active role in encouraging and helping to organize school health programs.

Three-Year Accreditation for Mt. Wilson

The accreditation of Mt. Wilson State Hospital by the Joint Commission on Accreditation of Hospitals for three years instead of the usual one reflects special credit not only upon the Chief of the Division of Respiratory Diseases and the Hospital Superintendent but also upon the entire hospital staff. Mt. Wilson's tradition of high-caliber service has been maintained in spite of personnel shortages and the need for adjusting to new demands and techniques.

Of the chronic disease-rehabilitation hospitals, Montebello passed its second inspection and is accredited for three years, Deer's Head passed its initial inspection and is accredited for one year, and Western Maryland is working toward accreditation.

The Department's voluntary participation in this program is part of its continuing effort to achieve excellence in its hospitals.

Behavioral Study of Tuberculosis Patients

The National Tuberculosis Association has selected Baltimore as one of three locations in the United States in which to conduct studies on the behavioral characteristics of tuberculosis patients. Other locations from which data will be obtained from representative samples of the population are St. Louis and San Francisco.

The behavioral study in Baltimore City is planned to last for a period of three years, and will be locally administered by a behavioral scientist from the Johns Hopkins School of Hygiene and Public Health, who will appoint his own staff to work in the city chest clinics alongside of the city staff. The preliminary work is already under way and the main part of the study will start at the beginning of next year.

This study is being financed in part by the National Tuberculosis Association. Substantial assistance has been received from the Maryland Tuberculosis Association and from the Tuberculosis Association of the State of Delaware specifically for the Baltimore City project. The City Health Department is providing accommodations and will cooperate with the Study personnel in any way possible.

It is our hope that the study will help us remove all barriers between patients and clinics, reduce the present significant extent of noncooperation by tuberculosis sufferers, and thus accelerate the decline of tuberculosis in the city.

The Mentally Retarded in Psychiatric Hospitals

Eight percent of the patient population in Maryland's psychiatric hospitals are classified as mentally retarded. These 621 compare with the 2,989 currently under treatment at Rosewood and Henryton, the Department's two hospitals for the mentally retarded. The following table shows their distribution by age and by length of hospitalization.

Length of Hospitalization	Total	Age (In Years) -15	15-24	25-34	35-44	45-54	55-64	65 and Over
Less than 1 year	81	7	28	17	14	7	4	4
1-4 years	110	1	22	28	25	13	15	6
5-9 years	41	—	4	10	15	6	6	—
10-19 years	135	—	3	24	39	26	24	19
20 years or more	254	—	—	11	30	58	84	71
Total	621	8	57	90	123	110	133	100
Median (years)	15.8	0.6	1.1	5.0	11.9	20+	20+	20+

The number of retarded patients in psychiatric hospitals has declined somewhat in recent years, mainly due to death and to the transfer of 15 to Henryton. As shown here, most have been under care for some time with a median continuous hospitalization in excess of 15 years. This is substantially higher than the comparable figure for all other patients. The number of discharged patients is small (an annual average of 138 during the last five years) and does not exceed the number of such new admissions. Releases have been mainly among recent admissions.

It should be recognized that mental disturbances in addition or related to retardation are quite common among those who are in psychiatric hospitals. They differ from the patients admitted to Rosewood in that most are adults who are classified as mentally retarded with psychosis. Also, they probably comprise a higher proportion of borderline retardates and a concomitant lower proportion of those below this level. Their relatively high median age on admission (29.5 years) indicates that hospitalization may have been caused by a change in the patient's condition or by death or other alteration in the family structure.

The psychiatric hospitals are acutely aware of

the long-term retarded patients since these form a substantial proportion of their chronic population. Further efforts to reduce the size of this group are dependent on:

1. Additional construction in existing or planned hospitals for the retarded.
2. Stringent efforts to see that those whose primary reason for hospitalization is retardation are not admitted to psychiatric hospitals.
3. Expansion and coordination of nursing homes and other community facilities and resources.
4. Programs to assist families in maintaining retardates in their own homes.
5. Development of community-based small residential homes for the mentally retarded.
6. Expansion of sheltered workshop resources in the community.

MARYLAND ASSOCIATION OF MEDICAL ASSISTANTS

MAMA GOES TO ST. LOUIS

Members of the Maryland Association of Medical Assistants attended the recent AAMA convention in St. Louis, and there had the opportunity to hear an address by Charles L. Hudson, MD, President of the American Medical Association. Delegates to the convention from Maryland were Helen Wehmeyer, Wicomico chapter; Joyce Anderson, Alleghany-Garrett chapter; and Dorothy Hartel, trustee to AAMA, Baltimore chapter.

Betty Fern, president of MAMA, and Mabel Young, of the Alleghany-Garrett chapter, were also in attendance at the convention.

The Maryland delegates were pleased to receive three trophies at the convention as awards for percentage increase in memberships.

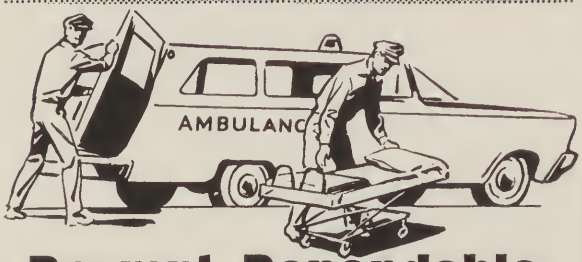
BALTIMORE CHAPTER HOLDS ELECTIONS

At the November meeting of the Baltimore Association of Medical Assistants, the following were elected for the 1967 term of office:

Eleanor Mainhardt, CMA,—president-elect
Dorothy Walker—vice-president
Arlene Whalen—secretary
William Leiby—treasurer

Past president-elect, Rita Cobry, will now begin her term as president of the association.

NEW ADVISOR APPOINTED TO BAMA



At the November meeting of the Baltimore Association of Medical Assistants, H. L. Wollenweber, MD, was elected to serve in an advisory position to the BAMA. John Littleton, MD who served as the organization's advisor for the past year with Edward Lewison, MD will continue as advisor with Dr. Wollenweber for the year.

H. L. Wollenweber, MD

MAMA MEMBER PASSES CERTIFICATION EXAMINATION

Eleanor Mainhardt, assistant to S. Elliott Harris, MD, recently passed the American Association of Medical Assistants' Certification Examination. This is quite an achievement for Eleanor since she is the first member of the Baltimore

Montgomery County Auxiliary Raises Funds with Fashions

A bit of Scandinavia's glittering white snow and shimmering ice-like silver found their place in fashions in the annual fund-raising event for the Woman's Auxiliary to the Montgomery County Medical Society, a luncheon-fashion show in the Regency Ballroom of the Shoreham Hotel in Washington, DC, on December 7. A "Winter Wonderland" of fashions was staged by Mrs. Elsie Benjamin, buyer of the designer fashions of La Boutique Saks, with Antoinette Sharkey as commentator. All proceeds will benefit Medical Allied Scholarships and Loan Programs.

The Scandinavian countries were featured and their Ambassadors' wives honored. Mrs. Consuelo Roenne, of Denmark, Madame Gunneng, of Norway, Mrs. Eva deBesche, of Sweden, and Mrs. Eila Munkki, of Finland, were among the guests to see fashions from their countries as well as fashions by other designers. One representative from each embassy modelled her own native costume.

Devron set the musical mood amid Scandinavian holiday decorations. Cherry-Herring miniatures were presented to each guest through the courtesy of Scandinavian Airlines. Frank Harden and Harden Weaver were Masters of Ceremonies.

Mrs. Andrew J. Brennan is president of the Auxiliary and Mrs. Francis C. Mayle was chairman of the luncheon-fashion show. Mrs. James A. Roberts and Mrs. Albert Grollman were in charge of reservations.

Committee chairmen included: Mrs. Solomon Barr, Mrs. Howard Bernstein, Mrs. M. McKendree Boyer, Mrs. Albert Grollman, Mrs. John L Lertora, Mrs. James A. Roberts, Mrs. Charles Saverese, Mrs. Joseph Schanno, Mrs. Robert Smith, Mrs. George R. Spence, Mrs. Robert F. Spicer, Mrs. John B. Umhau, Jr., and Mrs. Albert Zelna.

Collections Displayed

The Med-Chi Library has displayed collections of recent acquisitions at the semi-annual meeting of the faculty in Ocean City and at regular meetings of Cecil County Medical Society, Prince George's County Medical Society, and Harford County Medical Society. This contact helps to bring Library services closer to the users and acquaints physicians, particularly those new to Maryland, with the possibilities and ease of securing scientific information through the resources of the Faculty's Library.

Materials via MEDIC

Hospitals and other organizations with MEDIC hook-ups may call Med-Chi for library materials needed on a rush basis. The MEDIC receiver is in the administrative office, however, and in order to speak to the Librarian it is necessary to ask the person monitoring MEDIC calls to alert the Library that there is an incoming call. If enough such calls are received, a hand set will be placed in the Library for more efficient handling of requests.

Area Meeting

The District of Columbia-Maryland chapter of the Medical Library Association met in Baltimore on October 21 and 22, 1966, with Welch Medical Library, Johns Hopkins University, as host. Both Health Sciences Library, University of Maryland, and the Medical and Chirurgical Faculty Library assisted with arrangements and registration. At the Friday session of the regional meeting Dr. Carl Douglass, National Library of Medicine, announced that the regional library for this area, as prescribed by the new system of library networks, would include Virginia, West Virginia, District of Columbia and Maryland. Headquarters will be at the National Library of Medicine.

On Saturday, 120 medical librarians and library assistants participated in continuing education courses in "New Reference Tools" and "Human Factors in Library Administration." This was the largest group to register for these courses in any regional meeting to date.

DO YOU HAVE A
SCIENTIFIC EXHIBIT
YOU WOULD LIKE TO DISPLAY AT THE 1967 ANNUAL MEETING
of the
MEDICAL AND CHIRURGICAL FACULTY?

The Medical and Chirurgical Faculty, in cooperation with Mead Johnson Laboratories, will present an Aesculapius Award to the author of the most outstanding scientific exhibit shown at the 1967 Annual Meeting. The Committee on Program and Arrangements of the Medical Faculty will judge the exhibit. The winner will be presented with a certificate, suitably inscribed with the title of the exhibit and the author's name, and will receive a $200.00 cash prize donated by Mead Johnson Laboratories. Presentation will be made during the convention.

All scientific exhibits accepted for showing at the 1967 Annual Meeting will be eligible for judging. As space in the exhibit hall is limited, applications should be sent promptly. Physicians interested should contact the chairman, Committee on Program and Arrangements, Medical and Chirurgical Faculty, 1211 Cathedral Street, Baltimore, Maryland 21201.

ANNUAL MEETING
APRIL 19, 20, 21, 1967

Book Reviews

COMPREHENSIVE APPROACH TO THERAPY OF PAIN, by A. Lewis Kolodny, MD, and Patrick T. McLoughlin, MD. Charles C. Thomas Publisher, Springfield, Ill, 1966, 144 pp. $6.50.

This book should prove of value to any physician called upon to treat pain of any type or degree, but its greatest use will be for those who must treat chronic pain. Emphasis is placed on the fact that the psyche as well as the soma must be treated.

The book opens with "The Historical Aspects of Pain Therapy," followed by a brief outline of the anatomical pathways of pain.

There is a very interesting chapter on the "Development of an Analgesic Drug" in which is discussed the production of new analgesic agents by manipulation of known analgetics and routine screening of newly synthesized chemicals to detect analgesic characteristics. The many steps involved before the agent can be safely used are described.

Following this is a discussion of drug addiction and the many problems involved in treating it.

Several chapters are devoted to drugs: non-narcotic analgesic agents, narcotic analgesic drugs, and analgesic adjuncts. A description of each drug gives both the generic and the trade name, along with mode of action, dosage and side effects.

In one valuable chapter, "Misuse of Analgesic Agents," the authors caution against the too frequent routine use of these drugs with a complete disregard for individual patient variability.

The reader is advised to consider "learning well the pharmacology of a few agents and prescribing these whenever possible," and completely studying all available data concerning new drugs before using them.

This book is well worth reading.

Frank J. Brady, MD

PRIMER ON PREMATURITY AND HIGH-RISK PREGNANCY, by S. Borham Babson, MD, and Ralph C. Benson, MD. The C. V. Mosby Co., St. Louis, 1966, 170 pp. $10.50.

From the preface one learns that this book is designed for the "busy practitioner, house officer, and nurse . . . who care(s) for the high-risk pregnant mother and premature infant. . . ., (but is) at a loss for concise and easily available information regarding these patients."

Prematurity and low birth weight are first defined and their epidemiology considered. The conditions commonly associated with prematurity are then discussed in some detail: rubella, syphilis, multiple pregnancy, placenta praevia, incompetent cervix, thyroid disease, to name a few.

Considered separately are obstetric situations in which delivery is sought as treatment despite lack of fetal maturity: premature ruptured membranes, toxemia abruptio placenta, iso-immunization problems, and diabetes. The hazards of elective induction of labor and scheduled repeat sections are pointed out.

The second half of the book is primarily devoted to the care of this high-risk infant, if delivery is unavoidable. Methods of resuscitation and care of the infant at birth are outlined. Detailed instructions on nursery management follow, with special consideration of infections in the premature. The many and varied anomalies and physiologic handicaps of the premature are surveyed. Some general statements of their long term prognosis conclude the book.

From the obstetric point of view, prematurity is so commonly associated with almost every pathologic situation, that to be completely comprehensive the treatise would have grown to the size of a standard obstetric text. For this reason, the authors are selective, but they have given most consideration to the common entities.

In most specialties there is a fund of knowledge that is written and another that is verbally transmitted, usually in the resident-attending relationship. It is rare to see such 'oral tradition' spelled out in such detail as in this book. The authors have been careful to give majority opinions in this oral tradition, with only a few exceptions.

The authors have achieved their primary goal of providing a reasonable survey of prematurity and its management. This book will probably find its greatest audience among those physicians working in communities without full specialty coverage, where the care of such infants necessarily falls to the less experienced.

The chapters on nursery management should be of help to all nursing staff, regardless of the size of the unit.

PL 2-2122

Well, Doctor, it's sort of
a cross between a smoker's hack and a seal's bark.

It's a wise mother who realizes there may be more to her child's cough than meets the ear —and brings the youngster to you promptly for diagnosis and treatment.
If the cough is the useless, exhausting type that often accompanies respiratory infection or allergy, you can provide prompt relief with Novahistine DH. Its decongestant-antitussive action controls frequency and intensity of cough spasms without abolishing cough reflex. And the fresh grape flavor of Novahistine DH appeals to children and adults alike.
When your diagnosis is bronchitis, complicated by thick tenacious exudates, Novahistine Expectorant is particularly useful. It not only provides decongestive action and controls the cough, but also encourages expectoration, thus easing bronchial constriction and obstruction.
Use with caution in patients with severe hypertension, diabetes mellitus, hyperthyroidism or urinary retention. Ambulatory patients should be advised that drowsiness may result. Continuous dosage over an extended period is contraindicated since codeine phosphate may cause addiction.
Each 5 ml. teaspoonful of Novahistine DH contains codeine phosphate, 10 mg. (Warning: may be habit forming); phenylephrine hydrochloride, 10 mg.; chlorpheniramine maleate, 2 mg.; chloroform (approx.), 13.5 mg.; l-menthol, 1 mg. (Alcohol 5%). Each 5 ml. of Novahistine Expectorant contains the above ingredients and, in addition, glyceryl guaiacolate, 100 mg.

5 basic uro-analytical facts in 30 seconds

Labstix®

BRAND REAGENT STRIPS

...broadest urine screening possible from a single reagent strip

Urine test results with LABSTIX Reagent Strips can represent significant guides to differential diagnosis or therapy in many conditions. An unexpected "positive" may enable you to detect hidden pathology—long before more recognizable symptoms become evident. Negative results, which permit you to rule out abnormalities in a broad clinical range, can serve as baseline values for reference in future examinations. The 5 colorimetric test areas encompassed on LABSTIX Reagent Strips are:

pH—values are read numerically in the essential range of pH 5 to pH 9.

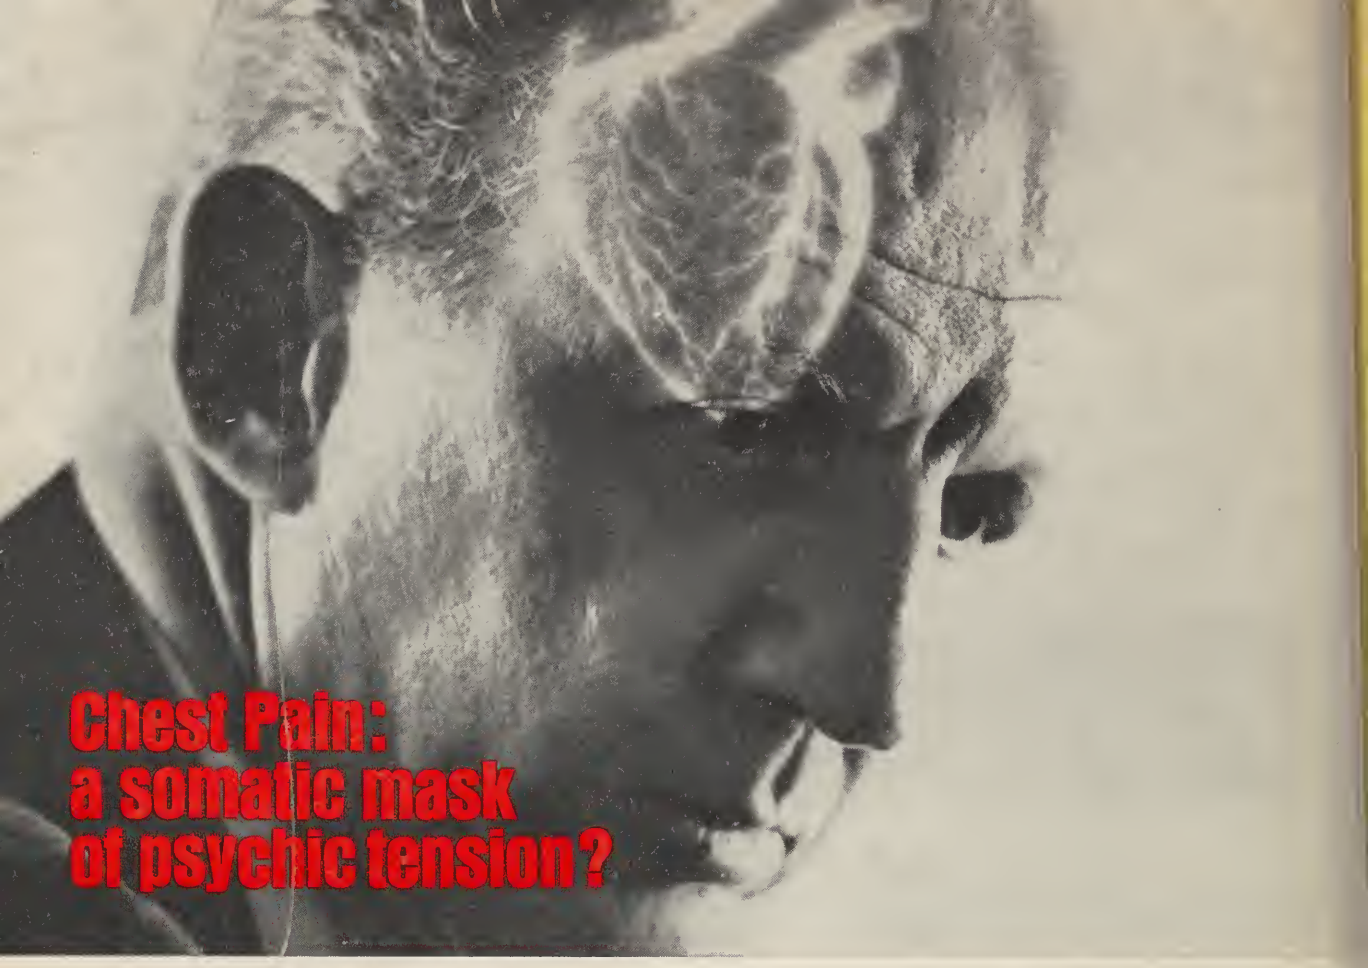
Protein—results are read either in the "plus" system or in mg. % in amounts approximating "trace," 30, 100, 300, and over 1000 mg. %.

Glucose—provides a "Yes-or-No" answer for urine "sugar spill."

Ketones—detects ketone bodies in urine—**both** acetoacetic acid and acetone. Reacts with as little as 5 to 10 mg. % of acetoacetic acid.

Occult Blood—specific test for intact red cells, hemoglobin or myoglobin. Results are read as negative, small, moderate or large amounts.

Now a Clear Reagent Strip of Firm Construction



...facilitates handling during testing procedure. Excellent color contrast made possible by the clear plastic strip, together with the clearly defined color charts provided, permits precise, reproducible colorimetric readings in all 5 test areas. A more definitive interpretation of uro-analytical facts is made possible.

Available: LABSTIX Reagent Strips, bottles of 100 (color charts are supplied with each bottle).

Ames Company, Inc., Elkhart, Indiana

AMES

08165

"Heart symptoms"—chest pain, tachycardia, arrhythmia—invariably alarm and preoccupy the patient, though they may be completely without organic basis. Such symptoms often are somatic masks of psychic tension, arising from constant encounters with stressful situations.

When the problem is diagnosed as emotionally produced, consider Valium (diazepam) as adjunctive therapy. Valium (diazepam) acts rapidly to calm the patient, to reduce his psychic tension and relieve associated cardiovascular complaints.

NEUROTIC FATIGUE—the chronic tiredness resulting from emotional strain which so often accompanies psychogenic "heart" symptoms—also can be alleviated by this highly useful agent. Valium (diazepam) often achieves results where other psychotherapeutic agents have failed.

Valium (diazepam) is generally well tolerated, and usually does not impair mental acuity or ability to function. If side effects such as ataxia and drowsiness occur, they usually disappear with dosage adjustment.

Contraindications: Infants, patients with history of convulsive disorders or glaucoma.

Warning: Not of value in the treatment of psychotic patients, and should not be employed in lieu of appropriate treatment.

Precautions: Limit dosage to smallest effective amount in elderly patients (not more than 1 mg, one or two times daily) to preclude ataxia or oversedation. Advise patients against possibly hazardous procedures until correct maintenance dosage is established; driving during therapy not recommended. In general, concurrent use with other psychotropic agents is not recommended. Warn patients of possible combined effects with alcohol. Safe use in pregnancy not established. Observe usual precautions in impaired renal or hepatic function and in patients who may be suicidal; periodic blood counts and liver function tests advisable in long-term use. Cease therapy gradually.

Side Effects: Side effects (usually dose-related) are fatigue, drowsiness and ataxia. Also reported: mild nausea, dizziness, blurred vision, diplopia, headache, incontinence, slurred speech, tremor and skin rash; paradoxical reactions (excitement, depression, stimulation, sleep disturbances and hallucinations) and changes in EEG patterns. Abrupt cessation after prolonged overdosage may produce withdrawal symptoms similar to those seen with barbiturates, meprobamate and chlordiazepoxide HCl.

Dosage — Adults: Mild to moderate psychoneurotic reactions, 2 to 5 mg b.i.d. or t.i.d.; severe psychoneurotic reactions, 5 to 10 mg t.i.d. or q.i.d.; alcoholism, 10 mg t.i.d. or q.i.d. in first 24 hrs, then 5 mg t.i.d. or q.i.d. as needed; muscle spasm with cerebral palsy or athetosis, 2 to 10 mg t.i.d. or q.i.d. Geriatric patients: 1 or 2 mg/day initially, increase gradually as needed.

Supplied: Tablets, 2 mg, 5 mg and 10 mg; bottles of 50 for convenience and economy in prescribing.

Gastrointestinal Tract
AQUINO, FQ, JR; Cocco, AE; Achalasia: present concepts and three cases (Dec) 75-81
FISCHER, RA: Management of inflammation of upper gastrointestinal tract (Oct) 62-76
MECH, KF: Surgical considerations in gastrointestinal bleeding (Sept) 29-32
MONIAS, MB: Standardized senna concentrate in postpartum bowel rehabilitation (Feb) 32

General Practice
HIMMELWRIGHT, GO: (MARYLAND ACADEMY OF GENERAL PRACTICE): History and objectives of the AAGP (Sept) 131-132

Genetics
TAUBERT, HD; Moszkowski, EF; Saunders, OH: Trisomy 17-18: The clinical scope of a chromosomal aberration (June) 48-55

Geriatrics/Gerontology
HERSPERGER, WG: The bonus years (Aug) 49-54

Glaucoma—see Eyes

Growth Failure—see Pediatrics

Gynecology
FRIEDEL, HJ: Candicidin: A new vaginal monolicide (Feb) 36-37

Handicapped
GAINES, ML, JR; Mauchline, D; Nadolsky, J; Miller, A; George, G: Vocational evaluation of handicapped (May) 114-126

Health Services
FARBER, RE: (BALTIMORE CITY HEALTH DEPARTMENT)
Alcoholism program (May) 151
Behavioral study of TB patients (Dec) 129
1965 Birth certificates show encouraging trend in prenatal care (Nov) 153
Dental health in Baltimore (Apr) 117
Highlights of sanitary services for 1965 (Mar) 113-114
Midyear analysis (Sept) 141-142
New ambulance regulations (Aug) 110-112
New comprehensive health services for children and youth (Oct) 125-127
New immunization-birth record card (Jan) 123-124
Rabies control (July) 153
Suicide study (Feb) 92
Tuberculosis tests for school personnel (June) 147
VD darkfield examination service (Feb) 92

PEEPLES, WJ: (STATE OF MARYLAND DEPARTMENT OF HEALTH) Highlights

(Jan) 121-122
(Feb) 88-90
(Mar) 115-116
(Apr) 112-114
(May) 147-148
(June) 142-145
(July) 149-150
(Aug) 106-108
(Sept) 137-138
(Oct) 121-123
(Nov) 151-152
(Dec) 127-128

Revised regulations relating to communicable diseases (Jan) 92

Heart Disease
ALTLAND, NR; Weitzman, E: Personality differentiation of patients with coronary artery disease (June) 63-65
BIX, HH: Aberrant conduction during auricular fibrillaiton (Nov) 133-136
CARROLL, D: Exercise tests in heart disease (Dec) 105-109
Exercise and coronary artery disease (Nov) 145-147
CLIFFORD, JL: Evaluation of the hypertensive patient (Apr) 81-82
CONTI, CR; Friesinger, G: Constrictive pericarditis (Dec) 116-118
DEMBO, DH: Post-resuscitation care after cardiac arrest (Jan) 103
ELIAS, EG; Finney, W: Arrhythmias secondary to craniocerebral trauma (Sept) 75-88
MARKOWITZ, M; Neill, CA: Physical activities for school children with heart disease (Apr) 104-108
MC LAUGHLIN, JS; Mansberger, A; Cowley, RA; Myocardial failure secondary to shock (Aug) 83-85
NICHOLS, J: Vocational rehabilitation of cardiac patient (Mar) 93-94
VOIGT, GC: Lewis, KB: Idiopathic myocardiopathy, Part I: Clinical features (June) 123-124
Idiopathic myocardiopathy, Part II: Treatment and the role of long term bed rest (July) 131-132
WEAVER, KN: EKG in infants and children (May) 129-130

Homicides
NORTON, SM; Smith, RT: Homicides in Baltimore (Sept.) 52-66

Hypertension (see also Pathology)
RUSSELL, RP: Treatment of hypertensive states (June) 23-27

Hypnosis
CONN, JH: Medical hypnosis (Aug) 43-46

Immunizations—see Pediatrics

Infections, Neonatal—see Pediatrics

Intensive Care Units
MILLER, JH; Peters, JJ; Devese, IM: Basic considerations in the construction of an intensive care unit (Nov) 72-75

Jaundice, Neonatal—see Pediatrics

Joints (see Bones and Joints)

Journal, Maryland State Medical
Journal changes editors (Oct) 23-24

Library, Medical and Chirurgical Faculty
Visits to County Society meetings (Jan) 129-130
Interlibrary loan service (Feb) 107-109
Changes in the library (May) 157-158
Recent accessions (June) 153
Recent accessions (Aug) 125-126
Recent accessions (Dec) 138-140

Lymph Node Biopsy—see Pathology

Maternal Welfare
Cases 8 and 9—Anesthesia accidents (Jan) 119-120
Case 10—Post-cesarean section death (Feb) 77
Case 11—Postpartum hemorrhage (Apr) 100-102
Case 12—Cause of death undetermined (May) 135
Case 13—Rupture of uterus (June) 135-136

Measles
Measles vaccine in prevention of mental retardation (Oct) 109

(July) 157-158
(Aug) 121-122
(Sept) 157-158
(Nov) 163-164
(Dec) 133-134

Medicolegal Problems
FARINHOLT, LW, JR; O'Donnell, WJ: Power of the state to impose medical treatment (June) 73-98
SOLTER, GD; Israelson, MR: Legal solutions to problems in daily medical practice (May) 61-78
WHITRIDGE, J, JR; Coleman, RC: Medical and legal aspects of human sterilization (Nov) 61-69

Mental Health
GORWITZ, K: (STATE OF MARYLAND DEPARTMENT OF MENTAL HYGIENE)
Alcoholic patient (Oct) 131-133
Demography of mental illness in Maryland (Nov) 40-49
Employee-Patient ratios (June) 149
Fact sheet for 1966 fiscal year (Sept) 145-146

Mental health of the negro (Apr) 119
Mentally retarded in psychiatric hospitals (Dec) 131-132
Midyear report (Mar) 117
National scene (May) 153
Patient mortality (Jan) 125-126
Patterns of retention, release and rehospitalization (Feb) 96-98
Psychiatric care: changing patterns in Maryland (Dec) 58-68
Report to 15 southern states (July) 155
Schizophrenic patient (Nov) 157-158
Suicide (Aug) 114-119
Trends of the mental hospital population of the US with special emphasis on Maryland (June) 67-69

Mental Retardation—see Retardation

Nursing
BRANTIGAN, OC: Clinical nursing (May) 51-57

Nursing Homes
CARROLL, D: Medical care in a Baltimore nursing home (Feb) 63-66

Obesity
ANDERSON, IR; Berman, MJ: Eating patterns of obesity (Apr) 60-61

Pathology (MARYLAND SOCIETY OF PATHOLOGISTS, INC.)
ADAMS, JE: Curriculum needed in medical technology (May) 112
ADAMS, JE: Pathologists, hospitals and society: a pathologist's plea for necessary autonomy (Nov) 115-116
Automated clinical laboratory (Aug) 79-80
BREITENECKER, R: Some of us will sweat for it (July) 127-128
GUERIN, PF: Ethical and legal aspects of clinical pathology laboratories (June) 119-120
KING, WB, JR: Amniocentesis in erythroblastosis fetalis (Sept) 115-117
Post-mortem examination (Mar) 88-90
PETTY, CS: Medicine—the outward look from within a specialty (Apr) 77
RASMUSSEN, P: Genetics of essential hypertension (Jan) 99-100
WINSLOW, DJ: Lymph node biopsy in infectious diseases (Feb) 55-58

Pediatrics (MARYLAND CHAPTER, AMERICAN ACADEMY OF PEDIATRICS)
BESSMAN, SP: PKU Laws, model for the future? (July) 145-146
CLEMMENS, RL: Syndromes of minimal brain dysfunction in children (May) 139-140
Edgar Allan Poe school (Sept) 121
GOOD, TA; Bessman, SP: Anabolic sex-related steroids in cystic fibrosis (Aug) 100-104
GORTEN, MK: Neonatal jaundice (Feb) 80-81
GROSSMAN, MS: Growth failure (Nov) 123-125
Immunization schedule (Aug) 21-22
KLEIN, SW: Preventable neonatal infections (Jan) 117
MARKOWITZ, M; Neill, CA: Physical activities for school children with heart disease (Apr) 104-108
Maryland Poison control information center (Mar) 109
WEAVER, KH: Diagnosis and treatment of streptococcal pharynigitis (June) 139-140
ZIAI, M: Antimicrobials (Dec) 103-104

Pharyngitis, Streptococcal—see Pediatrics

Physicians
REESE, JM: Presidential editorial (Physician, heal thyself) (May) 13-14

PKU Laws—see Pediatrics

Poe, Edgar Allan, School—see Pediatrics

Poison Control—see Pediatrics

Post-mortem Examination—see Pathology

Preceptorships
ENTWISLE, G: Preceptorships and the practice of medicine (Dec) 45-52

Prostatitis
BORWELL, P: Prostatitis (May) 45-47

Psychiatry
GORWITZ, K: Psychiatric care: Changing patterns in Maryland (Dec) 58-68
MANNINO, FV; Wylie, HW: Use of the physical examination in a psychiatric clinic (Apr) 50-52
RAPPEPORT, JR: Sex in marriage counseling (Sept) 35-40

Psychology
KLEE, GD: Psychological factors in drug administration (June) 59-61

Quackery
Crusaders against quackery (Jan) 15

Radiology (MARYLAND RADIOLOGICAL SOCIETY)
DENNIS, JM: Radiology for the medical student (Mar) 101-103
LIGHT, JP: Chronic bronchitis (Jan) 109-111
MARGULIES, SI; Brogdon, BG: Hyperplastic cholecystoses (July) 139-143
MORRISH, HF: Radiographic diagnosis of pelvic kidney (Apr) 92-93
WIZENBERG, MJ: Is cancer curable by radiation therapy? (Feb) 67-68

Records
What records must physicians keep? (Feb) 20

Rehabilitation (REHABILITATION SECTION, BALTIMORE CITY MEDICAL SOCIETY)
CARROLL, D: Burden of chronic disease (Apr) 83-86
Exercise and coronary artery disease (Nov) 145-147
Exercise tests in heart disease (Dec) 105-109
Medical care in a Baltimore nursing home (Feb) 63-66
Problems of diagnosis in chronic diseases, Part I (June) 127-128
Problems of diagnosis in chronic diseases, Part II (July) 135-137
Use and abuses of bed rest (Aug) 89-90
CARROLL, D; Brull, R: Personal and social aspects of rheumatoid arthritis (Jan) 105-106
GAINES, ML; Mauchline, D; Nadolsky, J; Miller, A; George, G: Vocational evaluation of handicapped (May) 114-126
GESSNER, JE: Home rehabilitation of the stroke patient (Oct) 105-107
Heart Association of Maryland and its chapters (Mar) 97-98
Physiology of exercise (Sept) 123-125

Retardation (MARYLAND ASSOCIATION FOR RETARDED CHILDREN INC.) **(see also Mental Health)**
BARTOLOS, M: Dermatoglyphics in medicine (May) 143-144
CORKE, GC: Human development (Feb) 82
GRIFFITH, I: Childhood asthma and mental retardation (May) 107
Measles vaccine in prevention of mental retardation (Oct) 109
PEARL, JS: From TB to MR (Apr) 110
Planting seeds of concern (Dec) 126

POMMER, AM: IQ, specific abilities, adaptive behavior (Sept) 129
VALLETUTTI, PJ: Improving communication between special education and medicine (Nov) 137-138

Stroke
GESSNER, JE: Home rehabilitation of the stroke patient (Oct) 105-107

Suicide—see Mental Health
—see Baltimore City Health Department

Thorax
SCHOOLMAN, LR: Case of spontaneous chylothorax (Sept) 46-58

Urinary System
CHASE, HV: Nephrotic syndrome (Jan) 44-54
CROUCH, RD: Urological aspects of urinary tract infections (Jan) 71-74
EVERETT, HS: Urinary stasis and urinary infections in gynecological and obstetrical patients (Nov) 21-31
FURIE, RJ: Urine specific gravity and renal function (Jan) 61-62
MORRISH, HF: Radiographic diagnosis of pelvic kidney (Apr) 92-93
REYNOLDS, RC: Renal medullary needs (Jan) 65-67
SCHOOLMAN, LR: Polycystic disease of the kidneys (Jan) 37-43
Special techniques of intravenous urography (Jan) 77-82

Vascular Disease
CLASSEN, JN; Montague, ACW: Acute thrombophlebitis and its complications (Aug) 25-28
HENDERSON, CM; Adams, JE; Meyer, PD: Carotid artery aneurysms in patient with previously operated ipsilateral carotid aneurysm (Dec) 33-34

Veneral Disease
MARYLAND STATE DEPARTMENT OF HEALTH: Venereal disease films available (Mar) 70
STAUCH, JE: Kopp, WW: New rapid serologic screening test for syphilis (June) 33-39

Woman's Auxiliary

(Jan) 133
